By tabulating the two amounts shown by the bills of the participating customers, we have computed the differences between those figures for all customers availing themselves
3876 —1,755—
of this plan in respective years shown in Exhibit 39.

The figures indicated are the totals derived in that manner.

Q. The exhibit purports to show, does it not, classifications such as residential, rural, commercial, large users and municipal secondary? A. Yes, it does, with the savings segregated according to those classes of service.

Q. And has this table been prepared under your supervision? A. Yes, it has.

3877

Q. And the facts shown taken from the record of the Wisconsin Electric Power? A. They were.

Mr. Hamilton: I offer the table in evidence as Respondents' Exhibit No. 39.

Miss Calkins: No objection.

The Examiner: It is so admitted.

(The table referred to was received in evidence as Respondents' Exhibit No. 39.)

3878

By Mr. Hamilton:

Q. In order to clarify the exhibit, Mr. Schmidtman, would you state the total savings for the period indicated to all classes of customers shown on the exhibit? A. The total

savings experienced by customers participating under the ten-for-one plan, from the date of its beginning up to June 30, 1940, was $4,687,214.62.

Q. And the total savings to residential customers? A. Residential customers realized a total saving of $2,934,641.30.

3879

Q. I note from the table that for the six months ended June 30, 1940, your total amount of savings shown indicates a slight increase in rate of saving over the year 1939. Is that right? A. Did you say a decrease?

Q. An increase. A. Yes, the saving during the first half of 1940 exceeds half the saving for the year 1939.

The ten-for-one plan continues to be extremely popular with our customers, and while it is not to be assumed that the operating results for the first half of the year should be exactly half of the results for the entire year, the continued

popularity of the plan leads us to believe that the savings for 1940 will be of the same order of magnitude as those shown for the preceding three years.

Q. For what period is the plan intended to remain in operation? A. The ten-for-one plan was originally introduced on an experimental basis. It was necessary before offering it to our customers, to submit it to the Public Service Com-

—1,757—

mission of Wisconsin for approval.

3881 After the Commission had become convinced that it was a sound promotional plan, authority to introduce it on an experimental basis was given. It has been extended from time to time by approximately six-months periods, and the latest extension by authority of the Public Service Commission covered a period up to July, 1941.

Whether it will be extended beyond that time no one can say. It will have to be again submitted to the Public Service Commission for analysis by their rate and research division, and if the Commission approves, authority will be granted to extend it farther into the future.

3882 The reason that the plan was introduced experimentally is that it was new and we had no experience on what might be expected from it and so it was approached on that basis. After its promotional nature had been fully demonstrated, however, the Public Service Commission was less hesitant about approving it, and, as I say, it has now been approved to remain in effect up to July of next year.

There are some rather interesting aspects of this plan, one of which can best be illustrated by an example. If a customer consumed 100 kilowatt hours in any month last

year and paid for that consumption at the regular rates for residential electric service, his bill would have amounted to $3.35 net.

—1,758—

Now, if that customer had availed himself of the ten-for-one plan during the corresponding month of this year, he would be permitted to use 200 kilowatt hours for a charge not in excess of 10 per cent. more than $3.35, or a charge of $3.69. He would receive the additional 100 kilowatt hours for an additional charge of 34 cents, or he would pay 34/100 of a cent per kilowatt hour for his increased service. 3884

Now, it isn't to be expected that a customer will continue doubling his consumption year after year. The economic status of a residential customer places some limitation, some saturation point, if you please, on the amount of electricity that a person in his circumstances can use, even though it comes to him at an extremely low rate, so if the customer we are taking as an example should not continue to increase his consumption above the 200 kilowatt hour point, but should continue using 200 kilowatt hours in the corresponding month, year after year, at the end of five years his bill, which would have been increasing at the rate of 10 per cent, 3885 each year under the ten-for-one plan, would be within two cents of exactly what his bill would be for 200 kilowatt hours at the regular rate.

During the five-year period, the customer will have had the use of 200 kilowatt hours each month for amounts ranging from $3.35, which is the standard bill for 100 kilowatt hours, up to $5.35, which is just two cents less than the standard bill for 200 kilowatt hours per month.

—1,759—

3886 *Edward H. Schmidtman—By Respondents—Direct*

During that period, for that same calendar month each year, accumulatively, he would have realized a saving of $4.28. He would have developed consumption habits resulting in the consumption of 200 kilowatt hours per month, and would have received service during that period at premium rates.

Q. Have the operations of the promotional rate plans resulted in an increased use of electrical energy by customers of the company? A. They have. They have resulted
3887 in substantially increased use on the part of our residential customers. The fact that this is true is shown by the shifting of our residential customers from the low consumption brackets to the high consumption brackets.

In 1937, it was decided that analyses should be made to ascertain whether the promotional rate plans were resulting in increased consumption habits on the part of residential customers. As a result of that decision, a complete consumer analysis of the residential customers of the Wisconsin Electric Power Company was made and the customers were classified according to the consumption brackets in which
3888 they fell.

The first of these analyses was made in April of 1937, when it was found that 50 per cent. of the residential consumers of Wisconsin Electric Power Company used 50 kilowatt hours or less per month; 34 per cent. used between 52 kilowatt hours and 100 kilowatt hours per month; 9 per

cent. consumed from 102 kilowatt hours to 150 kilowatt hours per month; 3 per cent. consumed from 152 kilowatt hours to 200 kilowatt hours per month; and 4 per cent. consumed more than 200 kilowatt hours per month.

These consumptions are all per customer. These consumer analyses were repeated, being made in October and again in April and October of each succeeding year.

The latest one available was that made in April of 1940. At that time, it was found that the customers consuming 50 kilowatt hours or less per month per customer had dropped from 50 per cent. to 34 per cent., and those consuming from 52 to 100 kilowatt hours per month had increased from 34 to 40 per cent.; those consuming from 102 to 150 kilowatt hours per month had increased from 9 to 15 per cent.; those 3890
consuming from 152 to 200 kilowatt hours per month had increased from 3 to 5 per cent.; and those consuming more than 200 kilowatt hours per month had increased from 4 to 6 per cent. of the residential consumers of the company.

This shifting of customers from the low-consumption brackets to the higher consumption brackets is regarded as an extremely important accomplishment because customers who use very small amounts of electricity don't make the use of it which really benefits them. They use it only for necessity purposes and get very little comfort or convenience from it, and likewise, customers in the minimum consumption 3891

brackets do not actually pay all the costs of service.

So from the viewpoint of both the customers and the company, we feel that the migration, if you please, of customers from the lower consumption groups to the higher consumption groups is an achievement of some importance.

Mr. Hamilton: May this chart be marked for identification as Respondents' Exhibit No. 40?

3892 *Edward H. Schmidtman—By Respondents—Direct*

(The chart referred to was marked for identification as Respondents' Exhibit No. 40.)

By Mr. Hamilton:

Q. Mr. Schmidtman, will you explain what Respondents' Exhibit No. 40 for identification portrays? A. Respondents' Exhibit 40 is a blueprint chart showing in graphic form the trend of average annual consumption of residence electricity on the system of Wisconsin Electric Power Company and in
3893 the United States as a whole.

Q. Will you indicate the period shown? A. The period covered by the curve for Wisconsin Electric Power Company extends from the year 1910 to the year 1939.

The period covered by data for the United States begins with the year 1913 and carries through to 1939.

Q. Has this chart been prepared under your supervision? A. Yes, it has.

—1,762—

Q. And the facts shown as to Wisconsin Electric Power Company taken from the records of that company? A. They
3894 were, and the data for the average of the United States were taken from the published statistical reports of the Edison Electric Institute.

Mr. Hamilton: I offer the chart in evidence as Respondents' Exhibit No. 40.

Miss Calkins: No objection.

The Examiner: It is admitted in evidence under that number.

(The chart referred to was received in evidence as Respondents' Exhibit No. 40.)

By Mr. Hamilton:

Q. Will you state from Exhibit No. 40, the range shown by the two curves? A. The curve for Wisconsin Electric Power Company shows that in 1910 the average annual consumption of electricity per residential customer was about 210 kilowatt hours, and that in 1939 it had increased to 1,960 kilowatt hours.

The curve showing the average for the United States indicates that in 1913 the average annual consumption per 3896
residential consumer was about 260 kilowatt hours per customer, and in 1939 it was 890 kilowatt hours per customer.

Q. And since what year has the average consumption of Wisconsin Electric Power Company, residential consumers, exceeded the average consumption of the United States? A.

—1,763—

Beginning in the year 1915, the average consumption per residential customer of the Wisconsin Electric Power Company has been above the average for United States.

Q. Continuously? A. Continuously. Prior to 1915, the average for the United States was above that of the Wis- 3897
consin Electric Power Company for the two years shown. I do not have data for the earlier years and so I don't know whether that curve would remain above that of Wisconsin Electric Power Company for the years prior to that or not.

Q. Exhibit No. 40 does not present data as to the operations of the Wisconsin Michigan Power Company and the Wisconsin Gas & Electric Company. Can you give comparable data for those last two named companies? A. Yes. As I explained before, in connection with the average price for residential electricity of Wisconsin Gas & Electric Com-

3898 *Edward H. Schmidtman—By Respondents—Direct*

pany and Wisconsin Michigan Power Company, the residential classification of service has not been segregated until recently, and so we could not plot the data for those companies over the periods shown in Exhibit 40.

For the year 1939, however, the average consumption per residential consumer on the system of Wisconsin Gas & Electric Company was 904 kilowatt hours. For Wisconsin Michigan Power Company, the average residential consumption in 1939 was 932 kilowatt hours.

3899 —1,764—

Both of these figures exceed the average for the United States in 1939.

Q. Have the companies in the Wisconsin-Michigan group carried on active programs directed toward rural electrification? A. Yes, they have. The activity directed toward the sale of electricity to farmers began as far back as 1916 in the territory of our three companies.

On January 1 of that year, Wisconsin Electric Power Company filed its first rural electric service rate schedule with the then Wisconsin Railroad Commission. In filing
3900 its rate for that class of service at that time, the company was far ahead of most electric utility systems in the country, and likewise far ahead of the growing national prominence that has attached itself to rural electrification in recent years.

At that time, the sale of electricity to farms was an entirely new field of electric service. Because of that fact, it was necessary to approach the class of service on a somewhat experimental basis.

In laying out its program for electrifying its rural territory, the company has as its object, the complete electri-

fication of its territory rather than the realization of immediate earnings on the service extended at the time. After a few years of rather careful probing of the field, it was

—1,765—

found that rural service had real possibilities as a means of selling electricity, and the Wisconsin Electric Power Company organized the beginning of its present rural sales division in 1925.

The division was organized of men familiar with fine problems and there were developed in that the plans for 3902 financing farmers' installation and a plan under which line extensions, would be made to farmers applying for service and a rather active campaign was instituted.

The Wisconsin Gas and Electric Co. and Wisconsin Michigan Power have always been in the rural electrification field a number of years, although they had not entered it at the time the Wisconsin Electric Power Co. filed its initial rate schedule in 1916.

They have since carried a law with their rural electrification promotion campaign and have accomplished a high degree electrification of their rural territories. 3903

Q. What are the policies of the companies in the Wisconsin-Michigan group with respect to line extensions in rural territory? A. All three companies of the Wisconsin-Michigan group have at present the same rural line extension policy. The original rules filed by Wisconsin Electric Power Co. provided that the company would expend in constructing new line extensions required in servicing customers an amount not in excess of the estimated revenue for the first

—1,766—

two years of operation of the proposed extension. Any excess in the cost of the line extension over the estimated two years revenue was paid by the customers applying for the service.

In 1924, this rule was amended to provide for the expenditure of three years' estimated revenue, with the customers contributing the excess of cost over that amount.

The rule also provided that if additional customers were connected to the line within the first three-year period, that
3905 one-half of the revenue received from those customers would be refunded to the farmers making the original contribution if it amounted to more than one-third of the cost of connecting such additional customers.

If the customers chose to guarantee a minimum revenue equal to not less than one-third of the cost of the line extension, then the company did not require them to make any contribution in aid of that construction.

In 1924, the rules also provided for the financing of farmers' wiring in their buildings, and the financing of their equipment on a monthly instalment plan.

3906 In 1935, the rules were further liberalized in an experimental area in the rural territory of Wisconsin Electric Power Company. They were changed to provide for a contract for three years' service at a minimum charge of $4.00 per month. Under such a contract, the Wisconsin Electric Power Company agreed to install a rural line extension for

any length provided there was not a distance of more than three-quarters of a mile between any two customers on the extension.

If such customers exceeded three-quarters of a mile, the rule provided that the company might, if it chose, refuse to extend the service.

Now, these rules were filed and approved by the Public Service Commission of Wisconsin. The rules adopted in 1935 by the Wisconsin Electric Power Company are still in effect and have been extended to cover the rural service of both Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company.

Q. Are the rural rates of the three companies promotional 3908
in character? A. Yes, they are. They have been made that way in keeping with the promotional rate policies of the companies in order to encourage more extensive use of the service by our farm customers.

The rates charged for rural electric service are the same on the system of all three companies of the group. They provide for a minimum monthly charge of $4.00 net which is the $4.00 charge I spoke of in connection with the line extension policy.

This minimum charge carries with it the right of the cus- 3909
tomer to consume eighty kilowatt hours of energy, resulting in a net charge for that first step of eighty kilowatt hours of 5 cents per kilowatt hour. —1,768—

The next 420 kilowatt hours per month are billed at 2½ cents per kilowatt hour, and the excess over 500 kilowatt hours per month is billed at 2 cents per kilowatt hour.

The rate also provides for a charge based on the motor installation of the farmers, specifying that for installations of more than 7½ horsepower, the minimum bill of $4.00 is increased by 50 cents a month per horsepower.

3910 *Edward H. Schmidtman—By Respondents—Direct*

Q. Have the companies conducted experiments toward increased rural consumption? A. Yes, they have. A rural electrification project was participated in by Wisconsin Electric Power Company with the cooperation of the Wisconsin Utilities Association, and the University of Wisconsin, in 1927.

The purpose of this project was to develop new and beneficial uses of electricity on the farm.

In carrying out the project, two test farms in the terri-
3911 tory of Wisconsin Electric Power Company were established and were completely wired and equipped with various types of electrical farm equipment.

The tests were conducted under the direction of the university for the purpose of determining the efficiency of the various items of equipment then available for the use of farmers and the cost of operating such equipment and the value of the results of such use. —1,769—

Two general classes of equipment were tested, the first one consisting of household equipment, including refrigera-
3912 tors, water heaters, laundry and cleaning equipment, water systems, and sanitary equipment requiring running water pumped with electric pumps.

The second class consisted of general farm equipment including milking machines, cream separators, feed grinders, incubators, silage cutters, elevators, wood saws, and other general machines for the application of electricity to the farm.

These experiments demonstrated the various ways in which such equipment could be applied to the needs of farmers and many of the items of equipment tested on those

test farms in 1927 are now considered standard equipment among the farmers served in the territories of our companies.

In 1938 another test having to do with rural electrification was conducted by the rural sales division of Wisconsin Electric Power Company. This test consisted of a load survey and metering test on a certain rural distribution line in the company's territory.

The test covered the years '37 and '38, and was conducted on a line eighteen miles long serving fifty-six farms. From those figures, it is evident that the density of customers in 3914 that particular area was not particularly high.

The outstanding fact discovered as a result of these tests, was that during the period of tests the connected load served

—1,770—

by the line, that is the capacity of the equipment connected to the line, increased 24 per cent.. The consumption of electricity on the line increased 32 per cent., while the maximum demand imposed on the line increased by less than 6 per cent.

These results indicate the diversity of demand which can exist and which in this case did exist, naturally, between the various power consuming devices used on farms, and shows 3915 the possibility of building the rural load to profitable levels without making excessive investment in transmission and distribution facilities.

The companies have also carried out extensive tests on the use of electricity for heating the soil in seed beds, and for ultra-violet irradiation of poultry and cattle. Five soil-heating test installations were made to determine the efficiency of equipment available to the market for that use, and the results of these tests indicated that certain brands of such equipment had very practical value to farms and

green houses and others who were interested in getting an early starting of seedlings.

With respect to ultra-violet irradiation of poultry and cattle, Wisconsin Electric Power Company actually pioneered that application of electricity to farm production.

In Wisconsin, the summers are shorter than in other parts of the country and a very large part of the summers are cloudy so that there is inadequate sunshine to give the animals as much of the sunshine vitamin as they need.

3917 —1,771—

Test flocks of chickens were subjected to ultra-violet irradiation and after careful test, it was found that the average increase in number and weight of eggs laid ran close to 20 per cent. for the flocks which received irradiation in comparison with those which did not.

Ultra-violet irradiation is also valuable for use on herds of cattle in that it improves the quality of the milk and reduces the bacterial count in the milk. It also reduces the susceptibility of the cattle to various diseases and has resulted in improved health and growth of calves.

3918 In connection with the application of ultra-violet irradiation on farms, Wisconsin Electric Power Company employed a veterinarian in 1935 and still has him in its employ. To our knowledge it was the first electric utility in the country to employ a veterinarian full time to serve as adviser to farm customers of the company.

This doctor is skilled in poultry and livestock ailments and he assists farmers in the selection, installation and use of ultra-violet equipment. Through his work, the company feels it has received considerable benefit in the way of in-

3919

creased revenue from the customers and increased goodwill among the farmers that we serve.

We now have over 600 installations of ultra-violet or sun lamps in the company's territory.

—1,772—

Q. This is on farms, is it? A. This is on farms, yes. They are using more than a thousand lamps.

Q. Are the results of the experiments conducted by Wisconsin Electric Power Company made available to the Wisconsin Gas & Electric Company, and Wisconsin Michigan 3920
Power Company? A. Yes, they are. Those results are made available to the other companies and where the data involved are applicable to the use of those companies, they actually employ the results of those tests in serving their own customers.

Q. Do Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company have the same facilities for conducting these experiments? A. No, they do not. These experiments are conducted very largely on the system of the Wisconsin Electric Power Company because the company has led the way in rural electrification in the group, 3921
and for that reason the results of these tests and the knowledge that is gained are made available to the other companies so they won't have to duplicate the effort and spend money doing the same thing that has been done by Wisconsin Electric Power Company.

Q. Has the effect of this program been the increased use of electricity on the farm? A. Yes, it has. The consumption of electricity by our farm customers has grown appre-

—1,773—

3922

ciably and we feel it is largely because of the liberal line extension policy, the promotional rates and the general promotional activity carried on by the companies among their farm customers.

Q. Does Wisconsin Electric Power Company conduct programs designed to increase the use of running water on farms? A. Yes, it does. Each year Wisconsin Electric Power Company carries out a program intended to bring to the attention of our farm customers the application of electricity

3923

to at least one specific use on the farm.

The theme of this year's rural sales activity is "Running Water on the Farm". The application to electric service is through the medium of an electric pump delivering water for a pressure system. It has been found, again by means of extensive tests, that hogs will weigh more, cows will give up to 10 per cent. more milk, and chickens will lay more and larger eggs if they have all the water they want when they want it.

The first step in the running water promotional program of the company is the showing in farm homes and at various gatherings of a sound-slide film entitled "Running Water on

3924

the Farm."

This film is presented by a representative of the company who does not attempt to sell any equipment at all. She simply gives the film and the lecture connected with it as a means of arousing interest among the farm population in running water.

—1,774—

The selling of the equipment and the installation of the water systems are done entirely by dealers in the territory who are in those lines of business.

The company does finance the installment accounts, however, for the farmers' installations of wiring and installation of water systems, including the motor, and the pump and the piping.

Last year, Wisconsin Electric Power Company handled accounts amounting to more than $10,000.00.

Q. Those are single accounts, are they? That is not an aggregate figure, is it? A. That is an aggregate figure. The total amount of all accounts handled was over $10,000.00, covering electrical water systems installed in the rural ter- 3926
ritory.

In continuing its running water theme for this year, the Wisconsin Electric Power Company concentrated on that one aspect of rural electrification in its exhibit at the Wisconsin State Fair in Milwaukee.

The exhibit showed various appliances using running water and it was visited by hundreds of people from all over the state and some from outside the state.

Q. Now, have you data as to the number of farms served in the territories of the three companies? A. The three com-
panies, through their rural electrification policies, have ac- 3927
complished a high degree of electrification of their rural territories.

—1,775—

In the rural territory served by Wisconsin Electric Power Company, there are located 3,996 farms.

Q. Will you state the test which is the basis for the definition of a farm used in your testimony? A. We define a farm as an establishment from which the principal revenue is received from agricultural pursuits. There are many farms in our territory which have more than one family.

3928 *Edward H. Schmidtman—By Respondents—Direct*

In such cases, the family which operates the farm as its principal means of income is classified as the farm home, or as the farm family, and the other family or the other residence is considered simply a residence, and if it takes electric service it receives that service at the standard residential rate.

The rural rate is extended only to the operation of the farm, itself, and to the family which operates that farm.

Now, as I said, there are 3,996 farms in the rural terri-
3929 tory served by Wisconsin Electric Power Company. At the end of June, 1940, 3,634 of these farms were taking electric service from Wisconsin Electric Power Company. The number taking service constituted nearly 91 per cent. of the total farms in the territory of the company.

At the same time service was available to 3,840 farms, or slightly over 96 per cent. of the total farms in the territory. Wisconsin Electric Power Company operates 1,090 miles of rural distribution line which averages 3.6 customers per

—1,776—

mile.

3930 In the territory of Wisconsin Gas & Electric Company, there are 17,818 farms. Of these, 13,550, or slightly over 76 per cent., are now being served by Wisconsin Gas & Electric Company.

Service is available to a total of 16,690 of these farms or nearly 94 per cent. of the total number in the territory. Wisconsin Gas & Electric Company operates 4,279 miles of rural distribution line, on which the average customer density is 3.2 per mile.

There are 9,571 farms located in the rural territory of Wisconsin Michigan Power Company, in both Wisconsin and

 3931

Michigan. On June 30, 1940, that company was serving 6,579 of those farms, which represents 68.6 per cent. of the total farms in the territory.

At that time service was available to 8,087 farms or 84½ per cent. of all farms in the territory. Wisconsin Michigan Power Company operates 1,897 miles of rural distribution line in Wisconsin and 572 miles of such line in Michigan and has an average rural customer density of 2.8 customers per mile in Wisconsin, 2.3 per mile in Michigan, or an average of 2.6 in all territory served. 3932

Now, by comparison with the average degree of rural electrification in the State of Wisconsin as a whole, those companies range high. According to data published by the Edison Electric Institute, 42.1 per cent. of the farms in Wis-

consin were receiving electric service at the end of 1939.

All three of the companies of the Wisconsin-Michigan group are substantially above that average, Wisconsin Electric Power Company having an electrification of more than twice the percentage indicated for the state as a whole.

Q. Have you data as to the consumption, average consumption, by rural customers in the territory? A. The average consumption of all rural electric customers of the three companies of the Wisconsin-Michigan group, was 1,367 kilowatt hours in 1939. 3933

According to Edison Electric Institute data, the average consumption for rural customers east of the one-hundredth meridian, which generally divides the portion of the United States in which irrigation is practiced, from that in which little or no irrigation is practiced, was 1,127 kilowatt hours per customer. The average for the three companies of the

3934 *Edward H. Schmidtman—By Respondents—Direct*

Wisconsin-Michigan group exceeds the average for that portion of the United States east of the one-hundredth meridian by 21 per cent.

The average cost of service to customers of the Wisconsin-Michigan group was 4.1 cents per kilowatt hour which was 7 per cent. below the average cost of service of 4.41 cents per kilowatt hour in that portion of the United States east of the one-hundredth meridian.

In 1939, Wisconsin Electric Power Company's rural cus-
3935 tomers consumed an average of 2,229 kilowatt hours per cus-
—1,778—
tomer, and for that service they paid an average price of 3.02 cents per kilowatt hour. This average consumption is 87 per cent. above the average for the non-irrigated portion of the United States, and the average price for service in the non-irrigated section of the United States is 36 per cent. above the average price charged the rural customers of Wisconsin Electric Power Company.

Q. When you refer to the territory of the United States east of the one-hundredth meridian, you have referred, have
3936 you not, to the territory in which little or no irrigation is practiced? A. Yes, that is what I meant.

The Examiner: We have come through to this hour of 1:30 without substantial interruption and as this room is to be used this afternoon by a hearing before the Commissioners, we will recess until tomorrow morning at 10:00 o'clock.

(Whereupon, at 1:35 o'clock p.m., the hearing was adjourned until 10:00 o'clock a. m., Tuesday, September 24, 1940.)

—1,779—

3937

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.* 3938

Hearing Room 609,
Securities and Exchange Commission Building,
Washington, D. C.,
Tuesday, September 24, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.* 3939

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, and

MISS E. H. CALKINS, Attorneys for the Securities and Exchange Commission.

3940 *Edward H. Schmidtman – By Respondents—Direct*

PROCEEDINGS

The Examiner: The hearing will be resumed.

Whereupon, EDWARD H. SCHMIDTMAN resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Schmidtman, are Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and the Wisconsin
3941 Michigan Company all subject to the regulation of the Public Service Commission of Wisconsin? A. Yes, they are.

Q. And in addition, is Milwaukee Electric Railway and Transport Company, the transportation subsidiary of Wisconsin Electric Power Company, also subject to the jurisdiction of that Commission? A. It is.

Q. And in addition, is Wisconsin Michigan Power Company subject to the jurisdiction of the Michigan Public Utilities Commission? A. It is with respect to its operations in the State of Michigan.

Q. A previous witness has testified as to what the Wis
3942 consin Commission does with respect to regulation of public utilities and has indicated its powers in that respect. Would

you now state what the companies, themselves, do pursuant to that regulation? A. With respect to the companies' operations, the companies of the Wisconsin group do a number of things in connection with the regulation to which they are subject.

In the establishment of rate schedules for all classes of service, the companies file with the Public Service Commission of Wisconsin and in the case of the Wisconsin Michigan

3943

Power Company rates for service in the State of Michigan are also filed.

These rates must be submitted for approval of the regulatory bodies and that approval obtained before the rates can be made effective.

Q. And they are so submitted? A. And they are submitted and such approval is obtained.

Wisconsin Electric Power Company, now, has in effect thirty-nine electric service rate schedules and forty-five special agreements covering special contracts with other electric utilities and with certain special customers and with municipalities for street lighting service. All of these rate schedules and special agreements have been submitted to the Public Service Commission of Wisconsin and the approval of that body has been obtained.

3944

Wisconsin Gas & Electric Company has twenty-four electric service rate schedules and seven gas rate schedules, as well as a total of seventy-six special service agreements and

—1,782—

street lighting agreements.

3945

These have also all been submitted to and approved by the Public Service Commission of Wisconsin.

Wisconsin Michigan Power Company has nineteen electric service rates and four gas service rates in Wisconsin, as well as forty-nine special agreements and street lighting agreements. These have been submitted to the Public Service Commission of Wisconsin and approved by that body.

Wisconsin Michigan Power Company also has fourteen electric service rates in Michigan and forty-four special agreements and street lighting agreements.

3946 *Edward H. Schmidtman—By Respondents—Direct*

These rate schedules and agreements have all been approved by the Michigan Public Utilities Commission.

I testified yesterday as to the number of rate reductions that have been made by the companies of the Wisconsin-Michigan group in very recent years, amounting to a total of 229 electric service rate reductions.

Q. In the case of the three companies? A. In the case of the three companies, yes. These reductions were all approved by the regulatory bodies under whose jurisdiction
3947 they come before being made effective. The rendering of service by the three companies of the Wisconsin-Michigan group is also done under rules which are filed with the regulatory bodies and approved by those bodies before being made

—1,783—

effective.

At the present time——

Q. (Interposing) Now, in order to clarify your statement, I wish you would indicate that when you refer to regulatory bod'es, you are referring to the state commissions to which the companies are subject. A. Yes. That is what I
3948 mean by the respective regulatory bodies; that is, the Wisconsin Public Service Commission for operations in Wisconsin and the Michigan Public Utilities Commission for operations in Michigan.

At the present time there is now in negotiation between the Public Service Commission of Wisconsin and the electric utility companies operating in Wisconsin a set of rules governing the rendering of service by those utility systems.

The Public Service Commission formulated these rules upon its own motion as a proposed substitute for the rules

presently in effect. The list formulated by the Commission included seventy-four rules.

The electric utilities in the State were represented at a hearing at which these proposed rules were discussed and the utilities subsequently submitted a list of forty-two rules which they offered as a substitute for the seventy-four proposed by the Public Service Commission.

Another hearing was held and the matter is now being considered by the Commission's staff and it is expected that an order ordering certain of these rules to become effective 3950

—1,784—

will be issued by the Commission.

Q. Will you describe the general nature of these rules? A. Yes, these rules cover three general subjects concerning the rendering of electric service.

The first group is in the furnishing of service, itself, and includes rules covering such topics as service requirements, the filing of information with the Public Service Commission of Wisconsin, the non-discriminatory application of rates, the obligation of the utilities systems to furnish service, requirements pertaining to tamper-resistant equipment, billing 3951 periods, standard utilization equipment, changes in type of service, and a number of others of a similar nature.

Altogether there are twenty-one rules concerning the furnishing of service.

The second classification of rules covers the operation of a utility plant. There are twenty-three rules in this group. When I give the number of rules, I am referring to the number contained in the list proposed by the Public Service Commission. In this second class are rules concerning the ade-

3952 *Edward H. Schmidtman—By Respondents—Direct*

quacy of plant, that is generation, transmission and distribution facilities, the periodic inspection of structures and equipment, service interruptions, voltage regulation, electrolysis and tree trimming.

The third group of rules contain a total of thirty rules —1,785— covering metering, tests, and meter accuracies. Among these rules are some covering the measurement of customer service, the type of instruments to be used, the location of meters, 3953 types of testing equipment, the checking of test standards by the Public Service Commission of Wisconsin, the accuracy requirements of meters, test procedures, and numerous others of a similar nature.

Upon complaint by customers concerning quality of service or rates or any other matter having to do with the rendering of service to the public, the companies must answer all inquiries made by the Public Service Commission and if hearings are ordered, they prepare material and exhibits and have witnesses at those hearings to represent the companies in the matters brought up.

3954 These matters may be brought up on complaint of customers or they may be brought up at the request of the companies, or upon motion of the Commission, itself.

In any event, the companies make appearances and represent their interests at such hearings or conferences which may result from instances of this kind. In certain cases, where construction is contemplated or changes in the operation of the electrical system that is proposed, the companies must make application and do make application to the Commission, the Wisconsin Michigan if it is in Wisconsin, or if

it is in Michigan, to that state commission, for authority to

—1,786—

make the contemplated installation.

Among the instances in which such certificate must be obtained, are cases in which the construction or operation of the electric and gas service in any incorporated city or village, not previously served by the utility, is contemplated. That is, an extension of service into any territory not previously served may not be made without specific approval of the Commission. 3956

Q. And you do make application for such approval? A. We do make application and we do obtain such approval before making such extensions of service.

In case an addition to an electric generating station or gas manufacturing plant is contemplated, or the replacement or change of any of its equipment, the companies apply to the Public Service Commission for a certificate of authority to make such changes.

Before constructing any new transmission line, which will interconnect two sections of the system not previously interconnected, or which will bring into the system a new 3957 source of power or will materially change the power supply to any principal load center within the system, or which involves gross property additions in excess of 2 per cent. of the previous year's gross electric operating revenue, the companies apply to the Public Service Commission for certificate of authority to make such construction and the certificate must be obtained before the construction may be made.

—1,787—

If the companies should desire to construct or enlarge any major sub-station which would effect the changes I have

just enumerated above in its electrical system, they also apply to the Public Service Commission for certificate of authority before making such construction.

Before constructing a building, or making other property additions in excess of 2 per cent. of the previous year's gross electric operating revenue, a certificate of authority is applied for and obtained.

Q. In the case of gas service, do you similarly make application for certificates of authority? A. Yes, we do. The
3959 rules apply to gas operations as well as to electric.

Under certain conditions the extension of relatively short lengths of line, sometimes less than a mile in length, will accomplish one of these changes which I have enumerated, making it necessary for the companies to obtain permission of the Public Service Commission before construction of such sections of line.

An instance of that would be where a line would be extended into a community or area not previously served.

Q. All these instances which you have given are related to regulation by the Wisconsin Commission? A. Yes, they
3960 are. Another respect in which the companies comply with

regulatory authority, is in connection with the execution of contracts and agreements between affiliated interests. In compliance with the Public Service Commission of Wisconsin's order 2-U-2, issued in June of 1931, all contracts of Wisconsin utilities between affiliated interests must be filed with the Public Service Commission and the approval of that body obtained.

Q. And you do make such filing? A. We do make such filing and we do obtain such approval.

Q. Will you illustrate generally the nature of the type of arrangement covered by that rule? A. An example of this type of contract is the agreement that was entered into between Wisconsin Electric Power Company and its transportation subsidiary, The Milwaukee Electric Railway and Transport Company.

In October, 1938, the Milwaukee Electric Railway and Light Company, which was the predecessor in name of the Wisconsin Electric Power Company, separated its transportation operations from its electric operations. 3962

The transportation operations were organized under The Milwaukee Electric Railway and Transport Company as a wholly owned subsidiary of Wisconsin Electric Power Company which now conducts the electric operations.

In separating the transportation from the electric operations of The Milwaukee Electric Railway and Light Company, it was necessary to make certain arrangements re-

garding the joint use of property which up to that time had been used jointly in both electric and transportation operations. 3963

Inasmuch as the two businesses were thenceforth to be operated by separate companies, a contract was entered into between them covering the joint use of certain facilities. These contracts were submitted to the Public Service Commission for approval.

Before giving approval of the proposed agreements, Wisconsin Public Service Commission sent an auditor to the offices of the companies at Milwaukee to audit the proposed agreements and the facts concerning them. All the property

3964

figures upon which rentals were computed were checked by the auditor against the property ledger accounts and the determination of the rental rates was also investigated.

The Commission's auditor prepared a complete report on the results of his investigation, copy of which was submitted to the companies for review. After submission of the auditor's report, a conference was held by the representatives of the Commission and of the companies, the purpose of which was to answer any questions which the Commission

3965 wished to ask as a result of the report submitted by the auditor.

As a result of this conference, the Public Service Commission issued an order finding that the proposed arrangements were in the public interest and ordering the Wisconsin Electric Power Company to submit annually a detailed

—1,790—

schedule of all properties involved in the rental arrangement and of all the elements of cost entering into the furnishing of electric power service to The Milwaukee Electric Railway and Transport Company by Wisconsin Electric Power

3966 Company.

Wisconsin Electric Power Company has subsequently submitted such report to the Public Service Commission as of the end of 1939.

Q. Was part of that arrangement of the power contract entered into between the two companies? A. Yes.

Q. And was this similarly filed with and approved by the Commission? A. Yes, the power contract was considered by the Public Service Commission along with the rental arrangement, and the rate charged for power was examined as care-

fully by the Commission's staff as were the rentals proposed to be charged for the property, at least to the transport company.

Another arrangement in which a contract between affiliated interests was filed with the Public Service Commission and approval of that body obtained before the contract was made effective, arose in the case of the purchase of a piece of electrical equipment by Wisconsin Electric Power Company from the Illinois-Iowa Power Company, an affiliate.

In constructing the 96th Street Sub-station, the Wisconsin Electric Power Company found itself in need of certain 3968

—1,791—

electrical equipment among which was a 132,000 volt oil circuit breaker.

The company obtained bids on such equipment from the General Electric Company, the Westinghouse Electric Manufacturing Company, and the Condit Company, these bids ranging from about eighteen thousand—well, ranging from $17,800.00 to slightly over $18,000.00.

Before placing an order for this breaker, however, Wisconsin Electric Power Company learned that Illinois-Iowa 3969 Power Company had an oil circuit breaker which would fill the purpose and which it desired to dispose of.

Contact was established with the company and terms of purchase were agreed upon, but before going through with the transaction, Wisconsin Electric Power Company applied to Wisconsin Public Service Commission for authority to enter into the purchase contract and carry out the purchase arrangement.

There were some details that had to be worked out in this connection inasmuch as the circuit breaker actually

3970 purchased—the circuit breaker which Illinois-Iowa Electric Power Company had for sale, had a reclosing time of 35 cycles, whereas the requirements of Wisconsin Electric Power Company didn't require quite as rapid operation as that.

Because of that fact, the circuit breaker owned by Illinois-Iowa Power Company was of a higher quality and a higher cost than was the type of breaker on which Wisconsin Elec-

—1,792—

3971 tric Po er Company had obtained bids from manufacturers.

In negotiating with Illinois-Iowa Power Company, Wisconsin Electric Power Company insisted that it would not pay anymore for the breaker than it would cost the company to buy new the kind of breaker which its requirements called for and an agreement was reached with the Illinois-Iowa Power Company for the purchase of that oil circuit breaker for $17,880.00, but before the purchase was made, approval was obtained from the Public Service Commission of Wisconsin.

Q. And when did this instance take place? A. That pur-

3972 chase was made in—that was quite recently.

Q. Approximately. A. I believe it was in 1940. It was in this year, the early part of this year.

Another contract between affiliated interests which was submitted to the Public Service Commission of Wisconsin for approval, is the reciprocal pole contract agreement now in effect between Wisconsin Electric Power Company and Wisconsin Gas & Electric Company.

This agreement provides that where the lines of the two companies followed the same course, that each company may

place its wires on the poles of the other if there is room for such wires on those poles, without paying any rental for the use of such contacts.

—1,793—

The arrangement is reciprocal in that each company has the privilege of using the poles of the other and is made on that basis, in order to avoid extensive accounting for numbers of contacts and billing for the use of such property.

Wisconsin Public Service Commission has approved this contract arrangement between the two companies. Some of 3974
these contracts which I have described and will describe were in effect prior to the issuance of the Public Service Commission's order requiring the filing of contracts between affiliates.

Those contracts which were in effect at the time the order was issued, were immediately reported to the Public Service Commission of Wisconsin for approval and subsequent to that time, all contracts, between the affiliated companies are reported to the Commission and the approval of the Commission is obtained before the contracts are made effective.

Another arrangement between affiliated companies and 3975
one which was in effect before the issuance of the order requiring the filing of such contracts, is the arrangement between Wisconsin Electric Power Company and Wisconsin Gas & Electric Company, and between Wisconsin Electric Power Company and Wisconsin Michigan Power Company, under which Wisconsin Electric Power Company acts as transfer agent and also handles the payment of dividends on preferred stocks of the other two companies.

Q. Are those operations carried on at the main office of

—1,794—

3976 *Edward H. Schmidtman—By Respondents—Direct*

the Wisconsin Electric Power Company in Milwaukee? A. Yes, they are. This contract was reported to the Public Service Commission immediately upon the issuance of its order concerning such contracts and the approval of the Commission was obtained.

In connection with this same order of the Service Com-...ssion of Wisconsin, the three companies of the Wisconsin-Michigan group of North American properties have submitted to the Public Service Commission information as to the
3977 affiliation of all directors and officers and the names of the holders of 1 per cent. or more of the voting capital stock in each of the companies.

At the present time, the companies report annually the twenty largest holders of common stock and preferred stock to the Public Service Commission of Wisconsin.

The Wisconsin Public Service Commission also exercises extensive control over the accounting practices of public utilities and the three companies of the Wisconsin-Michigan group comply with the requirements of the Commission in this respect. Beginning as far back as 1908, when the Rail-
3978 road Commission of Wisconsin was given jurisdiction over public utilities, the companies have complied with Commission requirements respecting classifications of accounts.

The most recent classification under which the electric and gas utilities in Wisconsin are operating, are the Uniform System of Accounts for electric utilities and the Uniform

System of Accounts for gas utilities, both of which became effective January 1, 1938.

These classifications are substantially in accord with the system of accounts for electric utilities approved by the

National Association of Railroad and Utilities Commissioners, and also substantially in accord with the classification of accounts ordered by the Federal Power Commission as of January 1, 1937.

These classifications completely prescribe what accounts shall be kept and specify just what items shall be charged and credited to each account. This classification of accounts covers all balance sheet accounts and all accounts in which revenues and expenses are recorded.

The companies of the Wisconsin-Michigan group comply 3980
fully with the requirements of the Public Service Commission in this respect. The three companies of the Wisconsin-Michigan group also filed with the Public Service Commission of Wisconsin their estimates of the average annual rates of depreciation required for the various classes of fixed capital used for public utility purposes, and also the composite annual rate of depreciation required for fixed capital in the aggregate.

These estimates are submited to the Wisconsin Public Service Commission for review and for certification, and such certification is obtained before the rates submitted by the 3981

companies are put into effect in making provisions for depreciation.

Also, pursuant to the request of the Public Service Commission, comprehensive studies of the company's estimate of depreciation requirements were submitted by The Milwaukee Electric Railway and Light Company, the predecessor in name to the Wisconsin Electric Power Company, on November 1, 1933, and again by Wisconsin Electric Power Company on December 29, 1938.

3982 *Edward H. Schmidtman—By Respondents—Direct*

Such reports were submitted by Wisconsin Gas and Electric Company on January 31, 1934, and again on June 30, 1938, and by Michigan Power Company on December 30, 1938.

In compliance with the Public Service Commission's requirements concerning depreciation rates, the companies have repeated their analyses of depreciation requirements so as to keep the depreciation rates currently in effect closely in step with the latest depreciation experience which it does
3983 have available.

In further regard to depreciation practices, the companies of the Wisconsin-Michigan group comply with the requirements of the Public Service Commission of Wisconsin with respect to the methods of accruing depreciation as well as with respect to the rates to be used in such accruals.

The utilities are permitted—that is, the utilities of this group—to employ the sinking fund method of depreciation upon specific approval of the Public Service Commission.

—1,797—

In its Uniform System of Accounts for electric and gas
3984 utilities prescribed by the Public Service Commission to be effective January 31, 1938, the Commission has conditioned the use of the sinking fund basis of accumulating depreciation upon the filing within a limited time of statements requesting the use of the sinking fund method.

Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company have filed such statements and have obtained from the Public Service Commission of Wisconsin, an order authorizing the following of the sinking fund method of accruing depreciation.

 3985

With respect to fixed capital accounting, the companies of the Wisconsin-Michigan group also conform to the requirement of the Public Service Commission of Wisconsin and in the case of the Wisconsin Michigan Power Company, the Public Utilities Commission of Michigan.

In a letter dated April 10, 1935, and in a general order issued in November of 1935, the Public Service Commission of Wisconsin required the establishment of certain detailed fixed capital records for the keeping of a so-called continuous inventory or a unit record of property and plant. 3986

Pursuant to the requirements of that order, the Commission has supervised the taking of inventories and the establishment of unit property records by all three companies in the Wisconsin-Michigan group.

—1,798—

Prior to the issuance of the Commission's letter and order requiring the establishment of continuous inventory property records, the companies of the Wisconsin-Michigan group were keeping detailed fixed capital records covering all additions and all retirements of property and plant.

These fixed capital records were based upon initial inventories and included all additions and removals from the dates of those inventories down to the present time. The inventory of Wisconsin Electric Power Company which formed the basis for the property record, was one taken in 1914. 3987

The property record of that company was not instituted until about 1922, but during the succeeding years, all additions and removals of fixed capital of the Wisconsin Electric Power Company since 1914 were carefully analyzed by the property and plant accounting division of the general accounting department. Detailed work order and retirement

3988 *Edward H. Schmidtman—By Respondents—Direct*

analyses were prepared covering each construction job and each retirement order, and at the time of the issuance of the Commission's order and letter, Wisconsin Electric Power Company's fixed capital record was an accurate account of all property in service at that time.

The fixed capital records of Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company were likewise based upon inventories and appraisals taken in earlier years, supplemented by detailed analyses of additions
3989 and removals up to the present time.

—1,799—

The continuous inventory records which are now being established by the three companies of the group are in accordance with the requirements laid down by the Commission in its letter and order requiring the establishment of such records. The records being established by the three companies are not identical in type, the difference being due to the difference in nature of the systems and the convenience and efficiency of keeping records in the different volumes re-
3990 quired by the three companies.

The record being kept by the Wisconsin Electric Power Company will be the most detailed unit property record kept by any electric utility in the State of Wisconsin. It is now being developed for overhead transmission and distribution property and will consist basically of punched cards, each card representing one unit of property.

There will be altogether over a million units of property represented by over a million cards, covering the overhead transmission and distribution facilities only. This record is in considerably more detail than is required by the Public

Service Commission, but the added detail was decided upon by Wisconsin Electric Power Company because of value which the company would receive from having a record of that kind.

The records being developed by Wisconsin Gas & Electric Company and the Wisconsin Michigan Power Company are in less detail, but are still sufficiently detailed and are capable of sufficiently searching controls to completely sat-

—1,800—

isfy the requirements of the Commission. 3992

The three companies of the Wisconsin-Michigan group also comply with requirements of the Public Service Commission of Wisconsin and the Michigan Public Utilities Commission with respect to detailed annual reports covering financial and statistical, as well as accounting data.

At present separate annual financial and operating reports are submitted by the utilities. Both reports are very extensive and cover detailed data on the companies operations. The companies also furnish currently to the Commissions copies of their monthly financial and operating reports.

3993

The companies of the group also comply with the requirements of the Public Service Commission of Wisconsin with respect to the reclassification of the utilities' plant on the basis of original cost. Report covering extensive investigations of the records of the three companies have been filed with the Public Service Commission of Wisconsin, setting forth the reclassification of property on the original cost basis.

In addition to submitting reports covering the operations and financial results of the electric utility and gas

utility operations, the companies also comply with the Commission's authority covering the merchandising of electrical and gas appliances.

In the case of acquisitions of utility properties, such as

—1,801—

the purchase of small isolated systems; the three companies comply with Commission requirements with respect to accounting and price paid for such properties. The accounting that is carried out is strictly in accordance with the Com-
3995 mission requirements and if the price paid for the property differs from the values found by the Commission, the differences must be accounted for according to instructions by the regulatory Commission.

Q. Are the companies in the group subject to regulation by the State Commission with respect to issuance of securities? A. Yes, they are.

Q. And do they file applications with the Commission with respect to such issuance? A. Yes. The companies of the group have not issued any securities since 1907 without first obtaining authority from the Public Service Commis-
3996 sion.

All proposed issues of securities of whatever type, must be submitted to the Commission for examination and approval before being issued, and all issues of securities made by the three companies have had such certificates of approval from the regulatory authorities.

Q. In the case of Wisconsin Michigan Power Company, doesn't that also mean getting the approval of the Commission for the issuance of securities? A. Yes.

Q. So that in that instance you have duplicate regulation

—1,802—

of the issues, of the same security issues? A. Yes, that is right. When the Wisconsin Michigan Power Company wishes to issue securities, such issues must have the approval of the Michigan Public Utilities Commission as well as of the Wisconsin Public Service Commission.

Pursuant to the authority of the Commissions over the issuance of securities, the Wisconsin-Michigan companies have filed numerous applications, some of the recent ones being the application of the Wisconsin Michigan Electric Power Company filed February 20, 1940, for authority to 3998
issue 4¾ per cent. preferred stock and common stock, the application filed by Wisconsin Gas & Electric Company on June 19, 1939, for authority to issue 4½ per cent. preferred stock and 2¾ per cent. unsecured promissory notes, and the application of the Wisconsin Michigan Power Company, filed on October 30, 1939, for authority to issue 4½ per cent. preferred stock, 2½ per cent. promissory notes, and common stock.

Applications filed with the Commissions covering these issues contain statements as to the purpose, the terms, and the proposed distribution of the proceeds of the sale of such 3999
securities.

They also stated the minimum price and gave various financial information such as income statements, balance sheets, and pro forma statements showing the effect of the proposed transactions.

—1,803—

After application for the issuance of securities has been filed with the Commission, public hearings are held wherever it is deemed possible, by the Commission, that the interest of third parties may be affected.

4000 *Edward H. Schmidtman—By Respondents—Direct*

In the case of Wisconsin Electric Power Company, for instance, such hearings have been attended by representatives of the City of Milwaukee, the representatives appearing at such hearings in the public interest.

Q. Now, without going into detail on questions of form of application and hearings, subsequent to the entry of the Commission's orders approving the issuance of securities, are further reports filed by the companies with respect to the application proceeds and other related matters?

4001

The Witness: Will you read the question?

(Whereupon the pending question was read by the reporter.)

The Witness: Yes, such reports are required by the Commission.

By Mr. Hamilton:

Q. And are filed by the companies? A. Yes, and are filed by the companies. These statements set forth complete descriptions of the transactions, the detailed accounting for the proceeds received from the sale of the securities, and the disposition of such proceeds, and copies of the journal entries reflecting the transactions on the books of the company have also been filed in such reports.

4002

—1,804—

Q. Proceed with your statement. A. The approval of the Public Service Commission of Wisconsin and the Public Utilities Commission of Michigan is also required in the case of the consolidation or acquisition of the property or securities of one utility by another.

In such instances, the Commission holds public hearings and considers the reasonable value of the property or securities involved and gives consideration to the effect of the proposed transactions upon the utility merging or acquiring such properties or securities.

Similar consideration is given by the Commission to the sale or leasing or renting of any utility property constituting a complete operating unit or system.

Pursuant to the authority of the Commission, the companies have, on numerous occasions, applied for and received 4004
authorization, some including the consolidation of the former Wisconsin Electric Power Company with the Milwaukee Electric Railway and Light Company, the sale of certain transportation properties of the former The Milwaukee Electric Railway and Light Company to The Milwaukee Electric Railway and Transport Company, the present transportation subsidiary of the Wisconsin Electric Power Company, and the acquisition by Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company of numerous small operating utility systems from time to time, some involving a consideration of as little as $800.00. 4005

No abandonments or discontinuance of service of any line, nor any extension of service into new territory, may be made, nor has been made by the companies of the Wisconsin-Michigan group without first securing specific approval from the Wisconsin Public Service Commission.

In granting its approval to abandon property, the Commission may impose such terms or requirements as are necessary to protect the public interest and it does impose such requirements.

Among those requirements are specifications as to the accounting for the book value of the property abandoned, the method of amortizing the investment, and the establishment of substitute service for the service discontinued.

Q. Have you any data as to the expense to the companies of the Wisconsin-Michigan group of complying with regulation by the Wisconsin Commission? A. Yes, I have. In the year 1939, the total costs incurred by Wisconsin Electric Power Company in complying with the requirements of all
4007 regulatory authorities, was $102,500.00.

Q. My question relates only to the Wisconsin Commission. A. The expenses incurred by Wisconsin Electric Power as the result of regulation by the Public Service Commission of Wisconsin in 1939 amounted to slightly over $96,000.00. For Wisconsin Gas & Electric Company, the corresponding figure is slightly over $40,000.00, and for Wisconsin Michigan Power Company the cost of regulation by the Wisconsin

Public Service Commission was slightly over $8,500.00.

Q. Are those figures which you have given exclusive of
4008 any financing charges? A. Yes, they are.

Q. Do they include your direct labor at cost in connection with the reports and statistical findings? A. Yes, they include direct labor at actual cost and they also include assessments paid to the Commission by the companies to cover costs of investigations conducted by the staff of the Public Service Commission.

These assessments consist of two general classes. In ordering an investigation of any phase of the business of a public utility in Wisconsin, the Public Service Commission may

and frequently does order the cost of such investigation to be assessed directly against the company investigated.

In addition to such assessments the Commission makes, near the end of each fiscal year, what is known as a remainder assessment, which is made in order to cover the costs of the Commission over and above the money collected by the direct assessments of specific investigations.

The figures which I have given include both the direct assessments and the remainder assessments.

4010

Q. In order to clarify your statement, isn't it true that the figures which you have given are exclusive of any filing

—1,807—

fees in connection with the issuance of securities? A. Yes, that is true. These costs which I have just given come about partly through investigations which the Public Service Commission has had under way in the offices of our three companies for some time.

Since 1932, the Public Service Commission has had representatives working continuously in the offices of one or more of the three companies of the Wisconsin-Michigan 4011 group down to the present time.

At times, the number of Commission representatives working in the office of one company has found as great as six or seven individuals, and at one time during that period have the forces been entirely withdrawn.

There have been short interruptions due to sicknesses and vacations, but the people of the Commission's staff assigned to those investigations have been spending full time on these investigations.

4012 *Gould W. Van Derzee—By Respondents—Direct*

Q. Do either Wisconsin Gas & Electric Company or Wisconsin Electric Power Company own or operate any electric or gas transmission or distribution facilities outside of the State of Wisconsin? A. No.

Q. Either of the two companies which I have just named transmit or distribute electric energy or gas outside of the State of Wisconsin? A. No, they do not.

—1,808—.

4013 Mr. Hamilton: That is all.

Miss Calkins: I should like to defer cross examination until this afternoon.

The Examiner: Very well. You may be excused temporarily.

Whereupon, GOULD W. VAN DERZEE, a witness called on behalf of the Respondents, having been first duly sworn, was examined and testified as follows:

Direct Examination by Mr. Browning:

4014 Q. Will you give your full name and address to the reporter, Mr. Van Derzee? A. Gould W. Van Derzee.

(Discussion off the record.)

Q. Did you give your residence? A. My residence is Whitefish Bay, Wisconsin.

Q. Will you describe briefly your education and business experience? A. Well, I had better go back to the beginning. I was born in Albany, New York, January 8, 1886, and at the age of four my parents moved to Superior, Wisconsin.

After three years there, they moved again to Green Bay, Wisconsin, where I attended the grade school for seven years, until about 1900. Then the family moved to Chicago and I had one year in grade school and thus finished the grade

—1,809—

school, and one year in high school. We then moved back to Wisconsin, which was becoming our native land and I finished my secondary education first in the high school in Milwaukee, being there for three years, and then took my university education at Madison, Wisconsin. 4016

My course was electrical engineering and in 1908 I received the degree of bachelor of science in electrical engineering.

Q. This was at the University of Wisconsin? A. That is right. Before I went to the university, I had the idea that I wanted to get into what was then known as the Central Station Business, now the Public Utility Business. I thought the best way to do that was to gain employment with some large electrical manufacturing concern, but when I graduated, it was shortly after the money panic of 1907 and I was unable to get into the shops of the General Electric Company 4017 where I really wanted to go, so I took a position in the Michigan School of Mines at Houghton, Michigan, teaching mathematics, physics and electrical subjects, until the summer or 1910.

Then, I was able to follow my original intent and secured a position with the General Electric Company in the shops, if you can call that a position. You can better call it a job.

From July, 1910, until about February, 1911, I worked in the shops of the General Electric Company at Schenectady, on the sixty-hour a week night shift. We did shop work,

4018 tested and assembled electric equipment of all kinds, direct

—1,810—

current motors and generators, alternating current motors of the squirrel cage and slip ring type, synchronous motor generator sets, and I even worked, I recollect, on balancing the rotor of one of the large vertical turbines that were going through the shop then and which was destined to go to the company that I am working for now.

In February 1911 I applied for an examination to get into
4019 the sales work in the General Electric Company. You had to face some barrier of sales experts and give them, by questioning on their part, what you knew about the work you had taken in the shops. I was able to pass that examination and in February 1911 I landed in the Chicago office of the General Electric Company in sales work. There I assisted one of the salesmen, a rather mediocre job.

Shortly after that in May 1911 the General Electric Company decided to open up an office in Milwaukee and that was heading towards my home town so I applied for a position as assistant to the one-man manager who was to go there
4020 and fortunately for me I secured the position.

In a little while I had a sales quota to accomplish during the year, that is a designated amount of goods to sell, and for the next year or so, to be exact until March 1, 1913, I was selling from door to door, gaining experience in the sales work which I was really very much interested in. The work was quite largely going into factories, observing the then

—1,811—

very prevalent line shafting that you would see in a factory driven by an individual gas engine or steam engine, and endeavoring to show the owner how he could save money by

buying the motors and equipment which I had to sell, and figuring out for him where those motors should go using individual drive and doing away with friction losses, doing away with the steam engine and some saving in labor.

So I worked in that way for the period of time indicated, trying to cooperate as much as possible with the utility then known as The Milwaukee Electric Railway and Light Company which was in that city, which did the central station or public utility business, March 1, 1913 was a very important date for me. When vice president S. B. Way, who is now 4022 president of Wisconsin Electric Power Company, the successor to the then The Milwaukee Electric Railway and Light Company, called me in his office and offered me a job which I took as assistant to him.

In 1918—skipping over the intervening years—I was appointed assistant general manager of the company, in 1925 vice president and assistant general manager. In 1932 I was elected to the board of directors, and in 1934 was appointed general manager and a member of the executive committee, and from that time until the present I have held the position of vice president and general manager. 4023

—1,812—

I am also vice president and director of The Milwaukee Electric Railway and Transport Company which is a wholly-owned subsidiary of the Wisconsin Electric Power Company, a vice president and director of Wisconsin Gas and Electric Company, and a vice president and director of Wisconsin Michigan Power Company, and have been the vice president of each since 1932.

I hold the position of vice president and director of Wisconsin General Railway, also a subsidiary of Wisconsin

4024 Electric Power Company, and am vice president and director of Milwaukee Light, Heat and Traction Company, and vice president and director of Hevi-Duty Electric Company.

Q. How long have you resided in Milwaukee or its suburbs? A. I have been continuously in Milwaukee and its suburbs for approximately 29 years, of which I have been with the company going on 28 years. In the village of Whitefish Bay, which has a population now of about 10,000, I have served as trustee of the Village board for three consecutive
4025 terms of two years each. During that time I was chairman of the finance committee and chairman of the zoning and park committee. I have been president of the Community Church of the village of Whitefish Bay.

In the metropolitan area my outside duties have included active participation in the work of the Traveler's Aid Society, the Family Welfare Association, with which I worked intimately on their case committees, and the Community Fund.

Q. Those are community activities of greater Milwaukee?

—1,813—

4026 A. That is true, and in general I have tried to do my share at least, as I saw it, in the community activities of the city where I make a living and where I have lived with little exception almost continuously, except when I was away at a few of the jobs enumerated, for nearly 40 years.

—1,814—

Q. Are you a director of a Milwaukee bank? A. I am a director of the Marshall and Ilsley Bank. This bank is the oldest bank in what was once known as the Northwest Territory and it is the second largest bank in Wisconsin. I am

a member of the executive committee of that bank as well as being a director.

Q. Have you held any office in the Gyro Club? A. I have been president of the Gyro Club, which is an international business men's organization.

Q. Will you tell us who are the members of the board of directors of the Wisconsin Electric Power Company and when they were elected to office? A. I will give the name first and then the date on which each was elected to the board: 4028

Sylvester B. Way	May 28, 1921
Gould W. Van Derzee	June 27, 1932
Frank J. Boehm	August 31, 1937
James D. Shaw	December 19, 1927
William W. Coleman	January 25, 1926
Herbert C. Freeman	February 14, 1933
James F. Fogarty	May 31, 1921
Frederick H. Piske	August 31, 1937
Robert Sealy	December 20, 1938

Q. Now, will you tell us briefly about Mr. Way? First, you might say what position he holds. A. Mr. Way is president of Wisconsin Electric Power Company. He is a resident of the city of Milwaukee and he is 66 years old. Mr. Way's history records that he attended the grade and high schools in the state of Kansas, completing his common school education at the age of 17. He received a scholarship and entered Drexel Institute in Philadelphia in the fall of 1892. After leaving school in 1896 he entered the employment of the Electric Storage Battery Company as a draftsman. Later he 4029

4030 became an erecting engineer with the same company and one of his assignments took him to the city of St. Louis.

After completing this particular job he remained in St. Louis and entered the employment of the Imperial Electric Light, Heat and Power Company, a predecessor of the present Union Electric Company of Missouri, in the position of chief engineer or electrician.

In 1903 he advanced to the position of chief electrical engineer, which position he held until leaving that company.

4031 Mr. Way entered the service of The Milwaukee Electric Railway and Light Company, the predecessor to the present Wisconsin Electric Power Company, on November 1, 1911, as assistant general manager in charge of the electric and heating operations. On April 1, 1914 he was elected to the position of vice president and general manager and on October 23, 1925, he was elected president of the company and continued as general manager until March 1934, at which time he relinquished the position of general manager.

—1,816—

Mr. Way received his early training with the St. Louis
4032 subsidiary of the North American Company and was moved to Milwaukee by the North American Company. Mr. Way has resided in the territory served by the companies for over 28 years and has been with the company for 28 years.

There are some things that Mr. Way would not want to say if he were making this record but it can be said truthfully that Mr. Way is an outstanding utility executive in this country and that he has left a very definite mark on the utility industry. He is what you would describe as a prodigious worker. He has devoted his life to the company, really, and his intense passion for finding better and cheaper

ways to do things has really resulted in some very remarkable engineering achievements which the company and the industry have enjoyed.

I have given my own history as a director of the company and a long local resident of the community.

Next we come to Mr. Frank J. Boehm. Mr. Boehm also resides in the village of Whitefish Bay. He is now an elderly gentleman, 73 years old. Mr. Boehm entered the service of a predecessor company of the present Wisconsin Electric Power Company on February 6, 1882, as a clerk. Starting 4034 from that date his progress record reads something as follows:

On January 1, 1886 he was assistant bookkeeper. January 1, 1891, bookkeeper. February 1, 1906, he rose to the position of comptroller and auditor. On March 26, 1906, as-

sistant secretary and assistant treasurer. On March 23, 1926, secretary and treasurer, the position he now holds.

Mr. Boehm is really an unusual personality. He started in the business when they had straw in the bottom of the cars to keep your feet warm in the horse-car days. One of Mr. 4035 Boehm's early recollections of his job is waiting for horse-cars to go by the small office of the company, his job being that known as the robber of fare boxes. Mr. Boehm would see the car coming and knew that it had some money on board because of the number of trips that he had allowed it to go by without taking the money, and he would jump on the car, take the money, put it in a sack, and then take it to the bank. Those were the primitive early accounting operations of the early street car days.

4036 Q. He has resided in the territory then during this period of 58 years? A. Most of his life.

Mr. James D. Shaw is a director whose residence is Milwaukee. Mr. Shaw is 61 years old. He was graduated from the law school of the University of Wisconsin. He entered the service of the company on September 1, 1899, as an attorney and member of the law firm which was then counsel for the company. At the present time he is senior member of the law firm of Shaw, Muskat and Paulsen, which firm is
4037 general counsel for the company in Milwaukee.

—1,818—

Mr. Shaw also has a record of long residence in the local community and has been with the company 40 years. In fact, I had the personal pleasure of bestowing upon him last year at our annual meeting of the Veterans' Association, the so-called double veterans' medal for 40 years of continuous service.

Mr. William W. Coleman is a resident of Milwaukee. Mr. Coleman is president and chairman of the board of directors of Bucyrus Erie Company, which is located at South Mil-
4038 waukee, Wisconsin. Mr. Coleman has been a resident of the local community for many years and a director of this company for 14 years. He is recognized as an outstanding public spirited citizen and for many years he has been president of the Community Fund, that is the community of greater Milwaukee area.

Mr. Herbert C. Freeman is vice president of the North American Company and has been in the employ of that company in New York for approximately 14 years. He is also a director of Wisconsin Electric Power Company and has been such for seven years.

Mr. James F. Fogarty is chairman of the executive and finance committee of the North American Company. He entered the employ of the North American Company approximately 38 years ago as a junior clerk and has been a director of Wisconsin Electric Power Company for a little more than 19 years.

Frederick H. Piske is a vice president of the North American Company. He entered the employ of the North American Company approximately 30 years ago as a junior clerk and has been a director of Wisconsin Electric Power Com- 4040

—1,819—

pany for a little less than three years.

Mr. Robert Sealy, as I recollect, served in the capacity of sales manager for The Milwaukee Electric Railway and Light Company back in 1912 when I was still working for General Electric Company in Milwaukee. It happened that we had our offices in the Public Service Building and he came on for a time, sent by the North American Company to fill an existing gap as sales manager until another could be secured.

After leaving The Milwaukee Electric Railway and Light 4041 Company then Mr. Sealy entered the employment of the North American Company and is now treasurer of that company. He has been a director of the Wisconsin Electric Power Company for a little less than two years. Both Mr. Piske and Mr. Sealy, who are the directors who have been with the company the shortest period of time, have for a great many years been intimately connected with the operations of the company and I say that because I did not want to have the impression left that the short time they have been with the company has anything to do with the real knowledge

that they have of the company affairs and the same can be said with respect to all of the directors of the company, irrespective of how long they have been with the company, that they do have a very intimate knowledge of the affairs of the company.

It is interesting to note in connection with the enumeration of the directors, that five of the nine directors have been

local residents in Wisconsin for many years and are a part
4043 of the community in which they live.

Q. How often does the board of directors meet and what are its functions, Mr. Van Derzee? A. The board of directors of the Wisconsin Electric Power Company normally meets a minimum of four times a month——

Q. A month? A. A year—but the executive committee which is composed of Messrs. Way, Van Derzee, Shaw and Coleman meets generally once a week. The board of directors is in charge, naturally, of the active management of the business and directs the business in all of its phases.

4044 All of the directors, as I have stated previously, are intimately connected with the affairs of the company and its operations, and all of the directors receive at least once a month detailed reports, on the 15th or before, of the operations of the company in great detail, covering the previous month.

While the board of directors takes all the formal action such as declaration of dividends, election of officers, authorization of the issuance of securities and things like that are set up in the articles of incorporation, the board has delegated to the executive committee and has found it more con-

venient to do so, the closer supervision of the operating affairs of the company.

As stated previously the executive committee consists of

—1,821—

Messrs. Way, Van Derzee, Shaw and Coleman, all of whom reside in Milwaukee, and this committee meets weekly unless there is some reason why they can't get a quorum.

These meetings are often very extended, and at them all of the important operating conditions and problems of the company are discussed in great detail. 4046

I would like to go down through what is the normal agenda for a meeting of that kind so that you can better appreciate the intimate detail in which the executive committee functions with respect to the problems of the business.

The first thing that usually comes up at a meeting of the executive committee is a report of the cash on hand. We have a statement of the major receipts of cash, such as from electric and heating operations, merchandise, and miscellaneous sources; the disbursements of cash by their major divisions are given. 4047

In other words, if we have made a large contract on a turbine it is shown as a contract disbursement. If we have paid a dividend it will be shown as a dividend disbursement. The pay roll is set out. If we pay an important tax item that is set forth, and all the other miscellaneous disbursements are shown which are of importance.

Then after those are discussed as necessary we look at the forecast of cash which is usually with us for a period of 12 months ahead and we can determine from that and the problems which are coming up that require expenditures of

cash, if the amount of money we have on hand in sight is

—1,822—

going to meet the needs of the business.

The next item which usually follows is under the heading of "Public Service Commission matters". Under that are applications which have been made to the Public Service Commission by the company and by others for various reasons, and orders which are received from time to time from the Commission.

4049 For example, at a recent meeting a few weeks ago I recollect we discussed an order handed down by the Commission on the very complicated subject of depreciation. This order provided for the sinking fund method of depreciation with a 3½ per cent. interest addition annually to the reserve balances.

The directors of the company who are on the executive committee understand, I believe, with more than ordinary understanding, a problem as complicated as the discussion of sinking fund depreciation. It is, of course, one of our duties to determine under this heading whether or not ac-

4050 tion shall be taken on an order, that is, is it one that the company may properly accept in the interest of the business? Should it be objected to through the regular channels provided for such objections? And, in connection with this particular order that I just recited it was our conclusion that the order should be accepted, that it was a proper one for the company to follow.

Another important topic that is taken up by the executive committee and usually following in the order just given, is that of municipal matters. We, of course, receive from

—1,823—

the many municipalities in which we do business copies of the minutes of their various deliberations and undertakings. Those are scanned to see what, if any, decisions, discussions, have an important bearing on the operations of the company. They are brought to the meeting in a condensed form and discussed.

As an example of one of those discussions a number of months ago when we decided we needed to increase the capacity of the 96th Street high voltage sub-station we ran into the very uncomfortable discovery that the property 4052
had been rezoned for residential purposes. It was necessary to have the zoning changed. Our representatives who handle those matters took the subject up in the regular course of duty and at this recent meeting that I recollect we discussed the formal and final order of the county board rezoning the 96th Street sub-station so as to permit the extensive development the company was about to make at that point.

We try to keep the members of the executive committee informed on all operating matters. We have a heading in the agenda which is "Operating Matters". We don't pretend to cover everything under that heading but there are 4053
some things that are usually and normally covered every week under that heading.

The directors are very much interested in the kilowatt hour output of the company for the preceding week. They are interested in comparing that with figures which we have at the same time showing the kilowatt hour output of the

several subsidiaries of the North American Company, St. Louis, Cleveland, Washington, and the comparison of the percentage increase of our output for the past week, for the

previous year, and with the results of the other companies, affords text for a good deal of discussion as to what the reasons for departures are, what the business condition is that may have brought about changes, and what we can do, if anything, to change any trend that may be evident, not from a single week but from our knowledge of what has happened over a period of weeks.

The comparison is also made with the national output which, of course, is more of a composite figure and does not
4055 mean so much because it reflects conditions all over the country, while a comparison of these associated properties in the North American group which, with the exception of Washington, are highly industrialized like Milwaukee, gives us a very good comparative basis for discussion.

We report at these meetings under the heading of "Operating Conditions", the property additions and the property retirements of the company by each individual work order, and property retirement requisition. This is only done once a month but it is possible by this method to see just how the different operating divisions are functioning on the impor-
4056 tant subject of keeping within the budgets which the executive committee has previously gone over in great detail and which are the law of the land as far as the operating depart-

ments are concerned on the question of allowable expenditure.

When special projects come up and they do, if we don't have enough, as we see it, in the operating budget over-all allowance made at the beginning of the year, then it is necessary for the executive committee to make a special appropria-

tion. The work cannot proceed without such an appropriation.

We discuss many other matters under this heading regularly. They include such things as power plant efficiency. We have what we believe are some very excellent power plants that I would like to discuss more in detail a little later. We regularly have once a month the kilowatt hours used by 30 large industrial customers who have been on the system for a good many years and whose changing use of kilowatt hours we think is a rather good index of industrial 4058
operations, so we see what is happening to that curve.

It might be interesting for you to know that that curve has been in operation for a period preceding 1929 and in June 1929 that curve took a decided slump but in the presence of all the history that had gone before we did not realize the importance of that particular curve and the slump which it took in that month. History has shown that that was the month in which business actually began the slump before the severe depression that started publicly in October of that year.

4059

We also have before us the results of impressions and conclusions of a number of economists and business analysts.

—1,826—

We take these for what we think they are worth and it is good to get all kinds of opinions, particularly at this time, on the business situation. We also are interested in watching the ups and downs and predictions with respect to the Federal Reserve Board index of industrial production. We have to attempt to predict that a year ahead in making up our budgets because the largest single unit of electric service

sales is in the field of industrial power and that has some relation to the business situation.

I will not attempt to enumerate all of the other things that are handled under the heading of "Operating Matters", but rather go to one of the very important subjects that we discussed at each meeting, relating to sales promotion. Under this heading the accomplishments of the sales department are discussed. The meeting is not devoted entirely to a discussion of accomplishments except insofar as a study
4061 of history is a good index of what we ought to do in the future, but we do discuss and look at the most recent history of the operations of the sales department we can get.

We have up to the period of the month ending the night before the meeting at each of these meetings of the executive committee, a statement of the number of electric ranges which have been sold for the month and the year to date, compared with the corresponding periods of the preceding year. —1,827—

We have a similar statement of the number of water heaters, electrically operated naturally, that are similarly
4062 sold. The number of better-sight lamps, the number of roasters, which are a very important item in creating a desire to cook electrically. We also have a record of the amount in dollars of the incandescent lamp bulbs that are sold because that is some index of how well the boys are doing in getting new bulbs into homes.

Some of these figures are for the industry as a whole insofar as we can get it, for these sales, and that includes electric water heaters and electric ranges, but the other comparative sales which include refrigerators are just the sales of our own sales department.

In that connection I would like to emphasize that we place stress on the selling of things that the average merchant is unable to proceed with as enthusiastically as we would like to see him. That is because in some of these things there is a tremendous sales development expense. That has been going on in the promotion of electric water heaters. They have not as yet reached the complete stage of acceptance, say, that an electric refrigerator has, and it is true of other things.

An example which may never be a practical device is an 4064
electric garbage burner. You don't hear about electric garbage burners. There are good reasons why you don't hear about them. They can be made. They are very expensive. They can't be sold in quantity. A dealer just will not put them on the shelf. A dealer will put the things on the shelf

—1,828—

when the time comes that they have national acceptance and they are easy to sell without necessarily having high sales expense by a salesman calling door to door, and when he can expect to have the public come in and take such devices off
the shelf. 4065

We discuss at these meetings of the executive committee, the new sales developments and we give our advice to the vice president in charge of sales. If he has a project that we don't think is particularly good, and yet about which he is particularly enthusiastic, he may be invited into the executive committee to give his own views on the subject. We try to keep our head officers and others informed on the supervision that the executive committee gives locally to the operations of this company, not only so that they will know what is going on, but because the knowledge that their problems

are intimately looked at week by week by the head officers of the company, is an encouraging thing, and there isn't a single thing that the company does that really requires more encouragement and the injection of more enthusiasm than the business of selling. It is a study of psychology. You can put the damper on sales efforts by a word or a gesture. I did not mean to say that sales people are opera singers but they do have some of the tendencies and they need to be treated in a very definite way and with an understanding of
4067 what their problems are.

To do that you have to do it from door to door. As an

example of some of the things that the executive committee approves, we had at a recent meeting a recommendation by the sales manager that the company cooperate rather extensively with a Milwaukee newspaper called the Milwaukee Sentinel, in a Feminine Fair to be held at the Milwaukee auditorium which seats some 15,000 people, in connection with which, if we so desired to cooperate, they would have among other things to attract the women of the community,
4068 an all-electric cooking exhibit, and they would go so far as to build and give away as a prize to the lucky one who drew the number, this $8,000 all-electric home.

We were asked to cooperate with the Wisconsin Chapter of Architects which was called upon by the Milwaukee Sentinel to build this home and make it an all-electric home. We had some other plans for the year end leading up to the Christmas period when we try to get as many people as possible to buy electrical gifts for Christmas, but this sounded so good to us that we decided to shift an item of several thousand dollars that we had for a year-end contest

to cooperating with the Milwaukee Sentinel in carrying on the project of the Feminine Fair with its attendant gift of an all-electric home.

(Discussion off the record.)

Q. Now, you have another item on the agenda entitled "Miscellaneous Matters"? A. Yes. Under that heading we bring to the attention of the committee information on any activity which has occurred during the past week and which

—1,830— 4070

is normally not handled under some other heading.

We also regularly have a discussion of coal. We give the amount of coal on hand, the amount received and disbursed. When coal contracts are up to be signed, the price details, where the coal is coming from, are all brought before the executive committee before the officers execute contracts.

We naturally have the very important subdivision known as the "Labor Situation". This does not mean that there is necessarily anything requiring particular attention on the subject of labor but we do think it is a good thing to have the executive committee see the number of people who are 4071 entering the services of the company each week, the number that are leaving, and to have them divided by important groups, that is how many came into the accounting department, how many left the accounting department, how many came into the electric distribution department and how many left.

Just recently there was a rather large increase in the electric distribution department. Immediately the committee wanted to know why that occurred and it was due to the employment of a substantial number of needy students

4072 who were good, big and husky and wanted to work during the summer, and were just the men that we like to have go out and dig ditches.

The only real complaint I have ever heard in connection with employing these students—I think we had over 50 during the summer—was that they have the objective of in-

—1,831—

creasing the size of their muscles and that isn't definitely known to be a characteristic of the average workman doing
4073 the same work and the trouble is they set too fast a pace, but that was the explanation and similarily in other cases explanations are given why there are departures in any considerable magnitude in the number of people on the pay roll.

I will tell you at a different time my own personal observation of the detail which is back of these records that are presented to the executive committee, where we get into each individual person who changes his status in any way, in which examination we see the individual, not personally but through the report that is presented, as to why he is leaving, why his status is changing in any way.

4074 In exceptional cases where the officers think that they need the advice of the executive committee some of them are taken to the executive committee for counsel and advice.

In addition to the foregoing matters there are a number of important subjects which come before the committee at irregular intervals. Among these is the determination of the necessity of installing additional power plants. Just recently that subject came home with a bang. We had set aside cash to finish the Commerce Street power plant extension which you have heard about and we thought that no

new power plant extensions would be required, even to be thought about, at least until sometime in 1941, but the

—1,832—

advent of the war and the effect on the preparedness program of this country made it essential to give consideration to our meeting without question the known and even the doubtful needs of industry for power in order to carry on preparedness.

We had a discussion down at the New York office, along with the other officers of several North American companies—— 4076

Q. North American subsidiaries? A. —subsidiaries, in which each one put his cards on the table about the power problems that he had. We got considerable information on the various views as to how much additional power would be required for preparedness purposes, and it was quite interesting to note that except in cases where there were explainable differences the amount of power estimated to be required for preparedness purposes was fairly close together in several subsidiaries of the North American 4077 Company which are in industrial centers.

We came away from that meeting after getting the intimate views of what was likely to happen in the preparedness field, with a very definite feeling that we ought to reconsider our previous intentions not to install any more power plant capacity in the immediate future.

That culminated in a very careful study covering the installation of an 80,000 kilowatt unit known as Port Washington No. 2, at Port Washington, Wisconsin.

—1,833—

When I say, as I did, that there are a number of rather important and irregularly occurring subjects before the executive committee, I mention this as one of the very important ones of that type.

We also have at least once a year another extremely important operation which is supervised by the executive committee, and that is passing on the sum total and also in general the details of the construction budgets and the operating budgets of the company.

4079 There is prepared by each department that does construction work or has occasion to make any kind of expenditures, a budget showing by each individual item of construction the name of it, the amount that it is expected to cost, and in an accompanying outline the particular reason why the department head thinks that that is a necessary piece of construction to be put in during the coming year.

That is, shortly we will begin preparation of the construction budget for the entire year of 1941. As a matter of fact the underlying divisions and departments are working on it now, but we will have it ready sometime in November. We,
4080 of course, know further ahead than that just what we ought to do about the large and important expenditures for power plants which I have previously described to you.

The executive committee reviews, not in great detail, each underlying individual item, but it does rely on the judgment of the general executive officers whose functions and names I

will describe to you later, as to the necessity for these individual expenditures. It is, however, very deeply concerned with the total amount of money to be spent as covered by the budget and with the means of getting that money

for such expense, and if no immediate efficient method of getting the needed amount appears to the executive committee, the budget is sent back with instructions that some substitute method that might defer without endangering the service, the different construction items, be found.

That just very briefly indicates what the executive committee does on the construction budget. It does not mean that the departments are thereupon authorized to spend, without further supervision, the money required to do all this construction work, and there may be occasion a little later to 4082 go into that in connection with what are the duties of these general executive officers which were mentioned.

We go through somewhat the same general supervisory review of what we call the operating budget. Probably there is no document that is prepared by our company that requires such detailed research, such prediction in advance, of every single movement and operation that costs money, that this one does. Our detailed operating budget is made up by all of the individual primary, secondary, and every other account that appears on the books. In other words, if Account 145 is the number which is used on the charge account for 4083 premises expenses, then someone familiar with the nature

—1,835—

of the charges that go to that account, with the possibility of improvement in the account, by reducing it, of course, figures out approximately the budget for that account for the coming year.

There are literally thousands of those accounts. They are reviewed first by the department heads after the men as far down the line as possible give their ideas on what the necessary expenditures for good service should be. Those budgets

are then passed to the vice president in charge of the particular department. They then come to the general manager as one of the general executive officers and in this process there may be a great many changes made.

When they finally come to the executive committee they are supposed to be formed, and are formed so as to represent approximately the revenues we expect to collect and the disposition of those revenues by classes of services, by functions of the business, such as electric and heating.

4085 The executive committee then approves the final operating budget and it may not be changed without the approval of the executive committee.

I think that those are fair examples of the irregularly occurring important items that come before the executive committee. Now, it might be said that in general the executive committee is in constant and, I think, most intimate touch with the affairs of this business. They are in touch with all of the important decisions of management and have

—1,836—

really approved all of them except those that are naturally
4086 left with the officers of the company in their discretion, but the discretion even is handed down. The officers understand the limits in which that discretion may operate.

The minutes of the executive committee, I know from experience because I have been the secretary, are usually dictated within the hour after the meeting has finished, and are distributed promptly, usually the next day, to all of the directors of the company.

The distribution of these minutes to the members of the board of directors naturally does not constitute ratification of those minutes, but they know what is going on in advance.

The five local directors in Milwaukee, including the four who constitute the executive committee, naturally have the very close view of the property. From the minutes that are made available to the other four directors they can ascertain and do ascertain what is going on. Ratification, if they are approved by the board of directors, occurs at one of the meetings which I referred to as occurring a minimum of four times a year.

I think in substance, and in conclusion on this important topic of what the executive committee really does, we can say 4088 that it does everything that a small board of directors, all of whom are very close to the business, most of whom work in it, could possibly do for the interests of the customers and others who put their money in the business.

—1,837—

Q. In substance, you would say that the executive committee is in active charge of the management of the company? A. That is true.

Mr. Browning: This is a good time to interrupt.

The Examiner: All right. We will recess until two o'clock this afternoon. 4089

(Whereupon, at 12:35 o'clock the hearing recessed, to reconvene at 2:00 p. m.)

4090 *Gould W. Van Derzee—By Respondents—Direct*

AFTERNOON SESSION

(Whereupon, at 2:00 o'clock p. m. the hearing reconvened.)

The Examiner: You may proceed.

Whereupon GOULD W. VAN DERZEE resumed the stand and testified further as follows:

4091 *Direct Examination by Mr. Browning (Continued):*

Q. Who are the general executive officers of Wisconsin Electric Power Company? A. The two general executive officers—that is, the officers whose duties extend over all the activities of the company are the president, Mr. Way, and the vice president and general manager, Mr. Van Derzee.

They exercise general supervision over all of the other officers of the business and over all phases of the business subject to the control of the Board of Directors and the Executive Committee.

4092 They have a great many things to do, naturally, that executive officers are supposed to do. Naturally, someone has to bring reports and ideas and suggestions to the Executive Committee and it is generally up to the general executive officers just enumerated to bring to the Executive Committee information under all of the topics of the agenda which I previously described at some length.

—1,839—

In addition to that, these officers have to carry out the orders that are given the general executive officers by the Executive Committee.

They have to execute them in the field and in connection with such execution and with the other problems that confront the general executive officers they have a number of problems, a few of which I will relate.

It is advisable in any corporation to have a ready means of getting together all of the officers and department heads at stated intervals in order to discuss with them policies of the company that have been laid down by the Executive Committee and as important to get from the men more or less down the line the ideas that they have on how to run 4094
the business.

No one group of general executive officers or on the Executive Committee can hope to run a business successfully without that kind of consideration and cooperation with the men as far down the line as possible.

We have what is called a management staff meeting. The management staff has a membership consisting of the general executive officers, all the other officers of the company, all of the department heads of the company.

As I recollect it, a full meeting of that staff, which is held in the Board Room of the company around a long table, 4095
consists of about twenty-two to twenty-four persons.

In order to take up as little time as possible away from

active work, we meet at 12:30 on the second and the last Wednesdays of each month. A sandwich and a piece of pie are served so that we don't have to go out to dinner.

About 1:00 o'clock the meeting of the business begins. I think it is well to picture the position of the general executive officers as in between the Executive Committee on one hand, which is above them, and the managements' staff, with

which they meet at intervals which is, so to speak, below them, in corporate relationships only, and the flow of authority down from the Executive Committee through the general officers to the members of the staff.

There are, naturally, many meetings with the individual members of the managements' staff daily, but these meetings of which I speak are policy meetings, designed to get everybody uniformly behind an idea and to dig up ideas from the group that the general executive officers may wish to put
4097 into practice.

Several days before a meeting of the managements' staff is scheduled, a notice is sent out by a secretary of this meeting to all the members of the staff, asking them to contribute articles of information, detail matters that they wish to have brought up at the meeting, and otherwise express themselves in writing so as to facilitate an orderly discussion of what is to come before the meeting.

The secretary takes this information, puts it together in

what are called news notes. Ordinarily, you might call them
4098 agenda except they aren't compiled like an agenda is compiled. They are a collection of ideas such as I have described.

I want to tell you just a little bit about a sample meeting because I think it is important that you know how this local group of officers and department heads really functions, the things they talk about.

You can judge something of the earnestness of those who are carrying on the business by not only the things they do, but the things they talk about.

One of the first things that usually appears in the news notes relates to employment matters. To be specific, in the

news notes of August 14, we find such things as these enumerated, and this was prepared by the men who have charge of the employment activities.

The news notes show that monthly survey conducted by the public employment office indicates 42,000 persons employed as of August 1 this year, compared with 41,000—I am giving round figures—last year.

Now, that is of information to us for the specific group this employment covers, because it indicates the ups and 4100
downs of industry.

Q. Employed by whom, Mr. Van Derzee? A. I think I mentioned that.

(Discussion off the record.)

—1,842—

A. I mentioned that this referred to the specific group but I did not state that it was a group of forty or more manufacturers who contributed information monthly to the general employment office.

We have detail which shows the particular industries in which there are increases and those in which there are de- 4101
creases. Those things have some significance to people around the table. We report the number of new registrations for unemployment benefit claims to indicate the status of employment in the district, and then we have our own employment record which shows the number of employees entering the company by departments for the month, the number who left.

Department heads are called upon to describe the reasons for unusual departures from normal employment in any de-

4102 partment and I think this morning I mentioned the employment of a number of students.

It so happens that in these news notes which I am describing of August 14, this particular department, the electric distribution department, had forty-two placements, of which thirty-eight are temporary, and those were the students that I was talking about this morning.

There is only one left. The reasons for terminations, discharges, if any, are given, and they are usually discussed.

4103 We then have a record of the employees entering and leaving the services of The Milwaukee Electric Railway and Transport Company and I didn't say before but should have

said that this managements' staff meeting is a meeting of all of the officers and department heads of both Wisconsin Electric Power Company and The Milwaukee Electric Railway and Transport Company.

Q. Does it include department heads of any other company? A. It doesn't regularly include department heads of other companies primarily because of the distance, but we

4104 have other inter-company meetings from time to time which take the place of those.

The operations of these two companies are extremely intimately involved and when the separation was made from a corporate standpoint in October, 1938, whereby the transportation activities are transferred to so-called Transport Company, we kept right on with the same meetings of all the people that were formerly the department heads and officers of the one company—that is, it is operated about the same as before, but has two names.

I don't mean to say that there has been no change in the corporate offices—there have—but the fundamental principles that guide the company in operation are still the fundamental principles of operation for each company.

We have under this heading of employment also a record of employees that are transferred. If, for some reason, an employee must leave one of the company's departments, we try, through our central employment department which operates for both companies, to find a job for him in some other

branch of our business.

If they have been trained in the business which we usually try to keep them in, it is foolish not to try to find a place for them elsewhere because they are better employees, as a rule, than getting someone on the outside who knows nothing about the business, so we pay particular attention to transferring employees from one department to another in preference to lay-offs and discharges.

We next come to something that is reported in each of these meetings—that is, the kilowatt hour output of Wisconsin-Michigan group of properties, and for Wisconsin 4107
Electric Power Company, alone.

For example, for the two weeks ending August 3, 1940, the output of the system of Wisconsin Electric Power Company, alone, including the sales of dump steam power, which are very necessary for Wisconsin Michigan Power Company, were up 9 per cent., whereas, the corresponding figure for the entire system was 12½ per cent.

Q. By the entire system you mean to include Wisconsin Michigan Power Company and Wisconsin Gas & Electric

Company? A. That is right. Over what we call the service area.

Q. All right. A. Here appears in the news notes, probably contributed by the electric distribution department, the statement that the third from the last customer to use 25-cycle

—1,845—

service on the system was practically changed over to 60-cycle service leaving just two customers still taking 25-cycle service.

4109 Years ago we had 25-cycle service over a wide area. This third from the last customer happened to be the Cutler-Hammer Manufacturing Company.

The only customers that are now left, effective after this change, are service to the Chicago, North Shore & Milwaukee Railroad which operates an interurban line between Chicago and Milwaukee, and the Stratton Grain Elevator.

Inasmuch as we have a frequency changer at the First Street Sub-station, which can be used in the reverse from the old direction—that is, it can be used to generate 25-cycle service, running off the 60-cycle end, we do not have to run

4110 25-cycle generators at the Commerce Street Power Plant for this purpose except in cases of emergency.

Now, we come to that phase of the managements' staff meeting where a report from the purchasing agent comes up and the purchasing agent reports on the iron and steel market, the copper market, the gasoline market, the scrap market, and any other market that anyone is interested in, that the company may be particularly interested in.

Just about this time we had quite a spirited discussion on whether it was the time to sell several thousand tons of old steel rails which Wisconsin Electric Power Company had

accumulated incident to abandonment of interurban railway

—1,846—

operations, where it owned the rails and leased them to the Transport Company.

There is also a substantial amount of scrap of this type that accumulates from the operations of the Transport Company of its own rail facilities. We have to take out special work and replace it, take up sections of rails and replace them, so we always have considerable scrap on hand.

We get the advice of those who are presumed to know. 4112
We know the trend of the market generally. While we haven't sold this steel scrap, I am inclined that we won't keep it too long. Too many opportunities are lost trying to get the last nickel.

From Mr. Dornbrook, whose first name is Fred, we have a report on the Commerce Street new installation which gives a lot of things that probably aren't interesting to outsiders, but to the staff, it is interesting to know that 40 per cent. of the high-pressure piping from the boiler to the turbine is in, 25 per cent. of the feed water piping is installed, that air compressors are grouted in, and equipment for the new black- 4113
smith shop is installed.

We have to have facilities adjacent to these modern power plants to take care of breakdowns and give prompt service to our customers and are putting in modern equipment for that purpose in connection with the large installation at Commerce Street consisting of a 35,000 kilowatt extraction turbine.

—1,847—

Here follows Mr. Dornbrook's discussion of the East Wells Street high-pressure plant and he brings to our atten-

4114

tion certain trouble that he has had taking down the rotor of the 13,700 kilowatt machine. How soon he expects to get it back in, those things are of interest not only to the management, but they are of interest to the sales department in knowing that the steam heating system will start efficiently at a certain time, that adequate capacity will be available, particularly in these times when we have a 30,000 kilowatt machine out of service at the Lakeside Plant due to a burned out rotor, and we are also having the annual or semi-annual

4115

overhauling of the Port Washington plant which means that another 80,000 kilowatt unit is out. So it becomes important to have everybody know the status of all of the operating machines.

We discuss the coal stock. Whereas the average householder deals in five, ten or twenty tons of coal, we have to deal in great quantities of coal, running up into hundreds of thousands of tons, and this particular discussion of the coal stock this week related to how many tons of coal we had had delivered on our contracts that we expected to get in before the price increase took effect under the government control.

4116

Now, comes Mr. Coffin, with a discussion of sales matters in which everyone is interested. He talks about the thirty large industrial customers that I mentioned to you this morning and what he sees in the information on that group.

—1,848—

He indicates that eight large steel foundries show a material increase over the preceding week and wonders if that is the start of a little boom in Milwaukee, because foundries are known to start up first.

Milwaukee is one of the great electric steel centers of this country, and that is true because when there weren't any

adequate usable steel furnaces, our company built some of the first ones, and by cooperative measures got the foundries to use electricity for the melting of steel and the effect of that is now shown in the large sales of kilowatt hours through this source.

I want to elaborate on that a little later when we talk about a certain affiliate that we have, known as the Hevi-Duty Electric Company which picked up that job and started the desig.. and building of other types of current-consuming devices, electric furnaces primarily, that we couldn't get 4118
large manufacturers to build and guarantee at the time we went into that business.

Sometimes, in these new notes, we talk about individual companies and when a large company like the A. O. Smith Company, which is one of our largest customers, shuts down for a day or two for inventory, that is a couple of days loss of a lot of kilowatt hours and the sales manager is probably reporting that so we will know, if we see a little dent, what that is.

He puts in also information about the fact that some of
—1,849— 4119
our customers have received orders. He has heard that the A. O. Smith Company has received a large order for pipe. That is prospective business being put away in our mind to sell kilowatt hours for.

Just as an interesting sidelight, and I know I am rambling a good deal on this to give you a broad picture of the business, this little Hevi-Duty Electric Company built the world's largest electric furnace at the request of the A. O. Smith Corporation with a capacity of 6,000 kilowatts on one connection of the windings and 12,000 on another.

4120 That one furnace at that time, when operating regularly, twenty-four hours a day, was capable of using as many kilowatt hours as all of the residence customers in the City of Milwaukee.

There is a report here that anticipating increased business, Milwaukee foundries were contemplating increasing their plants and since then we have found out that Milwaukee will probably receive quite a substantial amount of preparedness business that will require considerable elec-
4121 tricity, and that our foresight, if you can call it that, in deciding to put in Port Washington No. 2 prior to the time that we could see actually the complete method of financing, probably was justified.

Then follows descriptions by Mr. Coffin, our sales manager, of various new jobs of electric power installations, and he concludes by giving a comparison to the staff of the record of sales appliances from January 1 to the end of the previous month.

—1,850—

Just a few of them may be of interest to indicate that we
4122 are somewhat ahead of last year in some important items. Electric ranges, 1,732 compared with 1,523 last year. The quota on electric ranges for the year is 3,500 and we expect to meet it because we sell more of them at the end of the year than in the summer.

Electric water heaters, 799 compared with 568. Our quota is 1,500. We may have difficulty in meeting that. We are putting on extra pressure.

Refrigerators—that is, sales just off of our own floor and we don't attempt to do but a very small part of the business —955 compared with 785.

4123

Roasters and casseroles, 1,209 compared with 718. The roaster, as I think was intimated this morning, is one of the devices which introduces electric cooking to the home. It is an extremely interesting device to almost any woman that has tried it and I believe that in the City of Milwaukee, somewhere between, I would say, a third and a half of the customers have them, if not more.

(Discussion off the record.)

4124

A. Better sight lamps, 2,198 compared with 2,112. That shows a decrease in the company's sales of better sight lamps. The reason is that we don't have to put the emphasis on those things because they are off-the-shelf articles. You can buy them in hundreds of outlets and we much prefer to have other people do our selling for us on things that they push.

—1,851—

Now, from the head of the plant engineering department, we have a report on the work he is doing underpinning the foundations of the Public Service Building, installing some new equipment in Ann's Electric Grill in our building, work on installation of air-conditioning systems of which we are putting in two in the building this year, and reports on his part of the building construction work as distinguished from the machinery at the Commerce Street Power Plant and at the other points on the system.

4125

He reports that the steel structure for the 28th Street Sub-station is up, and the progress on the 96th Street Sub-station, that the new bus storage building addition at the Fiebrantz Avenue car station in progressing in accordance with the schedule. There is a case where Mr. Luber, who has

this plant engineering department, does building drafting for the building requirements of the Transport Company and makes it unnecessary to have the duplicate organization that might otherwise be required.

He reports on the Lisbon Avenue Sub-station, a small sub-station out near the limits of Milwaukee County where the load has grown so rapidly that we have to put in additional feeders and that requires additional buildings.

4127 Here is a report from the department head of the Transport Company, Mr. Archambault. Mr. Archambault is engineer of Way and Structures and he has charge of installa-

tion of tracks, road-beds. Maintenance and construction of the signal system is under his direction, and all of this track that is being removed on the abandonment of railway operations is taken care of and disposed of as scrap.

He reports on various work he is doing and most important of the items is probably the installation of the duplicate overhead trolley required for trolley buses. That is

4128 a Transport Company operation. They buy the new trolley buses; they construct the overhead trolley as well as constructing, operating and maintaining the regular street car operation.

We haven't said a great deal about trolley buses. I think we have a place to say that a little later. It is a very interesting modern development of transportation in metropolitan centers.

Mr. Archambault of the Transport Company reports that he is just constructing a turn-out and track facility necessary in the disposal of ashes at the electric company's Lake-

side Power plant. Not being in the business of putting down tracks, obviously we go to the best place to have that work done and that is our affiliate transport company.

Then follows a discussion of the abandonment of the Oconomowoc-Watertown line. That is a stretch of about eleven miles of track that the Public Service Commission has permitted us to abandon on showing that it could not be maintained economically and in the public interest.

—1,853—

4130

Our assistant treasurer and controller, Mr. Bohl, reports on passenger revenues by various divisions of the system, electric service revenues, the combined increase in electric service and passenger revenues which is a hangover from the time that we had the one company, but it is still just as interesting to us as if the companies were together as of old, because the Transport Company is a direct subsidiary and, finally, these particular news notes which are not as complete as some, wind up with a discussion of two or three large delinquent service accounts.

Usually that brings up various questions of why they are 4131
delinquent, what the chances of getting the money are, extent of the pressure that we ought to put upon the collection of such accounts with due regard for the interests of our company and possible continuance or non-continuance of the delinquent.

And so these meetings go. Next time, probably, quite a different set of things will come before the general executive officers and the staff and these minutes do not pretend to record everything that occurs, but we get a great deal of advantage out of these meetings and carry many things

4132

from these meetings to the Executive Committee and actually carry out many things that we don't have to go to the Executive Committee for permission to carry out.

When I say, "we," I mean the general executive officers

—1,854—

who get the great benefit from these meetings.

All of that discussion was around the subject of the management of staff meetings. I was in the process of telling you just what officers of the company do—that is, the gen-

4133 eral executive officers.

It seems to me that I have covered a great many things because it is the general executive officers that have to bring this wide range of subjects before the Executive Committee and in merely reciting the things that come up in the management staff meeting you have got some picture of the things that are of interest to the general executive officers and indicate, incidentally, some of their duties in connection therewith. But we have some other duties and I will endeavor to go through those without too great detail.

4134 We have many relations with municipalities and regulatory commissions which have been discussed somewhat before. We have to take the original action on these things. We have to decide just what we are going to do about answering an extensive rate complaint if we have one.

It is up to the general executive officers to receive all of these applications to commissions that are prepared by others in the company, approve the final form of them and sign them. When the orders come in, they come to the general executive officers as a rule, at least finally, and we have

to initiate placing those in effect where the initiation involves matters of company policy.

—1,855—

It was up to the general executive officers in January, 1938, when the new classification of accounts was adopted by the Public Service Commission, to decide what the company was going to do about the matter of depreciation.

The orders that came out, as I recollect it, said that straight-line depreciation would be the order of the day unless within thirty days the company presents to the Com- 4136
mission a statement of the type and method of depreciation that it considers the best for its own operations.

We had to conclude, as we did in our case, that sinking fund depreciation with a 3½ per cent. interest charge on reserve balances was the proper thing in order to have continuity in the form of depreciation methods which had been employed for many years and by order of the Public Service Commission of Wisconsin.

That proceeding involved hearings before the Public Service Commission, many informal conferences, preparation of very substantial amounts of information for the Commis- 4137
sion, before the Commission was willing to issue the order, which finally came down and which I referred to this morning.

The general executive officers are responsible for initiating, with the assistance of power plant advisors, plans for installing additional capacity and it is their views on these matters that are brought before the Executive Committee in the particular instance which resulted in the approval

—1,856—

of the Executive Committee for Port Washington No. 2.

We are confronted from time to time with determining matters of policy with respect to rules that are initiated by the Public Service Commission and these matters are usually handled by people under the direction of the general executive officers who are familiar with matters of that kind.

In considering our relations with municipalities, we have many types of contacts that necessitate action by the general executive officers. These relate to decisions of the Executive Committee on matters which are brought before them under
4139 the heading of "Municipal Matters" at the executive meetings, and many other actions that do not come before them, included among which are decisions on changing types of street lighting in a municipality, removal of poles at the request of the community, either because they want the poles off the streets or in the alleys or underground or because they are paving or for some other reason.

Also there are questions of zoning which come before the general executive officers which arise in connection with municipal matters. The general executive officers have their hands full on policy matters relating to taxes. There are
4140 just about as many problems that come up on the tax situation as you can think of.

Our largest problem is when the State sends us a little

note sometime late in the spring, that we have had a temporary assessment of very many millions of dollars on our property, or that the general state rate has gone up so much, that the tax bill will be of the order of several million dollars. It is up to the general executive officers to arrange for proper representation and the policy which will guide

our representation in the hearing before the State Tax Department on the amount of the assessment.

There are many problems that call for a decision of general executive officers in connection with Federal Income Taxes and State Income Taxes. Sometimes these are matters which involve a decision on "shall we pay several hundred thousand dollars in the settlement of back taxes or shall we proceed for review before higher authority."

They are matters that require insight into the business, judgment. We get all the advice we can on these matters. 4142
The other officers of the company are expert in tax matters. We call on them. But in telling about the general executive officers, I am doing this—I want to say reluctantly—because everyone recognizes that the general executive officers don't do everything.

We have many other officers whose duties will be described later. I want you to know that we give all due credit to the very fine staff that we have, and that this is just section 1 of the description of what officers do.

—1,858—

4143

In addition to ad valorem and Federal Income and State Income Taxes, we have some dozen other taxes on various operations of the company, without the horde of indirect taxes on which occasional matters of policy arise.

I have mentioned just indirectly the question of labor and have a good many problems of general executive officers that relate to the matter of labor. These officers review all of the contracts which are the results of preliminary negotiations by our labor representatives and those of the unions, and really have to finally pass on whether the company is willing

to do certain things and can do them, or whether it is better to take some other course.

I don't mean by "some other course," one that leads to discontinuance of service, but some other review of the situation. It so happens that the general manager of the company is named in the labor agreements as the "Court of Last Appeal" on grievances prior to arbitration.

It is quite natural, then, that we should look at these major items of policy very carefully in the light of our ex-
4145 perience, what is fair to the men, and that we shouldn't be precipitous.

I would rather discuss the matter of labor relations a little more fully under the next subject which, is what the general executive officers have to do with employee relations. I think that it can be said very definitely that not only the general executive officers, but all the other officers of the

—1,859—

company appreciate the great importance that proper relationship plays between the company and its employees, and that these relationships be maintained at the very highest
4146 possible level.

Poor employee relationships mean internal discord and can very rapidly reflect in poor public relations. We endeavor, through the medium of the management's staff, to instill into officers and department heads at least what we see about the importance of employee relations and the proper dealing with labor.

We can not overemphasize how important we think that is. Probably all of this heads up in the general subject of Wages and Hours, working conditions, vacation and sick

leave, extra compensation for additional effort, proper recognition of men personally who do a good job as distinguished from just giving them a little raise, and our consideration of these problems has caused us to think about two very important things.

One of these is job specifications, the other is employee rating. We are endeavoring to find the very best way of rating an employee. We would like to know what all his capabilities are.

We have, of course, a rather complete history of each one, 4148
but we wish to go further and to keep an unobjectionable record of the important, good things that the employee does and also a record of the various things in which he is not so proficient.

—1,860—

It is possible to find a job for almost any type of intellect, if you know just what that person is capable of doing. Our thinking, so far, has developed a rather temporary form of report which is designed to include all of the important things that I have mentioned.

It is also designed to provide a review at least once a year 4149
of everybody in the company by his immediate supervisor and by the department head, and we think that before any final records or notations are put away on John Smith's card, that this should be done with the full approval of the department head working with the man who has worked with John, so that either because of favoritism or bias, the department head will act as a brake on any entries that might in any way react to the disadvantage of John Smith in the years to come when his immediate supervisor or even the department head is not there to review it.

4150 Now, we expect to develop a record on these cards as time goes along which may read something like this:

"John is pretty good in this job, but he seems to have a natural inclination for detail work in the record department;" or "John seems to be wonderful material for some executive position some day;" or any one of a number of different statements of that type.

It may be a long time before we can get him a position in the record department or he may become an executive, but if
4151 we can get the composite judgment of all the people that

worked with him down through the years and then an executive position opens up by the death of some one, that has to be filled promptly, we don't get a situation where somebody sits down and says, "This fellow ought to be all right to fill that job, I have known him a long time"; somebody else says, "No, he won't do at all; he hasn't the right color hair for that job."

What we want is to be able to turn to these cards and find that experience has said that when an executive posi-
4152 tion for John Smith opens up, John is the man and we don't have to waste any time because we know the judgment is good. That is just an example of what we have been working on for a year or so in trying to get this system going.

It is a long way from perfect, but it is one of the very important things, I think, in employee relations. I think, if a man way down in a menial position—not menial because of the character of the work, but because of, say, the very low pay that he has—thinks that once a year somebody takes a look at him and puts down on a card what they

think of him, and he has confidence that what is on that card is a fair mirror of himself, he is going to be a lot better employee. He is going to think he has a place some day higher up in the company.

I know I would feel that way if I were the employee.

Then we come to the second thing that we want to do that I think has a great bearing on employee relations, and that is job specifications, and we have gone a good deal

—1,862—

further with that than we have with the other matter. 4154

What does an employee do? I doubt if any department head could sit down and tell exactly what every one of his employees does, and when you put the problem up to the employee, he sometimes is put to it to tell you everything that he does, and it is not peculiar to those employees.

It is right here with the general executive officer as you may have observed in my difficulties in telling you what I do. But in this matter of job specifications, we have a committee consisting of rather disinterested people representative of the educational department, another representative of the research department, a representative of the de- 4155
partment in which the man to be rated comes from.

The first thing that is done in the case of John Doe who wants to be rated, is that he is given a form to fill out in his own words, exactly everything that he does, and then presumably everything is down that he does do, but we find that it is necessary to add our own knowledge of what he does because he is not always complete in his own specifications.

The process of job specifications from that point on is to evaluate all of the different components of this particular

4156

job and perhaps I shouldn't get John Doe too closely related to the job specification because it is carried out more or less independently of John Doe as far as the job specification is concerned.

—1,863—

It is when we want to rate the man who thinks he is working under that specification that we have him put down his individual characteristics, and it is from his statements of what he thinks he does and what the department head says
4157 are the characteristics of the job, that we then proceed to evaluate these various operations and there are a great number of them.

They go over the full field of manual work, psychological requirements, sales ability, tact—forty or more of those different characteristics—and we say, "If this man has a job that requires considerable perception and quickness, that that is rated at so much; if it requires certain dexterity and agility of fingers, that is a matter that is rated in so many points; if he has to meet customers, and it is hard to get
4158 people to do this particular job, the ability to satisfactorily meet customers is given a certain rating," and so on down until we have rated and appraised each of the different items.

The problem is to apply a value to the accumulated points that we have given to him so as to get a salary in dollars and cents, and this rating per point has been determined by breaking down a known job which is relatively easy to analyze, and where we know that the pay is right up to market, and determining from that what the value is of similar points in the specifications for a different job.

—1,864—

4159

Well, without trying to give you all the details, I can say that one of our unions—we have four of them—thought this was so good that they stole the idea with our full permission and wrote an article on it in their monthly magazine, of how they were going to answer complaints about people who think they are not rated correctly in the future, and we have done quite a little work along those lines.

I believe that it will take a lot of guessing out of the determination of the proper salaries for certain work. It should have a very profound effect on the satisfaction of the 4160
employee with his final rating.

After all, the employee doesn't have to stay where he is rated, he can pull himself up by his own efforts, and our philosophy is that it is not the proper thing to do to raise wages generally so as to cover the complaint of a dissatisfied minority, because the increase extends over the whole company.

It is better to try to reason with those men, that for the work they are doing, they are getting a proper wage scale, and that it lies within themselves to study, to look for opportunities and to get better pay by qualifying themselves to 4161
get that pay.

The general executive officers have something to do with public relations. Public relations are probably everybody's job. Not to spend too much time on that subject, but yet to

—1,865—

indicate the great importance that all of the officers think it plays in our business, I would say that we realize that perhaps first and foremost, it is necessary for the companies to give good service at proper rates; reasonable rates they must be.

4162 It has been said that the customer, if he has good service that is continuous and no outages, and that he pays reasonable sums for it, really isn't very much interested in the general problems of the company as to how we got that way. But I don't think that we can assume that the furthering of public relations stops with giving good service at reasonable rates.

We could do that and we would have bad public relations if we said to Community Fund, "No, we are not interested
4163 in that aspect; we are giving good service at reasonable rates. That is all the public can expect."

We would not be furthering good public relations by merely giving good service at reasonable rates if we said to the committee which annually comes to us in connection with the mid-summer festival, "No, that just costs us money; we have to put on a lot of street cars and everybody uses a pass anyway, so we don't get any money out of that." We can't say that and have good public relations even though we give good service at reasonable rates.

The point is that we have to do a lot of things, some of
4164 which are time-consuming, some of which are reasonably expensive, some of which we may feel we could possibly get

along without. But it is a part of the job of all industry to take its reasonable share in the community in doing these things that the general public likes to see done and that have to be done by somebody.

When I say that general executive officers, within the limits of their capacity, appreciate fully the importance of public relations, we think in terms of all of these matters that I have just discussed with you.

The general executive officers of the company are responsible for building up the supervisory staffs of the other officers under them. Only as they succeed in doing that will their jobs be lighter and the service better. No one man or group of men and no general executive officers can hope to do all the detail work that goes on in a large corporation. That is one of the most short-sighted policies that the executive officers could adopt would be to unnecessarily skimp on people who are really able to do things, who work for them.

We believe that positions should be adequately manned; 4166
we believe in hard work; we do work hard. I think we have a very good and loyal staff.

In connection with a statement concerning this staff, you will find that they stick with us. Our record will show that there have been very good accomplishments and I believe that under the guidance of Mr. Way, who has remarkable insight into men, that we have succeeded in getting, building up,

—1,867—

an executive and supervisory staff that has helped solve a lot of our problems, and if those men are good, they pass on that quality down through the line as far as you go. 4167

That is the job that we tell them they must do.

Getting to more prosaic subjects as to what the general executive officers do, we come to the question of purchasing, and while the detailed purchases of materials and supplies are not reviewed except as they are a component part of an approved budget, we do go over the purchases of coal, wire, machinery, and many other things.

I, personally, sign contracts after they have been executed by the department heads and officers doing the work. For example, just before leaving, one of the items required

4168

for Port Washington No. 2, which we thought we ought to get early and put in even in advance of the plant, were two traveling screens.

The plant will not be up for two or three years, but the officers in the power plant department said, "Why not buy these now since we are committed to it. They are cheaper now and we can put them in and we will have a better area for flow of water through the screens than we have now, when, sometimes, things back up or get trash on the racks,
4169 or sometimes thousands of fish come in."

If you have a limited screen area, it is just the more difficult to keep the fish off, although now we have somewhat

—1,868—

automatic means of doing that. I have seen fish on the floor of the condenser room knee deep when at certain times of the years these hordes of fish come in the intake, through the trash racks and up on to the screens to the point where if we hadn't been able to use emergency methods to get these fish off, the plant would have had to shut down.

It was then we had to devise these semi-automatic meth-
4170 ods of removing fish. So you see we get into a lot of strange things in this business.

The general executive officers have much to do with construction and development. I think I could talk—but will not—for two hours, on the many contributions that our president has made in his diligent search for improvements in the art of electric generation and transmission, and even in the field of street railway operations, the stories are most interesting.

I know that he wouldn't take full credit for them. He would say, as he usually does, that the boys down the line

got the ideas and he just helped along with the fortitude, because it does take fortitude to do as he did in 1920—spend millions of dollars to put in powdered fuel in the first installation in the world, when all the technical societies were stating that it couldn't be done.

I remember, of my own knowledge, that two years after that plant was in and operating with remarkable efficiency, the engineering societies were still debating that it wouldn't

—1,869— 4172

work.

Then he invented the articulated train process of taking two whole street cars that looked pretty bad, remodeling them and putting a single truck under two of them and a vestibule connecting so that they would carry large numbers of people in the rush hours.

He has been instrumental, together with the officers, in developing a good many splendid ideas and I merely mention a few and very briefly in order to say something on this important topic of what the general executive officers do in the way of construction and development of the business, 4173 and it is really more far-reaching than our own business because I ask you to consider how many utilities in the country now use powdered fuel as a result of our early experiments and developments, what the millions of dollars of saving have been to customers in this country.

The subject of financial matters, which have to be handled by the general executive officers, is a week-end topic and I think, perhaps, it would be best to say just at the moment that the general executive officers naturally have to be very busy on questions of finance, irrespective of how much help

4174 they get from North American Company, which they do.

We have pretty well covered, I think, the things that Mr. Schmidtman has told you about promotion of our business and in my brief comments on the same subject this morning, what we are striving for in the way of increasing

—1,870—

the business.

Undoubtedly he has told you about our experiments to make the general public conscious of the existence of electric
4175 service, by the free electricity offer that we had in 1934, and I believe in 1935.

Being very close to that and bearing about the same relation to it that Mr. Way did powdered fuel, I looked a good deal askance at advertising that customers could use all the electricity that they wanted in certain months following the month of March for the amount that they paid in the month of March.

We got some very remarkable responses, but everybody knew about electricity when we got through, and we made money, and we accomplished a separation, an increase, in
4176 the use of electric service by residences, compared with that of previous years, which was quite noticeable—that is, in a nest of curves which showed the gradual increase from year to year up to 1934. When this was put in, there was a permanent hike in the thing. One lady told me that she had an electric roaster and she was heating the baby's bath water in it and bathing him in it.

I heard of an ingenious gentleman who got coils of copper wire and wound it around the gas water heater and then proceeded to heat the water with electricity that normally should have been heated by gas.

—1,871—

4177

Those things aren't said to indicate practices that we approve of or to represent the purposes of this experiment, but more to indicate to you that the extent to which people gathered the idea that there was a company selling electricity in Milwaukee was tremendous.

Then we followed with the ten-for-one plan, which Mr. Schmidtman probably described, and are continuing to get, I think, remarkable results.

4178

The most remarkable thing about it is that this plan so operates, as he told you, namely, you can get 100 per cent. increase in the use of service for a 10 per cent. increase in the bill. While you are getting that saving in electrical energy for a period of four or five years, if you don't increase your use after the first rise, you are helping to pay the instalments on the piece of apparatus because of the increase in the use of service through this saving in electricity, and the dealers are very enthusiastic about it.

4179

While it has been extended on a year-to-year basis and expires, I think, by limitation in July, 1941, we wouldn't dare not go out to the Commission and say we want to extend this thing and we wouldn't wish to go out and ask them not to extend it.

There were 118,000 people in the month of August that used 25 per cent. more kilowatt hours than they did in the preceding August under this plan. On the increased energy, we received an average rate per kilowatt hour of 1.44 cents.

—1,872—

I think I am prepared to drop the general executive officers.

4180 *Gould W. Van Derzee—By Respondents—Direct*

Mr. Browning: Could we have a short recess?

The Examiner: Yes.

(Whereupon a short recess was taken.)

—1,873—

By Mr. Browning:

Q. Now, will you describe for us the operating staff of Wisconsin Electric Power Company? A. One of the principal officers who reports to the general executive officers is
4181 Mr. G. G. Post, Vice-President in charge of power. Mr. Post resides in Milwaukee. He is 58 years old and has had 34 years of service with the company. I remember George when I arrived at the University of Wisconsin as a freshman. He was an instructor and he lived at Madison at the time, and my belief is he has lived his entire life in the State.

He is responsible for the power plant electric distribution and plant engineering departments which I shall attempt to describe briefly in a few moments.

Mr. Post entered service as an electrical engineer assistant in 1906. Previous to that time his residence was in
4182 Madison where he was an instructor in the State university. He was elected to his present office on December 16, 1929.

Mr. Post is a very high grade engineer and he is active in national and local engineering circles. Under his direction are 1,436 employees. His immediate technical assistant is Mr. Carl P. John. Mr. John's place of residence is Milwaukee. He is a man 40 years old and has had 13 years of service with the company.

Mr. John does a great deal of work in connection with

—1,874—

preparing preliminary reports on the advisability of going ahead with different types of power plants and generally assists Mr. Post in technical matters.

One of the principal departments under Mr. Post is the electrical distribution department and at the head of that department, which has 735 employees, is Mr. W. E. Gundlach who has the title of Chief Electrical Engineer. Mr. Gundlach lives in Whitefish Bay, a close-in suburb of Milwaukee. He is 53 years old and he has been with the company for 30 years. 4184

As Chief Electrical Engineer he is in charge of construction, operating engineering and testing divisions. Mr. Gundlach entered the services of the company in 1910 as a draftsman. He was previously engaged in attending the University of Missouri. He assumed his present duties on November 1, 1939.

There are five principal divisions of the electrical distribution department under Mr. Gundlach and the first of these is the construction division which has 303 employees and is headed by Mr. F. E. Wilterding, Superintendent of Construction. 4185

Mr. Wilterding's division has charge of construction, maintenance, and so-called installation. The construction work relates primarily to the overhead and underground lines, rural sub-stations having a capacity of less than 1,500 k. v. a., meter installations and customer sub-stations.

The most typical type of a customer sub-station is one

of a large customer buying primary power under which rate the customer provides his own transformer facilities.

4186 *Gould W. Van Derzee—By Respondents—Direct*

Mr. Wilterding also has supervision over a stores division of the electrical distribution department. The second largest division under Mr. Gundlach is known as the operating division with 282 employees under the directions of Mr. O. M. Ward, who has the title of Superintendent of Operations.

Mr. Ward lives in Milwaukee. He is age 55, and he has had 23 years of service with the company. I happen to know that he is a graduate of the University of Illinois.

4187 This division under Mr. Ward has charge of the load dispatchers, station operation, electrical trouble service and local agents. He also has charge of station construction covering sub-stations having a capacity in excess of 1,500 k. v. a., and he has charge of the construction work for the electrical end of power plants. It is also his duty to operate the record department of the electrical distribution department.

Mr. Ward is a very fine man in this field. He knows the whole subject extremely intimately and he is a very industrious worker day or night. In case of trouble you will

4188 always find him out in the field.

The third division of the electrical distribution department is the enginering division under Mr. C. D. Brown, Electrical Engineer.

Mr. Brown lives in Wauwatosa, which is another so-called

—1,876—

close-in suburb of Milwaukee. Mr. Brown is 53 years old and has had 24 years of service with the company.

Mr. Brown's division passes on a great many highly technical problems. He has to do with system planning, transmission and distribution engineering, overhead and

underground station engineering, electrolysis surveys.

The fourth division of the electrical distribution department is known as the electrical testing division with 66 employees under Mr. J. E. Miller, General Foreman. In this division is done all testing of meters on customers' premises and in stations. I would like to record that the electrolysis work is done under Mr. Miller and not under Mr. Brown as previously stated.

The fifth and smallest division of the electrical distribution department is the general office division with 27 em- 4190
ployees under Mr. W. S. Wilder, and he has the position of Technical Assistant.

Mr. Wilder lives in Whitefish Bay. He is a graduate of the University of Wisconsin, 44 years old, and he, also, is a veteran in the service, having been with us 21 years.

I will describe a little later the veteran's organization, qualifications for which are 20 years of continuous service with the company.

The other major department under Mr. Post's direction is the power plant department which has 606 employees, exclu-
sive of Mr. Fred Dornbrook, Chief Engineer of Power Plants. 4191

—1,877—

Mr. Dornbrook is a genius, if that term can be applied to power plant operation. He is responsible for the operation, maintenance construction and design of power plants and the heating division. He has been with the company 39 years and his age is 59, and he also is a local resident of another very close suburb which abuts Milwaukee, called Shorewood.

Engineers from all over the country consult Mr. Dornbrook on power plant matters, and he is probably the best example of a man with a very meager education who has risen

4192 to tops in his profession. Mr. Dornbrook never had the advantage of a technical education, but he went to work relatively young with the company and has come up through all of the power plants and has had a great deal to do with the successful development of high pressure steam.

He is a man who seems with respect to turbines to have almost the intuition of a woman with respect to certain things. Mr. Dornbrook will look at a turbine, listen to it, put his hand on it, and tell you just about what is the matter
4193 on the inside if there is anything the matter. Altogether, he is one of the very remarkable power plant engineers and has much to do with the very fine record of continuous operation which our companies have in the rendering of service and in the efficiency with which the kilowatt hours are generated.

Under Mr. Dornbrook are two Assistant Chief Engineers:

—1,878—

Mr. J. G. Lawrenz and Mr. M. C. Drewry. Mr. Lawrenz lives in Milwaukee and his age is 46. He has been with the company some 23 years. In addition to assisting Mr. Dornbrook in certain technical matters, he has charge of the gen-
4194 eral office of the power plant department.

Mr. Drewry also lives in Milwaukee. He is age 40 and has been with the company some 16 years. Mr. Drewry, under Mr. Dornbrook, handles more of the practical operating problems, as an assistant to Mr. Dornbrook, as compared with the problems which Mr. Lawrenz handles. Mr. Drewry in his own right is a national authority on treatment of water in boilers. He has given many papers before technical societies and many times companies have come to us for information with respect to his achievements in preventing the deterioration of pipes in high pressure boilers. That is a

larger subject than it sounds like and much more important than would appear from the short time it has taken in telling about it.

Mr. Drewry has been in council with engineers of the other North American subsidiaries in connection with many matters, but directly in connection with feed water treatment.

Our largest power plant is the Lakeside Power Plant. It requires 182 employees in the power plant department to operate that plant. That number is exclusive of the number 4196
of electrical workers under Mr. Gundlach, reported on under the electrical distribution department, but the general opera-

—1,879—

tion of the plant is in charge of the so-called Engineer in Charge, Mr. George Hummel.

Mr. Hummel lives in South Milwaukee, not far from the plant. His age is 58 and he has been in the service of the company 21 years.

George can almost look out the window and see if any smoke is coming out of the plant stack. That is one of the 4197
pains of existence of power plant operators, having people tell you that your stacks are smoking.

The Port Washington Power Plant, of which you have heard, has 55 employees under Harry Shaver, Engineer in Charge. Again all of these numbers of employees which I indicate as being under the Engineer in Charge are exclusive of the electrical people who operate switchboards and who are under Mr. Gundlach.

Mr. Shaver lives in Port Washington, also in sight of the smoke stack of the plant. He is 54 years old and he has

4198 been with the company 10 years. Mr. Shaver, I recollect very well, is the man who had charge of the small municipal plant that was in operation when the company built the Port Washington plant, and incidentally there it acquired the municipal distribution system and a small power plant in the city of Port Washington, and it is a fine tribute to Mr. Shaver that he could rise to the heights and become the Engineer in Charge of the world's most efficient power plant, from a very small municipal plant operation.

4199 —1,880—

It is a question of the man having it in him rather than any particular extensive training that he had.

Mr. Dornbrook also is a great developer of men to operate under. Much of the success of his various plants is due to telling the men what he knows and getting them to do it.

The Commerce Street Power Plant has 57 employees and is under the direction of Mr. Frank Leach as Engineer in Charge.

Mr. Leach lives in Elm Grove, another suburb of Milwaukee, not quite so close in. The age is 56 and length of
4200 service 28 years.

The East Wells Street Power Plant has 21 employees and is under the direction of Mr. Thomas Franks, Engineer in Charge.

Mr. Frank's residence is in Milwaukee. His age is 60, and he has been with the company for 23 years.

That is the plant that is about to be changed to a much larger plant so that the duties of the Engineer in Charge will be materially increased and will undoubtedly fall upon the present engineer.

 4201

The Stephenson Building Power Plant is a small plant used entirely for heating. It has 17 employees and is under the direction of Mr. Edward Hass.

Mr. Hass lives in Milwaukee. He is a man 52 years old and he has been with the company for 23 years.

We have at Racine a small power plant under the direction of Mr. H. H. Lueschke. There are 13 employees in this plant under Mr. Lueschke's direction. Mr. Lueschke is 48

years old and he also has been with the company for 23 years. 4202

In the power plant is a division called the equipment testing division, under Maurice Fitze, a Test Engineer. There are 10 employees in this division. Mr. Fitze lives at another suburb of Milwaukee called Hale's Corners on the rapid transit lines about 20 minutes from dowr town. His age is 39 and he has been with the company for 16 years.

Construction and design division with 7 employees is under the direction of the Chief Designer, Mr. F. F. MacMillen.

Mr. MacMillen is 59 years old, has been with the company 8 years and lives in Milwaukee. 4203

The last division of the power plant department is the heating division with 31 employees under the general direction of Mr. Henry Warhanek as Superintendent of Heating.

Mr. Warhanek lives in Milwaukee, his age is 49 years, and Henry has reached the dividing point of 30 years, just mid-way between a regular veteran and a double veteran.

He has charge of the distribution system for heating as distinguished from the plant operation that supplies the steam for the heating system.

(Discussion off the record.)

Q. Mr. Van Derzee, I think you omitted to mention the chemical and physical laboratory of the power plant department. A. That is true. The chemical and physical laboratory

—1,882—

with 5 employees is under Mr. W. O. Pflaum, Chief Chemist.

Mr. Pflaum is also a resident of Wauwatosa where he is very active in civic affairs. His age is 56, he has been with the company for 24 years.

We have a large division called the maintenance division
4205 which is distinct from power plant operation but is under the direction of Mr. Fred Dornbrook. It is called the maintenance division and the head of that division is Mr. Henry Dornbrook. Mr. Henry Dornbrook's title is Master Mechanic.

Mr. Dornbrook lives in Shorewood, he is 59 years old and he has been with the company for some 37 years.

It is a duty of the mechanical division to see that all the equipment is kept in state of repair which will give continuity of service. To that end, each of the major power plants has a well equipped machine shop so that in case of
4206 breakdown of minor pieces of equipment, repairs can be made promptly.

This division also affords a place where men who are employed on the heating system in the winter time can find work in summer time when most of the repairing is done by the maintenance division. Altogether, it is an extremely important division and it is headed by a very competent individual. Henry seems to be able to apply to the maintenance of power plants the same kind of genius that his brother Fred gives to power plant operation.

4207

The third department under Mr. Post is the plant engi-

—1,883—

neering department which is headed by Mr. H. A. Luber, who has the title of Chief Architectural Engineer. Mr. Luber lives in Whitefish Bay, he is a man 47 years old and he has been with the company for 30 years. He is in charge of drafting, engineering, specifications, building maintenance, heating and ventilation of buildings and air conditioning.

Mr. Luber entered the service of the company on June 27, 1910 as an architectural draftsman. He was previously em- 4208
ployed in Milwaukee in a local architect's office as a draftsman, so that Fred has lived most of his life in Milwaukee and spent nearly two-third of that working for the company.

Under Mr. Luber is a small general office division of 6 employees and in his drafting office are employed 45 draftsmen and engineers who work on building, mechanical and electrical problems.

Under him is Mr. F. C. Schroeder, Building Engineer. Mr. Schroeder lives in Milwaukee, is 57 years old and has been with the company for 24 years.

4209

(Discussion off the record.)

There is a building maintenance division under Mr. E. A. Bolzendahl, the Building Superintendent.

Mr. Bolzendahl lives in Milwaukee, he is age 46 and he has had 25 years of service with the company. He has been employed in various capacities. He is a regular bull dog for work. He is usually found out in the field bossing a big

—1,884—

construction job like at Lakeside or Port Washington in respect to the building operations only.

4210 While we are glad to have him take up the work of preparing to defend this country, we are sorry to see Mr. Bolzendahl leave us shortly for anywhere from one to four years, he says, to be a Colonel in the U. S. Army.

Under Mr. E. W. May, a Mechanical Engineer, fall the problems of heating, ventilating and air conditioning on the properties of the company. Mr. May is relatively new but a very conscientious and competent individual with the company.

4211 His place of residence is Milwaukee. He is 41 years old and he has been with us for two years.

That ends the general description of the major divisions and sub-divisions of the departments constituting 1,436 employees under the direction of Mr. Post, Vice-President in Charge of Power.

The Examiner: We will recess until 10:00 o'clock tomorrow morning.

(Whereupon, at 4:30 o'clock p. m., the hearing was recessed until 10:00 o'clock a. m., Wednesday,

4212 September 25, 1940.)

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

4213

4214

Hearing Room 609,
Securities and Exchange Commission Building,
Washington, D. C.,
Wednesday, September 25, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

4215

S. PEARCE BROWNING, JR., and
CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

HERMAN O'DELL,
MISS E. H. CALKINS, and
C. M. MAXWELL, attorneys on behalf of the Securities and Exchange Commission.

4216 *Gould W. Van Derzee—By Respondents—Direct*

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon, GOULD W. VAN DERZEE resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

Q. At the close yesterday, Mr. Van Derzee, you had finished describing the departments in charge of Mr. Post
4217 who is vice president in charge of power. Will you now describe the departments under Mr. Coffin, vice president and sales manager? A. First, I would like to say with respect to Mr. Coffin that he is sixty years old, has been with the company for twenty-eight years.

He is a resident of the Village of Shorewood, which abuts the north limits of the City of Milwaukee.

Mr. Coffin is in charge of the operations of the sales and the advertising departments. He is a graduate of the University of Illinois in electrical engineering. He worked his way through college and came with our company on
4218 January 15, 1912, as a draftsman.

He had previously had a position with the Commonwealth Edison Company in Chicago in a similar capacity. Mr. Coffin is quite active in the civic affairs of the community and he is really a powerful figure in good public relations that

our company enjoys.

One of his chief characteristics is his extremely kindly disposition and expression and everybody thinks very highly of him. I think he is the kind of man that you need in a sales and advertising department.

He has the facility of passing on down to his men his own personality. In Mr. Coffin's sales department are 209 employees. One of the very important divisions is the appliance service division headed by Mr. C. M. Berry, who is superintendent of appliance service.

Mr. Berry lives in Shorewood. He is 52 years old and he has been with the company thirty-four years. He is what you might describe as a never-tiring public servant. There is probably no one thing that the customer wants done faster than restoring something the matter with the appliances. If the refrigerator is out of service day or night and if it is an important job, Mr. Berry, himself, may be on the job.

He naturally has various people who are scheduled to appear day or night for different kinds of appliance trouble. There are minor troubles which are handled by the trouble department of the company, which is different from what we call the appliance service department.

When we placed Mr. Berry's activities under the sales department years ago, we did it because we thought that no one could have a better understanding of the problem of the

customer and his servicing needs than the management of the department that sells the customer the appliances and service.

In the sales department there is a small general office division headed by Mr. Mackowski, assistant to the sales manager. Mr. Mackowski lives in Milwaukee, he is 46 years of age and he has been with the company for twenty-three years.

We have a home service bureau which is under the sales department with thirteen employees which is headed by Mrs.

4222 Vera Ellwood. Mrs. Ellwood has a position of Director of Home Service.

Mrs. Ellwood is 58 years of age. She has been with the company for fourteen years. She came to the company with a very fine background, home economics, the University of Wisconsin, and teaching experience in the extension division and vocational schools in matters relating to home furnishings. I think that Mrs. Ellwood probably knows more women in the City of Milwaukee in all the various strata,
4223 probably, than any other one person.

She is one who can gain the confidence of almost any woman who comes to see her and she makes many calls by request at the homes of the women of the community. Many of these calls result from home service girls who travel from home to home and in connection therewith they ask about Mrs. Ellwood and will she come and see them.

Another larger division of the sales department is the

lighting and rural sales under the direction of Mr. I. L. Illing, illuminating engineer. Mr. Illing lives in Milwaukee,
4224 he is 43 years of age and he is almost a veteran. He has been with us some nineteen years.

Mr. Illing is in charge of all lighting operations and he is recognized in the community as a very able citizen and lighting engineer. He has devised for a great many special occasions very neat lighting effects.

We have a lecture with a set of portable apparatus that he designed. It is taken out before those who call for such a program, and showed to groups under the heading of a lecture called "The Miracle of Light". That has been going now for about two years and the demand for it never ceases.

4225

It is an educational experience in what you can do with light in business, in the home, in the factory. It always is kept up-to-date with enough of the modern things like cold lighting, fluorescent lighting, to make it interesting, even to children of school age.

Then we have the merchandise stores with twenty-seven employees, under the direction of Mr. Elmer Stocker, with the title of Superintendent of Merchandise Sales. Mr. Stocker lives in Milwaukee, he is 45 years old and has been with the company eighteen years.

4226

Mr. Stocker's business is to actively push the sale of that type of merchandise that we think needs the push that the

—1,890—

company can give it, and emphasis, as I said yesterday, is placed upon those electrical devices that are not taken off the counter in the department store and the electrical dealer.

Those things that have not received full customer acceptance are the things that our merchandise department pushes, together with our field forces.

Q. Your merchandise department sells these appliances which you feel need pushing? A. That is true; but we sell them at regular standard prices and we do not indulge in practices that any small dealer can not indulge in.

4227

We have a power sales division with sixteen employees under the direction of Mr. O. O. Wagley. He is the superintendent of power sales. Mr. Wagley came with the company a number of years ago when the company absorbed the Wells Power Company, a predecessor company operating in the City of Milwaukee, so he came to us with a good deal of experience that a manager of a small property gets with all types of customers.

4228 Wagley is 62 years old, very active, and he has been with the company for thirty-three years. I think he knows most of our customers personally and at some time or other and perhaps frequently has been through the factory of each and had something to do with the making of a report on power facilities.

—1,891—

Mr. Wagley is the type of man that you know is just honesty itself when you look at him. When he gets out a
4229 report for a company, say, that has considerable use for by-product steam, and can more advantageously put in a small turbine in connection with buying some service from the company, he will tell that customer that that is what he ought to do. Correspondingly, if it isn't the thing, he and his salesmen will tell the customer that he ought not to put in a diesel engine for this or that reason and rather generally it works out from experience that when they depart from the advice of that bureau, they come back again to the company after a period of a few years.

For the selling of ranges, we have a special division
4230 which sells nothing but electric ranges. There are fifteen men in the division and it is under Mr. Christopherson. He is known as the superintendent of range sales. Nels, as we call him, has a very large experience with the company.

He started in working in the former Central Heating Company, then he went with the sales department and has gradually become very proficient in dealing with cooperative dealers who handle electric ranges in the city and in handling his own sales force and keeping away from antagonism with dealers, although we, too, sell electric ranges direct.

 4231

Mr. Christopherson is 57 years of age and it was with great pleasure that not many months ago I could go into his

—1,892—

office and say "Nels, congratulations on becoming a double veteran with forty years of service."

He will receive his double veteran's emblem at the annual meeting of the veterans just before Christmas.

Similar to the set-up by which we sell electric ranges, we have a division that promotes the sale of electric water 4232
heaters and there are twelve in that division under the direction of Mr. M. Zass, superintendent of water heater sales.

Mr. Zass is 52 years old and has been with the company twenty-seven years. Electric water heating is somewhat of a new venture with this company, that is, compared with other promotional plans.

We have been selling electric water heater service now for five or six years and it has been, as is the case all over the country, an up-hill proposition because it hasn't as yet gained the popular acceptance that the electric range has. 4233
Give it another five years and electric water heaters will be sold off the shelf.

I happen to know that right now Sears-Roebuck & Company, whom I consider to be among the best merchandisers in the world, is planning to take a substantial part of the output of A. O. Smith Company which has recently announced that it is making a line of glass lined water heater tanks.

A. O. Smith is one of our customers and they have been making large glass lined vessels for the beer industry and

4234 now they have gone into production on these small water

—1,893—

heater tanks with glass lining.

Of course, that is a fine thing for the water heater trade. I think we can look for big things in Mr. Zass' department in the coming years.

In the advertising department, which is under the direction of Mr. Coffin, there are seven people headed up under Mr. F. E. Erikson, advertising manager.

4235

Mr. Erikson is 55 years old, has been with the company for sixteen years and he is doing a good job in this field. This is one of those joint departments, that does a very substantial amount of work for the Transport Company, just as that department did for the transportation business before the corporate separation two years ago.

That completes the description of the departments and the personnel under the vice president and sales manager, comprising in total 216 employees.

Q. Will you describe for us now the departments which

4236 are under Mr. L. F. Seybold, vice president and research engineer? A. Mr. L. F. Seybold, usually known around the office as Sey, lives in Wauwatosa. He is 43 years old and has been with the company for twenty-one years.

Mr. Seybold is a graduate of the University of Wisconsin and he came with the company after entering the service in the first World War on April 1, 1919, as an engineer in the

—1,894—

research department, which had not been organized very long at that time.

He gradually advanced, as time went on and because of his great ability, to assistant research engineer and then to research engineer, assistant vice president, and then to vice president and research engineer, which position he has had since October 20, 1938.

I think that anyone who has had contact with Sey in this very important research work, thinks of him as a prodigious worker, a man of great intelligence and loyalty.

Many of you have undoubtedly come in contact with him 4238
in connection with some of the security matters. I probably don't need to go into his many good points. I will wish to describe later the functions of this research bureau which services all of the companies in our Wisconsin-Michigan group and very effectively and efficiently.

Under Mr. Seybold's direction is the operating research bureau, having a total of seventy-seven employees. First, we have the assistant research engineer, Mr. John Dockendorf. Mr. Dockendorf is 51 years of age and has been with the company for twenty-one years. He has charge of the transportation and engineering division of the research bureau, 4239
handling of the internal auditing division which audits in a special way the accounts of Wisconsin Electric Power Company, Wisconsin Gas & Electric Company and The Trans-

port Company.

He has charge of the statistical division and special investigations division. Under Mr. Dockendorf are five groups in which thirty employees are engaged. There is the stenographic division with six employees, the transportation and engineering division with three employees, under the direc-

4240 tion of Mr. C. F. Balch, who lives in Wauwatosa, is forty-five years of age and has been in the service of the company twenty-three years.

The internal auditing division is also under Mr. Dockendorf, headed up by Mr. R. J. Mathews, as supervisor. Mr. Mathews is forty-five years of age, lives in Shorewood and has been with the company for seventeen years.

Then we have the statistical division under the direction of Mr. R. W. Schmelz, as supervisor. Mr. Schmelz is thirty-
4241 six years old, has been with the company fourteen years. He has a great facility for gazing in the crystal globe and picking out how many kilowatt hours we will sell next year.

Then, a gentleman about whom I probably do not need to say very much as he has been with you for several days in the person of Mr. E. H. Schmidtman, known as Ed, who has charge of special investigation division of eleven employees. I think that most of his qualifications have been given and I think that you have been in a position to judge yourselves a good deal of his character.

Ed is a man of many parts, keen intellect, very hard
4242 worker, valuable employee of this company.

—1,896—

His services in that capacity are devoted to the interests of a group of properties.

We have another research engineer, Mr. F. L. Larkin. Mr. Larkin lives in Whitefish Bay, he is forty-three years old, has been with the company for fifteen years. He is in charge of job analysis and bonus plans, bonus calculation, employee selection training division, and the employment office.

4243

Under Mr. Larkin are some thirty-nine trained men in four groups, the first of which, with seventeen employees, is under Mr. H. P. Chamberlin, supervisor. He has charge of wage incentives, standards, methods, and job analysis.

Mr. Chamberlin lives in Wauwatosa, is thirty-six years old and has been with our company fourteen years.

The bonus calculation division with twelve employees is also under Mr. Larkin indirectly, but is headed up by Mr. E. W. Gottschalk, supervisor. Mr. Gottschalk lives in Shorewood, is thirty-nine years old and has been with the company for eighteen years.

4244

A small division with nine employees called the employee selection and training division, is under Mr. A. H. Nielsen, educational director.

Mr. Nielsen is a man forty-one years old and has been with the company for sixteen years, lives in Milwaukee. As educational director he has done much to improve the trade

—1,897—

knowledge of our employees.

4245

He has also done a great deal in promoting the foreman training process. We have meetings which have probably been described at which our four hundred some foremen get together and hear about processes of management. They conduct these meetings themselves and ask questions and our representatives at these meetings really do very little except to direct the course of the discussion.

The employment office is directed by Mr. W. Pohland, as an employment agent. Mr. Pohland is forty-five years old, has been with the company for twenty-one years and he is a man with one of those remarkable memories for faces.

An individual can come in whom he hasn't seen for many years. Possibly there may be some reason why that man should not be employed by the company. Mr. Pohland's recollection sends him back to a card somewhere back in the files to find if the records check with his recollection. It usually does.

He is the first gate at which the new employee makes his application and from that point on there are very extensive selection and training tests, most of which are under
4247 the educational department, so it is natural that all of these divisions that I have just recited should be together under Mr. Larkin's general direction.

In addition, we have a third assistant research engineer, Mr. Alfred Gruhl. Mr. Gruhl is age thirty-eight and has been with the company for eight years.

—1,898—

He is assistant research engineer in charge of the very important subject of tax matters. Under him works Mr. C. J. Trudeau, who is supervisor of the tax division.

Mr. Trudeau lives in Wauwatosa, he is thirty-six years
4248 old and has been with the company for fourteen years.

In addition to the operating research bureau, Mr. Seybold has charge of the purchasing and stores department with sixty-one employees, under the immediate supervision of Mr. F. V. Benz, purchasing agent. Mr. Benz lives in Milwaukee, age fifty-six, and for that age it is rather remarkable that he has been with the company for forty years, which means he started as a messenger boy when he was sixteen years old.

Mr. Benz' department not only has charge of purchasing and stores, but the general operation of the public service building, which includes the janitor force.

Under Mr. Benz is the assistant purchasing agent, Mr. A. A. Misenheimer. Mr. Misenheimer is even younger than Mr. Benz, his boss. He is fifty-five years old and he also will get a double veteran medal for forty years of service at the annual meeting of the veteran's association at the end of this year. 4249

An additional department under Mr. Seybold's direction is the printing department with twenty-seven employees supervised by Mr. B. F. Dahlman. Mr. Dahlman, Bruno, as we call him, is forty-nine years old, has been with the com- 4250

pany for twenty-four years. Bruno is one of the best, most good natured printers that I think I have ever met. You can get Bruno out of bed most any time of the night when we have to print up some document to go before different bodies that require rather prompt action, not too long to get things together, and he turns up with a job of printing the like of which you can't buy anywhere and for as low a cost.

He also gets out the many advertising forms that are needed for the sales department. He prints all the transfers for the Transport Company, does a great deal of work for Wisconsin Gas & Electric Company and various kinds of forms that they need. 4251

Quite recently, Wisconsin Gas & Electric thought it would go shopping and see how really effective our printing service was and they found that the form was quite a little cheaper when obtained from this joint printing department. Work is also done for Wisconsin Michigan Power Company.

As a matter of fact, as I will probably describe later——

4252 *Gould W. Van Derzee—By Respondents—Direct*

(Discussion off the record.)

The Witness: Read my last answer.

(Whereupon, the answer above recorded was read by the reporter.)

A. (Continuing) —in more detail, Mr. Dahlman's printing department prints the passes for the Capital Transit Company.

—1,900—

4253 Q. Will you now describe the department of the secretary and treasurer? A. As presently constituted, the department of the secretary and treasurer is under the direction of Mr. H. J. Boehm. Mr. Boehm is one of our oldest and most valued employees.

(Discussion off the record.)

A. (Continuing) Mr. Boehm is seventy-three years old and has been with the company for fifty-eight years. His qualifications have been previously given.

4254 In Mr. Boehm's department are six secretaries and stenographers, under his general direction, and the accounting department.

The accounting department with 317 employees is under the immediate supervision of Mr. A. J. Bohl, controller. Mr. Bohl is also assistant secretary and assistant treasurer. Mr. Bohl is a resident of Milwaukee. He is fifty-four years old and has been with the company thirty-nine years.

As controller he is in charge of all accounting. He entered the service of the company on July 1, 1901, as a mes-

senger boy in the accounting department. He is a native of Milwaukee and this job was his first and only job.

He was appointed to his present office on March 24, 1926 —that is, to the position of assistant secretary and assistant treasurer and although he has been acting as controller for a number of years, he was first officially appointed con-

troller by the Board at its annual meeting in 1940.

As a direct assistant to Mr. Bohl, we have Mr. L. M. LaPorte, assistant secretary and assistant treasurer. Mr. 4256
LaPorte lives in Wauwatosa, he is forty-three years old and has been with the company for twenty years.

Mr. LaPorte is in charge of customer accounting and he entered the service of the company on April 5, 1920, as an accountant. He had been previously employed by a large industrial concern and acquired experience in that capacity. His position as assistant secretary and assistant treasurer dates from May 16, 1932. It has been under Mr. LaPorte's direction that much of the progress has been made which has given the Milwaukee Company the lowest customer accounting costs of any comparable sized company in the country. 4257

That was one of the accomplishments that was listed in the Coffin Award which I will describe a little later, given to Wisconsin Electric Power Company for its performance in the field of electric light and power last summer by the Edison Electric Institute.

Under Mr. LaPorte's direction are the 317 employees that I mentioned of which 221 are in the customers' accounting division under the direction of Mr. A. G. Neumann, auditor of customers' accounts.

4258 *Gould W. Van Derzee—By Respondents—Direct*

Mr. Neumann lives in Milwaukee. He is a man forty-four years old and he has been with the company for seventeen years.

—1,902—

The report and development division under Mr. T. W. Gehl, as supervisor, has twenty-two employees. Mr. Gehl is thirty-one years of age and has been with the company for five years, but he occupies a very important position in that his work is in effect a miniature research bureau which is a
4259 part of the accounting department and devotes almost all of its time to finding new ways and methods of keeping the Milwaukee company on top as far as accounting costs are concerned.

It is his job to see that we stay there.

There is another division known as the mechanical accounting division under Mr. H. J. Fillhouer as supervisor. This is a division where all of the various accounting machines of various kinds, tabulating machines, are located.

Mr. Fillhouer is a man thirty-seven years old, lives at Fox Point, one of the outlying suburbs, and has been with
4260 the company for fifteen years.

That division has just been rejuvenated with respect to its quarters under Mr. Fillhouer's direction. We put soundproofing on the wall, new floors, different arrangement of the machines. You can go in there and hear these machines that heretofore made lots of noise, just audibly clicking away.

It has much to do with the comfort and I think output of the department that performs a very important service and the work it does at the end of the month is intimately associated with the closing of the books.

—1,903—

4261

We have a division under Mr. J. A. Wolfrum, paymaster, which is called the payroll and timekeeping division, with twenty employees.

Mr. Wolfrum is forty-four years old, lives in Wauwatosa, and has been with the company for eighteen years.

This division is sometimes called the centralized payroll department. We are gradually taking all the payroll work from the various divisions and departments and concentrating it in the centralized payroll division, with benefits of considerable magnitude.

4262

We have a cashier's division under Mr. J. W. Mielke, cashier, under whose direction there are eighteen employees. Mr. Mielke is a resident of Milwaukee, is fifty-four years old, and he has been with the company for twenty-eight years.

The last division of the so-called accounting department covers the employees who are associated with the Employees Mutual Saving Building & Loan Association.

They are under the general direction of Mr. LaPorte, who is an officer of the Association, but their expenses are naturally kept separate and are charged against the association.

4263

There are twenty employees in that group.

Aside from the customers' accounting division, we have several smaller groups that are directly under Mr. Bohl as controller and one of these is the general accounting division

with twenty-three employees, under the immediate supervision of the general auditor, Mr. W. A. Gauger. Walter Gauger is a resident of Milwaukee County. He is out in the rural district by choice, he is forty-eight years old and he has been with the company for twenty-nine years. I should

say he has been with this company and its predecessors, because he, too, came with the Wells Power Company.

He is general auditor in charge of the general accounting division.

We have accounts payable division with nine employees under the direction of Mr. S. R. Hatch, as auditor of disbursements.

Mr. Hatch lives in Whitefish Bay. Sam is sixty-one years old and has been with the company for nineteen years.

4265 Then we have the property and plant division reporting directly to Mr. Bohl, with thirty employees under the direction of Mr. R. L. Stiles. Mr. Stiles is the supervisor. This is one of the really modern departments of the company. It is the one where the property records are kept.

For many years, we have tried to keep our property up to date. We started with the valuation made by the Public Service Commission as of January 1, 1914, and since that time have analyzed work orders covering each specific job and properly tied it in with the books so that we can produce authentic records and in considerable detail of all the prop-

4266 erty that the company owns.

—1,905—

It isn't exactly a continuous inventory, but it is a direct book record of dollars and cents and we have used the net additions of property thus added—that is, taking away from the additions, the retirements—as a direct addition to the valuation of January 1, 1914, corrected for retirements, in order to get at the rate base on which we are allowed a return.

Mr. Stiles being an engineer and also an accountant, is very ably constituted to handle that work. We have a col-

lection division that does minor legal work as distinguished from our general counsel under the direction of Mr. R. J. Schimmel. There are five employees in that division and it is located in the accounting department quarters.

Mr. Schimmel is forty-two years old and he has been with the company for twenty-two years and he is designated as being in charge of collections.

Then we have a securities division reporting to Mr. Bohl, under Mr. W. J. Muth. He is supervisor of this division of eleven people and Mr. Muth has been with the company fourteen years; he lives in Milwaukee and is thirty-nine years old. 4268

That completes a superficial description of the officers, department heads and their principal assistants and their service records.

—1,906—

If we take them altogether as a group and analyze the places they live, the time they have been with the company, their qualifications, I think we reach three rather important conclusions:

That all of them live in the service area and very close to where they work; that the average length of employment with our company has been 21.1 years; and last, that as a group they are pretty able citizens, respected in the community. 4269

Q. You have been testifying with regard to the management staff of Wisconsin Electric Power Company. Will you now describe for us the Board of Directors of Wisconsin Gas & Electric Company? A. The Board of Directors of Wisconsin Gas & Electric Company includes Sylvester B.

4270 *Gould W. Van Derzee—By Respondents—Direct*

Way, Gould W. Van Derzee, Frank J. Boehm, James D. Shaw, Stanley B. Sherman, who was elected April 25, 1940, Arthur W. Whitcomb, who was elected February 22, 1933, and Robert Sealy who was elected December 23, 1938.

All the foregoing have already been mentioned by me in detail except Messrs. Sherman and Whitcomb, but I find in omitting the dates at which the other gentlemen were elected to the Board, I was under the impression that we had given that information before, but it is not the case in respect to
4271 these companies although we have given a description of the individuals.

Mr. Way was elected to the Board of Wisconsin Gas & Electric Company January 15, 1912; G. W. Van Derzee,

—1,907—

August 29, 1917; Frank J. Boehm on February 18, 1924; and James D. Shaw on January 18, 1915.

Mr. Stanley B. Sherman, a board member whom I have not described, resides in Racine, Wisconsin, which is the home office of Wisconsin Gas & Electric Company. Mr. Sherman is fifty-nine years old. He was graduated from Armour
4272 Institute of Technology of Chicago and prior to coming to Racine, Mr. Sherman was employed by the Peoria Gas Light Company located at Peoria, Illinois, for a period of approximately eighteen years. While employed at the Peoria Gas Light Company, he served in various capacities and advanced to the position of gas plant superintendent.

He entered the employment of Wisconsin Gas & Electric Company on August 15, 1919, as gas plant superintendent at Racine. On November 18, 1938, he was appointed general manager and on April 1, 1940, was elected to the present position of vice president and general manager.

Mr. Sherman has resided in the territory served by Wisconsin Gas & Electric Company since the date of his employment, a period of approximately twenty-one years.

Mr. Sherman has, so to speak, come up through the ranks and has demonstrated from time to time the justification of increasing the importance of his position and we know that his most recent employment will be a great benefit to the company. —1,908—

Mr. Arthur J. Whitcomb resides in Whitefish Bay, Wisconsin. Mr. Whitcomb is fifty-four years of age. He graduated from the Law School of the University of Wisconsin and after graduation he entered practice of law in the City of Oconto, Wisconsin. Mr. Whitcomb continued the practice of law at this location until entering the employment of the company. 4274

On November 1, 1930, he entered the employment of The Milwaukee Electric Railway & Light Company, predecessor company of Wisconsin Electric Power Company, as an assistant to vice president William A. Jackson.

His present position is attorney in charge of contacts with local governments and that applies to his work for the Wisconsin Electric Power Company and The Transport Company, although he assists Wisconsin Gas & Electric Company. 4275

Mr. Whitcomb has resided in the territory of Wisconsin Electric Power Company and predecessor company for nearly nine years and has been a resident of the State of Wisconsin since his birth. Mr. Whitcomb has been in the company group for ten years.

Q. Will you now describe for us the functions of the Board of Directors of Wisconsin Gas & Electric Company?

A. As you will note from the description of the Board, there are only seven directors of Wisconsin Gas & Electric Company and six reside, you may say, in or near Milwaukee. Mr. Sealy lives in the east.

—1,909—

We have no executive committee of Wisconsin Gas & Electric Company and consequently the types of functions performed by the Executive Committee of Wisconsin Electric Power Company are handled before the full Board.

4277 There are also a number of other informal meetings of the Directors in Milwaukee with the vice president and general manager, which are the approximate equivalent of an executive committee meeting and out of those meetings, I am sure, that Mr. Sherman and all of us get a good deal of value.

Q. Does the Board of Directors of Wisconsin Gas & Electric Company direct all phases of its management? A. The Board of Directors of the company, naturally, directs all of the phases of the management and is in constant and intimate contact with all the affairs of the business and each director is fully acquainted with all of the affairs. Even

4278 Mr. Sealy, who does not live in the territory, gets regular reports of all operations and attends meetings from time to time.

Q. Who are the general executive officers of Wisconsin Gas & Electric Company? A. In the case of Wisconsin Gas & Electric Company there are four general executive officers —that is, officers whose duties extend generally over all of the operations of the company, as distinguished from officers who have charge of particular divisions and operations.

—1,910—

These four are Mr. Way, president; G. W. Van Derzee, vice president; L. F. Seybold, vice president and Mr. Sherman, vice president and general manager.

Mr. Sherman is really in charge of the operations of the property and it is up to him to see that the property percolates properly.

Now, we are all in contact with the activities—that is, the general executive officers that I just referred to. Mr. Sherman is out on the firing line and he is in almost constant contact with the heads of the various divisions of the company. 4280

The company is spread out so that it has to have operating divisions. He travels extensively throughout these divisions, coming in contact with the division managers, district managers, the local agents of various communities in which they operate. To him report directly all of the division managers.

Mr. Sherman, as vice president and general manager, has full authority to deal with and does deal with all matters in his territory which relate to the maintenance of the character of service which the public expects.

That means really, in other words, in all things that the ultimate customer is really and actually interested. 4281

Q. Will you describe for us the operating staff of Wisconsin Gas & Electric Company?

Just a moment, Mr. Van Derzee, before you do that. I believe that you omitted to state the approximate total number of employees of Wisconsin Electric Power Company.

—1,911—

What is that total figure? A. Approximately 2,300 employees.

4282 Q. Now, will you describe for us the operating staff of Wisconsin Gas & Electric Company? A. The next officer in line, whose name has not yet been mentioned, is that of D. G. Evans, vice president. Mr. Evans lives in Racine, the home office of the company. He is fifty-two years old and has been with the company for twenty-one years. He is vice president in direct charge of rate analysis and development, service rules and regulations and special investigations.

Mr. Evans first entered the service of Wisconsin Gas &
4283 Electric Company on January 15, 1919, as an electrical engineer. He had previously attended the State University of Illinois. He was elected vice president on November 18, 1938.

Reporting directly to the vice president and general manager are the various division managers. But before explaining their functions and describing them, I would like to add the description of the other officers of the company.

The secretary and treasurer is Mr. F. J. Boehm, who has been previously described, except that his length of service with this particular company has not been given and that
4284 is twenty-nine years.

Mr. Boehm was elected secretary and treasurer of the predecessor company, the Racine Gas Light Company, on August 2, 1911.

—1,912—

The assistant secretary and assistant treasurer of the company is Mr. L. M. LaPorte who has been previously described. Mr. LaPorte has been with this company four years in the capacity indicated.

In addition, there is assistant secretary and assistant treasurer, Mr. J. G. Johansen. Mr. Johansen has been in

the capacity with Wisconsin Gas & Electric Company for four years. Mr. Johansen is thirty-two years of age. His place of residence is Woodcliff, New Jersey.

Q. Mr. Johansen handles certain matters of the company in New York? A. He does.

Q. He holds the same position for Wisconsin Electric Power Company? A. He does.

Q. Go ahead. A. In addition, we have Mr. J. I. Allen, assistant secretary and assistant treasurer. Mr. Allen resides in Racine. He is forty-four years old and has been 4286
with the company for twenty-eight years. In that capacity, Mr. Allen is in charge of corporate records, collections, budgets and securities.

Mr. Allen entered the services of Kenosha Gas & Electric Company on July 8, 1912, and continued in the services of Wisconsin Gas & Electric Company after the merger of the former company with the latter. He was appointed to his present position on October 20, 1929. —1913—

Now, going back to the division managers——

Q. Just before you do that, Mr. Van Derzee, is Mr. Bohl an officer of Wisconsin Gas & Electric Company? A. He is 4287
also assistant secretary and assistant treasurer.

Q. And you also mentioned Mr. LaPorte. A. I did. Mr. R. I. Swift is manager of the Racine division. Mr. Swift is forty-two years old and has been with the company for eighteen years.

As manager of the Racine division, he is in direct charge of the gas and electric service rendered by Wisconsin Gas & Electric Company in the division and also in charge of the electric operations of Wisconsin Electric Power Company in Racine.

It so happens that Wisconsin Gas & Electric Company does the gas business in Racine and Wisconsin Electric Power Company does the electric business, and from the standpoint of economy of operation, and the joint use of the forces and because, further, the home office of Wisconsin Gas & Electric Company is at Racine, we have an operating arrangement approved by the Public Service Commission of Wisconsin, that various—practically all the operating functions that would otherwise be required of employees of Wisconsin Elec-
4289 tric Power Company are performed by Wisconsin Gas & Electric Company——

(Discussion off the record.) —1,914—

A. (Continuing) —at Racine, under Mr. Swift's direction as Racine manager for Wisconsin Electric Power Company.

A recent example of what Mr. Swift does is his visit to see us at Milwaukee concerning a change in the Racine street lighting situation. We worked up with Mr. Swift, a presentation that we wanted him to make before the Racine Council and he returned and made that presentation.

4290 The manager of the Kenosha Division is Mr. H. M. Pauley. Mr. Pauley has under his direction 163 employees as compared with 122 employees under Mr. Swift in the Racine Division. Mr. Pauley lives in Kenosha which is the center of his division.

He is fifty-two years old and has been with the company for twenty-two years and as manager of the Kenosha Division, he has charge of the electric, gas and transportation operations in the Kenosha Division.

Perhaps a little more detail on those operations of the three functions over which he spreads himself might properly

be given. There is the operation, maintenance and construction of the electric, gas and the transportation business, customer billing for the electric and the gas. Those bills, by the way, are sent out for electric and gas on the same bill and the same meter readers take care of reading the meters of both the gas and the electric customers.

There are problems of electric service for the electric utility, problems of gas service for the gas utility, collections for both and merchandising for each. 4292

Another division manager is Mr. W. D. Leonard, who is manager of the Western Division, with 165 employees. Mr. Leonard lives at Fort Atkinson, Wisconsin, the center of the operating division. He is a man fifty-five years old, has been with the company for thirteen years, but it ought to be stated that Mr. Leonard was an acquisition when Wisconsin Gas & Electric Company acquired the property of a Fort Atkinson local utility, and he had been with the utility business there in Fort Atkinson for many years prior to that time, so it is really an understatement of his situation as far as his length of service is concerned to say that he has only 4293 been with us thirteen years.

He is a long-term resident of Fort Atkinson, knows everybody in the district, I would say.

The work which is done by this division is spread over the electric, gas and heating operations wherever they occur. The heating operation is in Waukesha and gas is spread throughout the territory on account of the high-pressure pipe-line which provides the source of gas.

Mr. Leonard has charge of the operation, maintenance and construction work applicable to these three services,

customer billing, customer servicing, collections, and merchandising. In other words, he has charge of everything that needs to be done promptly or otherwise for any customer in his division.

—1,916—

The fourth division under the direction of Mr. W. E. Kuelthau, is known as the Northern Division, and in that division are ninety-one employees.

Mr. Kuelthau lives in West Bend, which is the operating
4295 division office. He is fifty-six years old and his service with Wisconsin Gas & Electric Company has been only eight years, but Mr. Kuelthau, like Mr. Leonard, came to the company when Wisconsin Gas & Electric Company acquired the privately owned company known as the Wisconsin Public Utility Company, which theretofore operated in West Bend and in a substantial amount of territory adjacent thereto. So he is a long-term resident of the community and I have known him for a great many years.

He is one of those sturdy type, rough diamonds that everybody knows and he gets along with everybody. He is
4296 a very effective manager of the entire division.

We have some other divisions of the company which are not described under the heading of operating division. We have the division of the chief accountant, Mr. C. F. Betts, who has thirty-two employees under him.

Mr. Betts is thirty-six years old and has been with the company for five years. He is the chief accountant in charge of accounting payrolls, bonus calculations and audits.

We come next to the chief engineer of the company, Mr. J. A. Tyvand. Mr. Tyvand lives in Racine as does Mr.

Betts. He is forty years old and he has been with the com-

—1,917—

pany for two years in the capacity of chief engineer. In that capacity all of the engineering work that requires the services of an engineer is done at Racine for all the divisions.

It is a measure of economy and centralization of engineering work that is peculiar to Wisconsin Gas & Electric Company.

Q. Why do you do it that way? A. I stated it was a matter of economy. But, in addition to local handling of 4298
distribution and transmission matters by Mr. Tyvand, all of the engineering is done in accordance with general specifications which have been prepared for construction for the three companies—Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company—and there are, in connection to these local engineering operations, many conferences between Mr. Tyvand and the engineers of Wisconsin Electric Power Company.

Mr. H. R. Broker has 110 employees under him as plant superintendent in charge of gas plant operations and main- 4299
tenance. Mr. Broker lives in Racine. He is forty-four years old and has been with the company for nineteen years.

Mr. W. L. Haight has a designation of assistant secretary. He has two employees under him and in that capacity has charge of personnel relations, labor relations, safety matters, and right-of-way purchases as required by the company.

—1,918—

Mr. Haight is fifty-six years old and has been with the company for twenty-five years.

4300 Under Mr. J. H. Dunham is one of the very important functions, that of promotional supervision. By that I mean promotion of new business. There are five employees under Mr. Dunham, who takes care of new business, merchandising and advertising.

Mr. Dunham lives in Racine. He is thirty-four years old, and his length of service—I should say here, with the companies—is ten years, because, he has recently been transferred from the sales activities of Wisconsin Michigan Power
4301 Company to bolster up the sales activities of Wisconsin Gas & Electric Company.

Quite frequently we find a collection of men in one of these properties peculiarly able to do something better than someone in one of the other properties, and although Mr. Schubert, general manager of Wisconsin Michigan Power Company told me the other day in connection with our Board meeting at Milwaukee, that he disliked very much to see Mr. Dunham leave his direct services, he was glad that Wisconsin Gas & Electric Company could get a man with
4302 the really good qualities of sales supervisor that Mr. Dunham has.

The residual sales require the employment of six persons and I am not giving the name of the man in charge right now because the placing of supervision is now in a state of flux. —1,919—

In all, there are 776 employees in the Wisconsin Gas & Electric Company organization. I think we can say with respect to that company much the same thing that was said with respect to Wisconsin Electric Power Company, that the men who have active charge of the business, full charge, to

give the kind of service that the customer wants, live in the territory where their particular functions must be performed, that they are old and long in the service of the company, that they have averaged some 15.4 years for the group from the officers down through the division managers, and their principal assistants.

My long contact with this company, which, as you may remember, dates back to being on the board of directors since 1917, gives me very definite first-hand knowledge that the important functions of this company are ably staffed. 4304

Q. We can now turn to Wisconsin Michigan Power Company. Will you describe the Board of Directors of that company?

The Examiner: Would any of you like to have a recess?

Mr. Browning: Yes, sir.

The Examiner: All right, we will have a little recess.

(Whereupon, a short recess was taken.)

Mr. Browning: Will you read the last question? 4305

(Whereupon, the pending question was read by the reporter.)

The Witness: Mr. Sylvester B. Way, elected December 9, 1924; Gould W. Van Derzee, elected November 20, 1925; Frank J. Boehm, elected February 22,

1928; James D. Shaw, elected December 15, 1927; William E Schubert, elected April 23, 1940; Arthur J. Whitcomb, elected February 15, 1933; and Robert Sealy, elected December 23, 1938.

4306

Colloquy

All of the foregoing have been described by me except Mr. William E. Schubert. Mr. Schubert is a resident of Appleton, which is the head operating office of the company, although the home office of the company is at Milwaukee.

Mr. Schubert is forty-three years old. He was graduated from the engineering school of the University of Wisconsin and prior to the employment with Wisconsin Michigan Power Company he was employed
4307 for a number of years by The Milwaukee Railway & Light Company, predecessor to Wisconsin Electric Power Company.

He entered the employment of Wisconsin Michigan Power Company on September 1, 1923, as mechanical engineer. I recollect very distinctly that Mr. Schubert was one of the principal assistants coming along under former John Anderson, chief engineer of power plants of Wisconsin Electric Power Company.

You may know that Mr. Anderson's name looms large in the history of the development of powdered
4308 fuel and when it became necessary to remodel the boiler house of Wisconsin Michigan Power Company located at Appleton, Mr. Schubert was wholly detached from the Milwaukee power plant organization and sent up to Appleton to see through the complete reconstruction of the boiler room at that place for powdered fuel operations, and he did a very fine job

of it, so well, as a matter of fact, that he stayed there and on December 7, 1932, he was appointed assistant general manager of the company, on February 21,

1936 general manager, and on March 31, 1939, he was elected to his present position of vice president and general manager of the company.

Bill Schubert can be described as another Wisconsin product, having been born in Milwaukee and educated at the University of Wisconsin, and he has worked in the employ of the companies for approximately twenty-one years.

Q. What are the functions of the Board of Directors of Wisconsin Michigan Power Company? A. As in the case of 4310
Wisconsin Gas & Electric Company, the Board of Directors of Wisconsin Michigan Power Company has only seven members; it has no excutive committee.

The Board of Directors normally meets monthly and all of the various problems which I described as coming before the Executive Committee of Wisconsin Electric Power Company come before the full board of Wisconsin Michigan Power Company.

The absence of an executive committee of this relatively small company is probably made good by the frequent visits of the chief operating officer to Milwaukee and as a matter 4311
of fact, by visits of the Milwaukee officers to the property where important matters are discussed.

Just recently I recollect that Mr. Way took a trip, in fact, with Mr. Shea of the North American Company, who came out to look over the properties. They went quite

thoroughly over the properties of Wisconsin Michigan Power Company as well as the others and were particularly interested in going up to the Narrows Dam, where a storage

reservoir is in process of construction on the Michigamme River.

Perhaps Mr. Schmidtman has described the Narrows Dam. I am sure that the frequent conferences which the so-called general executive officers of Wisconsin Michigan Power Company have at Milwaukee and on the property in Appleton and elsewhere, effectively takes the place of the more formal meetings which the larger company, Wisconsin Electric Power Company, finds it convenient to have in the
4313 form of its Executive Committee.

Q. The Board of Directors of Wisconsin Michigan Power Company actively directs its management of the business? A. Yes, the Board of Directors does actively direct the management of the business in all its phases and all of the directors are rather intimately in contact with the affairs. All of them are in extremely intimate contact and I know that Mr. Sealy, who lives in the east, receives frequent reports of operation and is also familiar with the properties.

Q. Who are the general executive officers of the company? A. The general executive officers of Wisconsin Michigan
4314 Power Company are Mr. Way, Mr. Van Derzee, Mr. Seybold and Mr. Schubert. The first three are also general executive officers of Wisconsin Gas & Electric Company and the first two are general executive officers of Wisconsin Electric Power Company. —1,923—

Messrs. Way, Van Derzee and Seybold are in general contact with the business and Mr. Schubert, in the capacity of vice president and general manager, has the portfolio of being in charge of general operations of all kinds.

He is the local man that really directs the operations of the company under the general direction of the Board of

Directors and in conference with the other general executive officers.

He lives at Appleton in the service area and I know of no other operating officer that has the intimate details of the operation of the business so close to his fingertips as Mr. Schubert.

He is a prodigious traveler. He is at one end of the property one day and the other end of it the next. He watches production very carefully. He is able to do so because of his training. He has able men taking care of sales work and 4316
other divisions of the business, but he, himself, has a good working knowledge of all phases of the utility industry.

Mr. Schubert is not restricted in any way. He has full authority to deal with and does deal with all matters in the territory which relate to the maintenance of service expected by the public. That means, in other words, in all things in which the customers are really interested.

Q. Will you describe for us the operating staff of Wisconsin Michigan Power Company? A. Wisconsin Michigan
—1,924—
Power Company is a somewhat smaller company than the 4317
other two. It has 443 employees. Under Mr. Schubert is an assistant general manager, Mr. M. G. Gorrow. Mr. Gorrow, as the title indicates, has authority under Mr. Schubert to carry on fully in his absence, and he assists him in all operations when he is present.

Mr. Gorrow lives in Appleton. He is forty-three years old and he has been with the company for twenty-three years. He is a very capable operator. One of the largest aggregations of employees in any division of the company is in the

so-called Southern Division which has 207 employees under the direction of Mr. F. E. Volkman.

Mr. Volkman lives in Appleton. He is forty-two years old and he has been with the company for thirteen years. He is the manager of the Southern Division.

He is in direct charge of the electric, gas and transpcrtation operations in the Southern Division.

There is also the Northern Division with 128 employees under the direction of Mr. L. W. Wyss. Mr. Wyss is an old-
4319 time employee of the company. He lives at Iron Mountain, Michigan, which is the operating headquarters of the Northern Division.

He is forty-four years old and has been with the company for twenty-three years and he operates as the manager of the Northern Division in direct charge of electric operations in

—1,925—

that division.

There are no gas or transportation properties in the Northern Division. In other words, he has complete charge
4320 of the operations of the company in the Northern Division.

That Northern Division, as you may have been told by Mr. Schmidtman, includes the territory of the company in Michigan and a small amount of territory just south of the north boundary of Wisconsin.

In charge of purchasing and stores, is Mr. H. H. Damm. Mr. Damm lives in Appleton. He is thirty-nine years old and he has been with the company for twenty years. He is the purchasing agent in charge of purchasing and stores with five people under him.

4321

I have not heretofore mentioned individual officers other than those discussed as general executive officers and the first assistant. These additional officers are secretary and treasurer F. J. Boehm, whom you will recognize is secretary and treasurer of Wisconsin Gas & Electric Company and Wisconsin Electric Power Company.

With this particular company, he has been secretary and treasurer for fifteen years. The assistant secretary and assistant treasurer, Mr. A. J. Bohl, who also has similar positions with the other named companies, has been in those 4322
positions for twelve years with Wisconsin Michigan Power Company and Mr. LaPorte, as assistant secretary and assistant treasurer, has been with the company for four years

—1,926—

in those capacities.

We have previously mentioned Mr. Johansen and he has been in the capacity of assistant secretary and assistant treasurer at New York for four years.

We have also Mr. L. R. Gresenz, who is assistant secretary and assistant treasurer. Mr. Gresenz lives in Appleton. 4323
He is forty-four years old and he has been with the company for twenty-five years and he is in charge of corporate records, collections, securities, insurance reports and accounting procedure.

He is very ably assisted by another assistant secretary and assistant treasurer, L. E. Hellenbeck, and the "L." stands for Linda. Linda is a lady. Miss Hellenbeck resides at Appleton and has been there for many years. She is forty-seven years old and has been with the company for twenty-seven of those forty-seven years.

She is specifically in charge of accounting, payroll and auditing and with Mr. Gresenz, constitutes the supervision over the character of activities indicated, with twenty-eight people under their supervision.

We have a chief engineer with twenty-five employees, by the name of C. E. Harger. Mr. Harger lives in Appleton. He is sixty-one years old and has been with the company for twenty-seven years, now chief engineer in charge of engineering, plant records, Southern Division plant operation
4325 and property accounting.

—1,927—

As I recollect the situation, Mr. Harger, and I am certain of this, came with us from the Peninsula Power Company, which we acquired back some fifteen years ago.

Assisting Mr. Harger is Mr. J. S. Wells, as assistant chief engineer. Mr. Wells lives in Appleton, has been with the company for fourteen years and is thirty-eight years old.

Mr. C. E. Schaefer, is an executive assistant with various duties common to that type of operation. He is particu-
4326 larly interested in personnel relations and labor relations and does a good job at it.

Mr. Schaefer is a resident of Appleton, age thirty-eight and has been with the company for twelve years. He also does some work in connection with the operating budgets of the company.

We have in the person of Mr. R. E. Williams, I think, one of the very effective promotion-of-business managers. Mr. Williams has charge of new business and merchandising and advertising with twenty-seven employees under him.

He has made a quite remarkable record in increasing the sales of residence and rural service in the communities served. Mr. Williams, although he does considerable traveling around the territory, lives in Appleton. He is thirty-eight years old and has had eight years of service with the company.

Q. What is the total number of employees of the company? A. I previously gave that at 443. —1,928—

Q. And what is the average length of service of the officers and staff heads? A. The officers and staff heads, whom 4328
I have just described in some detail for Wisconsin Michigan Power Company, average a length of service with the company, disregarding the companies that were predecessors to any portions of it, of 15½ years.

The Examiner: We will recess until 1:30.

(Whereupon, at 12:20 o'clock p. m., the hearing was recessed until 1:30 o'clock p. m. the same day.) —1,929—

4329

4330

AFTERNOON SESSION

(Whereupon, at 1:30 o'clock p. m., the hearing reconvened.)

The Examiner: The hearing will come to order. Are you going to start the cross examination?

Mr. O'Dell: Yes, sir.

The Examiner: Do you have any further direct examination?

4331 Mr. Hamilton: No, sir.

Whereupon, EDWARD H. SCHMIDTMAN having been previously sworn, resumed the stand and testified further as follows:

Cross Examination by Mr. O'Dell:

Q. Mr. Schmidtman, I think you testified before that you were a member of the operating research bureau which was run by the Wisconsin Electric Power Company for the benefit

4332 of all three companies? A. Yes, sir, I did.

Q. How are the charges and expenses of this bureau allocated among the three companies? A. All of the people employed in the bureau except the department head and the principal assistants are entirely on the payroll of Wisconsin Electric Power Company. A portion of salaries of the department head and the principal assistants are paid by Wisconsin Gas & Electric Company and Wisconsin Michigan

Power Company. When work is done in the department for either of the other two companies or for The Milwaukee

Electric Railway & Transport Company, the direct labor spent on that work is billed to the companies for which the work was done at cost.

There is no element of profit involved, but the total charges involved in doing the work are charged to the company for which the work was done

Q. This charge that is made to the individual company for whom the investigation is made, does that also include a portion of office expenses and general overhead expenses? A. Yes, that is correct. 4334

Q. I believe you also testified that the book value before depreciation of the properties of the three companies was $140,315,000.00? A. $140,315,612.00.

Q. How are those book values arrived at? A. Those are the figures carried in the books of the three companies for electric plant in service as of the end of 1939.

Mr. Browning: End of what?

The Witness: 1939.

(Discussion off the record.)

4335

By Mr. Maxwell:

Q. What is the basis for these costs? Does it constitute an original value set by the Wisconsin Commission at some

—1,931—

previous date to which has been added net additions? A. They represent the book value of the properties as indicated on the books of the companies. These figures include some items which represent differences between the recorded cost of the properties and the results of valuations made at different times for the different companies.

and valuation was made in 1914. The result of that valuation differed somewhat from the figure carried on the books of the company as fixed capital at that time.

The figures which I have given as book value do not reflect that difference between the appraisal and the recorded investment in property up to that time.

I testified that these figures were book value and we distinguished that figure from the figure carried in our property record which I spoke of yesterday, which property rec-
4337 ord figures are based on valuations plus additions and minus removals to date.

By Mr. O'Dell:

Q. Which is the higher figure—the book value figure? A. The book value is slightly higher than the property record figure. I don't have the exact differences in mind and the material I have here doesn't give those differences.

Q. Mr. Schmidtman, do you know of any arrangements for interchange of power where there is not common ownership? A. Could you expand the question a little? I don't
4338 —1,932—
believe I understand what you mean.

Mr. O'Dell: Read the question again.

(Whereupon, the pending question was read by the reporter.)

The Witness: Do you mean——

By Mr. O'Dell:

Q. (Interposing) I could expand that a little more. Do you know of any arrangements between a number of com-

panies operating in areas fairly close to each other where these companies are not owned by one company? A. Yes, I know of such arrangements. Do you mean arrangements in which one of our companies interchanges energy with a non-affiliated company?

Q. First, I will ask you if companies other than any of your own companies are involved in such arrangements? A. From my work in connection with the survey of power facilities in the State of Wisconsin, I know of places on the map where the transmission systems of non-affiliated com- 4340
panies make interchanges. As to the details of the interchange of power at those points, I am not informed.

Q. Do you know what companies are involved? A. I know of an interconnection between Northern States Power Company and Wisconsin Hydro electric Company and of an interconnection between Lake Superior District Power Company and a small system operating in the northwest portion of the State of Wisconsin. There may be other interconnec-

—1,933—

tions that I can't call to mind at the moment.

A number of the interconnections which we considered in 4341
the power survey of the State of Wisconsin were between operating companies belonging to the same holding company organizations.

Q. Do you know of the interchange of power agreement which exists between Commonwealth Edison Company and the Public Service Company of Northern Illinois, Northern Indiana Public Service Company, and Western United Gas & Electric Company? A. No, I am not familiar with those interconnections.

4342

Q. Are you familiar with the interchange of power arrangement between Pennsylvania Power & Light Company, Public Service Company of New Jersey, Philadelphia Electric Company and the Safe Harbor Hydro Station on the Susquehanna River? A. No, I know nothing of those interconnections. I have had no occasion to work with them or study them.

(Discussion off the record.)

4343

By Mr. O'Dell:

Q. Are you familiar with the Baltimore connection with the Potomac Electric Power Company? A. I have been told that such an interconnection exists and I have heard of it, but beyond that I can't give any information on it. I know nothing of how it operates or what amounts of power are interchanged or what the rates are.

Q. What is the general function of these interchange of

—1,934—

power agreements? A. Of these that you have mentioned?

4344

Q. Yes. A. I don't know. I am not familiar with the interconnections and don't know for what purpose they were established or what functions they perform.

Q. I am afraid you misunderstood my question. I wasn't referring to the three specific agreements I mentioned, but generally speaking, what function do these interchange of power agreements serve? A. Generalizing, I believe it can be said that interconnections between the transmission systems of different utility companies are effected for the purpose of carrying out advantageous interchange of power

under the circumstances under which the companies involved in the interconnection are operating.

One can not speak specifically of the purposes of any interconnection without knowing exactly the circumstances under which that interconnection was established.

Interconnections differ widely from each other with respect to function and extent of interchange and various other aspects.

(Discussion off the record.) 4346

(Witness temporarily excused.)

—1,935—

Whereupon, GOULD W. VAN DERZEE having been previously sworn, resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

Q. I believe you testified yesterday, Mr. Van Derzee, that good employee relationships was one of the subjects which constantly occupied your attention and that of the three companies, is that correct? A. Yes. I previously testified to the importance of good public relations as viewed by the general executive officers of Wisconsin Electric Power Company. 4347

It happens that three of the general executive officers of Wisconsin Gas & Electric Company and also of Wisconsin Michigan Power Company are also officers of Wisconsin Electric Power Company, so it is quite natural that the policies of Wisconsin Gas & Electric Company and Wiscon-

4348 sin Michigan Power Company with respect to the importance of employee relations should be identical.

For a great many years, the managements of these companies have followed a policy of maintaining good public relations and employee relations. The two go together. At an early date, it was recognized that good reliable service at low cost could be rendered only by employees who were satisfied with their working conditions and the general

—1,936—

4349 treatment accorded.

Most of the occupations found in the business grow steadily more important and more specialized and this has increased the value of experience and has placed increasing importance on keeping employees in service for long periods.

A few of the instrumentalities for maintaining good employee relations will now be described.

One of these is the Employees' Mutual Benefit Association, which we believe has improved employee relations materially.

4350 On February 28, 1912, this organization, namely, the Employees' Mutual Benefit Association, was formed among the employees of The Milwaukee Electric Railway & Light Company, Milwaukee Light, Heat & Traction Company and its associated and subsidiary companies.

It was organized originally to provide a mutual benefit society and an organization to administer a newly created loan fund. The benefit society aspects of it were the more important.

The loan fund related primarily to the amount of money which the company arbitrarily decided to set up and to loan

without interest to any needy employees who needed to take care of a doctor bill or an overdue coal bill or some such purpose as that.

Its purpose also was to create a fund to provide medical assistance for members, to pay disability and death benefits and to foster and promote a spirit of good fellowship among the employees of the company.

—1,937—

The benefits originally provided for sick benefit purposes were $1.00 a day when sick, a death benefit of $300.00 and 4352
free medical service for members. Now, that term "free" is probably not entirely correct because each member, in order to gain these services which he could have if he wanted, or not take if he didn't want, had to pay $1.00 plus 50 cents a month. $1.00 was a fee which was paid just once.

All employees of the companies were eligible to participate. For that 50 cents, the employee received at that time really expert medical attention. A very interesting thing in connection with the organization of the Employee's Mutual Benefit Association is the fact that it was devised and actually fostered and placed in operation by the president of 4353
the North American Company.

I don't think there has been any one thing that has been so far-reaching, not only for the welfare of the employees, but for the benefit of the company, than the establishment of Employees' Mutual Benefit Association at that time.

In the year 1918, the membership had grown to a point where it included most of the employees of The Milwaukee Electric Railway & Light Company as well as many of the employees of Wisconsin Gas & Electric Company and other affiliates.

4354 *Gould W. Van Derzee—By Respondents—Direct*

The benefits offered had been expanded materially and in addition the association had undertaken a new venture, name-

—1,938—

ly employee representation and collective bargaining.

The latter activity and increased costs of providing a greatly expanded program of benefits necessitated the support of all of the employees.

In the year 1918, membership was made a condition of employment. What happened at that time was really some-

4355 thing like this: The Company said to the Association, "You do all the employing; you provide all the people that are going to work for the company; you see that they are given educational facilities, that they are selected properly. Make one of the conditions of employment that they must belong to the Association" and that was the arrangement that was finally voted by the E. M. B. A. and a contract was entered into between the company and what I call E. M. B. A. for short, meaning the Employees' Mutual Benefit Association.

(Discussion off the record.)

4356 A. (Continuing) The contract which was entered into between the company and E. M. B. A. was known as a general labor contract and it constituted E. M. B. A. as the employing agent for the company.

That, of course, doesn't mean that E. M. B. A. could employ any type of person that was distasteful to the company and which it did not need. It meant that it was the employment manager and operated the employment office and pursuant to requisitions for employees needed by the company to the E. M. B. A., the E. M. B. A. employment office

—1,939—

proceeded to employ those people pursuant to predetermined specifications.

The general labor contract provided in addition that every group of fifty employees could be represented in collective bargaining with the management and that was one of the first instances that I know of in which a public utility entered into collective bargaining which really became quite general in 1934. In the year 1934, employee representation and collective bargaining activities of the Employees' Mutual Benefit Association were discontinued. 4358

(Discussion off the record.)

A. (Continuing) The so-called general labor contract was entered into in 1918 and as a result of suggestions of the North American Company. As the Association now stands, it provides social and recreational programs, together with the following benefits:

Death benefit of $300.00; a sick benefit of $1.00 a day; hospital benefits of $2.00 per day for room and board and an allowance of $20.00 per case up to a maximum of $40.00 in one year toward additional hospital charge; free medical services to members and dependents including X-ray and pathological services and dental services at cost. 4359

The Association also carries on relief and welfare work among members and former members. Membership dues are now 75 cents a month. This amount is matched by an equal contribution on the part of the companies for the members

which are employees of such companies.

4360 *Edward H. Schmidtman—By Respondents—Cross*

The Examiner: We will finish with Mr. Schmidtman now.

Whereupon, EDWARD H. SCHMIDTMAN having been previously sworn, resumed the stand and testified further as follows:

Cross Examination by Mr. O'Dell (Continued):

4361 Q. The Wisconsin Gas & Electric Company and Wisconsin Electric Power Company have similar types of demand? A. Yes, generally they have. There is some variation in the time of occurrence of their annual peaks, but they both serve somewhat the same type of territory, although the industrial component of the load served by Wisconsin Electric Power Company is substantially greater than that of the load served by Wisconsin Gas & Electric Company.

As a result of this slight difference there is some diversity between the time of occurrence of the annual peaks on the systems of the two companies.

4362 Q. I believe, Mr. Schmidtman, that you had previously testified that the loads of the two companies fitted together. A. Yes, they do. Now, perhaps I should elaborate on what I just said. You will notice from my testimony that Wisconsin Gas & Electric Company serves a much larger rural area than does Wisconsin Electric Power Company and a

—1,941—

much larger number of rural customers.

The characteristics of that load naturally have some influence on the characteristics of the load of the system of Wisconsin Gas & Electric Company as a whole and the com-

bining of the load of that company with the load of Wisconsin Electric Power Company results in a composite system load which has a higher load factor than would have the loads carried by either system alone.

It would be most unusual for two systems serving types of loads with the differences I have just pointed out and not have a composite load of much more desirable characteristics than those of each one of the individual parts.

Q. Could the present interconnections between the three companies continue just as usefully and economically if the three companies were not subsidiaries of the North American Company? 4364

Mr. Browning: Just a moment. Could that question be clarified as to whether you mean that the three companies would be completely independent of each other? Do you mean that the three companies would be subsidiaries of some other holding company or that the three companies would be severed from each other?

Mr. O'Dell: I believe I will clarify it to the extent of saying that if the three companies were completely independent of each other. 4365

—1,942—

The Witness: No. The interchange or interconnection arrangements between the three companies would not continue to operate as they operate at present without the community of interests that exists between the companies.

4366 *By Mr. O'Dell:*

Q. Would you say that certain economies would be lost without this community of interest? A. Certain economies would be lost because the type of operation without the common interest would be changed. I can illustrate that——

Q. (Interposing) All right, go ahead. A. (Continuing) —very specifically, that in the interchange of power between the Wisconsin Michigan Power Company and the
4367 Wisconsin Electric Power Company, there are times of the year when Wisconsin Michigan Power Company is delivering large quantities of surplus hydro-electric energy into the system of Wisconsin Electric Power Company.

I have explained that the purchase of that surplus hydro-electric power results in economies to Wisconsin Electric Power Company as well as to Wisconsin Michigan Power Company, but the advantages to Wisconsin Electric Power Company are not of uniform magnitude throughout the periods of delivery of that energy.

At certain times during the periods of delivery, the loads
4368 on the steam power plants of Wisconsin Electric Power Company are lowered to such a point that those plants are

operating at greatly reduced efficiencies.

If it were not for the fact that the Wisconsin Electric Power Company and Wisconsin Michigan Power Company were operating in effect as one company, Wisconsin Electric Power Company would not be willing to take that surplus hydro-electric energy in such quantities as to cause such great reductions in steam generating efficiency.

4369

The receipt of such power would be reduced by Wisconsin Electric Power Company. The delivery of that power by Wisconsin Michigan Power Company would correspondingly be reduced and the water used in generating the energy which would be discontinued at that time, would be spilled over the dam and the electricity represented in that water would be lost.

Wisconsin Electric Power Company could, at certain times, realize some economies by not accepting that surplus hydro-electric power and would, therefore, improve its own 4370
position to some extent, but that improvement would not be as great as the loss to Wisconsin Michigan Power Company through not being able to generate that electricity and sell it.

The net effect under such circumstances would be an economic loss, as applied to the entire interchange arrangement. That is, the one company would lose more than the other company would gain.

Mr. Browning: Read that last.

—1,944—

(Whereupon, the answer as above recorded was read by the reporter.) 4371

The Witness: By the one company, I refer to Wisconsin Michigan Power Company and by the other company I refer to Wisconsin Electric Power Company.

By Mr. O'Dell:

Q. I just want to clear something up from what you have just said. Is the effect of this interconnection between Wisconsin Michigan Power Company and Wisconsin Electric

4372 Power Company one where the Wisconsin Electric Power Company suffers by this interconnection? A. In total, no. There are times when the surplus hydro-electric energy delivered to Wisconsin Electric Power Company can be taken into the power supply of that company advantageously, but, as I have explained, the advantages of taking that power into the system of Wisconsin Electric Power Company do not run uniformly throughout the year.

4373 At times, the advantage is great, at times it is small, but it isn't a question, as the interconnection now operates, of whether Wisconsin Electric Power Company is making money or not, as long as both companies together are gaining benefit.

So, at the times when the load on the system of Wisconsin Electric Power Company is low, during the high flow season, in the early morning hours, for instance, and particularly during certain hours on Saturdays and Sundays, the loads on the steam plants of Wisconsin Electric Power Company

—1,945—

4374 fall to most uneconomic levels because the company is taking into its system those large quantities of surplus hydro-electric energy from the north.

At other hours of the day, when the loads on the system of Wisconsin Electric Power Company are higher and there is sufficient demand to load up the units in operation to efficient loads, and at the same time utilize this surplus hydro-electric energy, then the receipt of that energy is beneficial to Wisconsin Electric Power Company to an appreciable extent.

What I am trying to make clear is that the advantage of using that surplus hydro-electric energy varies in accordance

with load conditions on the system of the receiving company. If those companies had no common interest and each was looking out entirely for its own interest, the company receiving that surplus hydro-electric energy would take it only when, as and if it wanted it regardless of whether the other company was spilling water and was urgently in need of a market for such energy.

Under the present arrangements, the energy is generated and a market is found for it in order to make use of the natural resource available in that falling water. 4376

Q. I believe you stated that in 1935, interconnection with the Public Service of Northern Illinois was discontinued. A. Yes, I did state that.

—1,946—

Q. Why was it discontinued? A. It was discontinued at the insistence of Public Service Company of Northern Illinois.

Q. Do you know what their reasons were?

Mr. Hamilton: I don't know whether the witness is competent to testify as to what may have gone on in the minds of the officers—— 4377

The Examiner: (Interposing) He just asked him if he knows.

Mr. O'Dell: If he doesn't know he can say so.

Mr. Hamilton: All right.

The Witness: I understand by hearsay that the reason was that that company did not wish to engage in interstate commerce.

4378 *By Miss Calkins:*

Q. Mr. Schmidtman, on your direct examination, did you describe all of the inter-company servicing which exists between the Wisconsin-Michigan group of properties which your direct testimony covered? A. Probably not. I intended to describe the principal ones and it is entirely possible—in fact, it is entirely probable—that there are other inter-company relationships involving the joint use of property or the joint use of personnel which I didn't cover.

4379

Mr. Browning: If I may interject there, Miss Calkins, we are going to put in a great deal of additional testimony on that topic.

—1,947—

Miss Calkins: Will the additional testimony also cover the method of allocating charges for all this servicing? Mr. Schmidtman barely touched on that in connection with some joint offices of Wisconsin Gas & Electric and Wisconsin Electric Power.

4380 *By Miss Calkins:*

Q. I believe that was covered in your testimony? A. Yes.

Q. And this research department was paid for by all the different companies to maintain the research department of the company with which you are connected?

(Discussion off the record.)

Miss Calkins: I only want to get this straight. Some place in this record, either at the present time or on cross examination of Mr. Schmidtman, or on the

direct testimony of other witnesses, or their cross examination, I want this record to show a complete description of the inter-company servicing and the method of allocating the costs of that servicing among the various companies.

Now, if that will be a little bit later, I won't examine Mr. Schmidtman on it.

Mr. Hamilton: I think the record will show that in almost every instance, at least which I have in mind at the moment, the statement was made that 4382
that was paid for at cost.

Miss Calkins: The method of determining that cost is another question.

—1,948—

(Discussion off the record.)

By Miss Calkins:

Q. Mr. Schmidtman, are you familiar with the method of allocating the costs of maintaining the joint offices of Wisconsin Gas & Electric Company and Wisconsin Electric 4383
Power Company? A. That is right.

Q. Which you have previously referred to in your direct testimony? A. Yes, I am familiar with those matters.

Q. Will you state the method of allocating the costs? A. The joint offices to which you refer are those located in Racine where Wisconsin Gas & Electric Company and Wisconsin Electric Power Company share the office buildings owned by Wisconsin Gas & Electric Company and make joint use of office facilities owned by that company and of personnel on the payrolls of both companies.

4384 *Edward H. Schmidtman—By Respondents—Cross*

Each year a survey is made of the use of floor space and of office facilities and of office personnel in carrying out the operations which are performed jointly by the companies in these offices.

The work performed by each individual who is doing work jointly for the two companies is studied to determine how much of his output is devoted to the service of each company, and the salary of the individual is divided between the two companies on a percentage based on that division

4385 —1,949—

of work.

In the case of floor space, measurements are made to determine how many square feet of floor space on each of the floors of each of the buildings, of which there are three, is used by each company.

The investment in each building is taken into account to determine proper fixed charges on each of the properties. Those fixed charges are divided between the various floors in proportion to the value of those floors for the purposes for which they are used and the floor space on each floor

4386 is then assigned to each of the companies in accordance with the space actually utilized by each.

From those figures, the rental for land and buildings is computed as of conditions obtaining at the end of October in each year.

The wages are divided, as I have indicated, on the basis of output of the people. That can be illustrated by taking a billing clerk as an example. The billing clerks make out the bills for the electric and gas service of Wisconsin Gas & Electric Company and for the electric service of Wisconsin Electric Power Company.

The number of bills produced by each clerk for each of the companies furnishes the basis for dividing the wages of that clerk between the two companies.

Q. Is that for the previous year or for the forthcoming

—1,950—

year at the time that survey is made? A. The survey is made at the end of October, covering use of floor space and facilities at that time, but the division of payroll is based upon the previous month's output of the personnel involved in the joint operations. 4388

Q. So there is a reallocation of the payroll every thirty days? A. No; the division of payroll and of rental that is worked out at the end of October becomes effective on the first of January next succeeding and remains in effect for the following calendar year.

The period between October 31 and January 1 is allowed in order to give sufficient time to make the survey and make all the computations and complete the report.

Q. There is a reallocation yearly? A. An annual reallocation of those charges, yes.

Q. And each company pays for the forthcoming year 4389 on the basis of the work done for the prior year and over a period of years that is supposed to balance things, is that correct? A. Yes, that is correct. The basis of allocation for any calendar year is the report prepared as of October 31 of the preceding year.

Q. Then, is every individual jointly employed by those two companies paid on that same basis? I mean, does that method apply to everyone of the joint employees? A. That

—1,951—

4390 *Edward H. Schmidtman—By Respondents—Cross*

method applies to everyone of the joint employees working in the Racine offices.

There are other joint employees in sales work who are not included in this arrangement and whose wages are divided between the companies on the basis of direct hours devoted to the work of each of the companies.

Q. Is there any general overhead which has to be allocated? A. In the case of the wage and rental agreement, there is no general overhead because the agreement—and by
4391 the wage and rental agreement, I refer to the annual revision of the division of wages and rent for the Racine offices —that agreement is made in sufficient detail to cover all components of cost involved in the joint operations.

It includes the salaries of all people as far up as the Racine Division manager, who devotes a part of his time to the electric operations of Wisconsin Electric Power Company and to the electric and gas operations of Wisconsin Gas & Electric Company.

The rental for buildings includes no item referred to as general overhead because it includes fixed charges directly
4392 and it includes all expenses of operating and maintaining the buildings as direct operating expense.

Those components of operating expense are included as a part of the amounts paid under the name of rental for buildings.

—1,952—

Q. Is this inter-company arrangement, of which we have just spoken, under the jurisdiction or supervision of the local Commission there? A. Under the jurisdiction of the Wisconsin Public Service Commission.

4393

Miss Calkins: I think that is all.

The Witness: The general contract under which this joint use is made of facilities and personnel, is filed with the Public Service Commission of Wisconsin and the filing states the basis under which the arrangement operates and also states that it is revised annually on the basis I have just described.

By Miss Calkins:

4394

Q. There is no possible profit to either of the participating companies that would arise by virtue of that? A. No, there is no possible profit. In fact, the agreement is worked out each year by the operating research bureau. The labor devoted to the investigation and preparation of the report is divided equally between the companies on an hourly basis After the report has been finished, it is submitted to the officers of Wisconsin Gas & Electric Company for approval before being made effective.

Their auditors check over the report in detail and the rentals set forth in the revision are made effective only upon approval by both companies.

4395

Q. Do these joint employees get two checks then? A. No.

—1,953—

The joint employees are paid by one company or the other, but a monthly billing is made by Wisconsin Gas & Electric Company to Wisconsin Electric Power Company because the latter company makes use of more personnel and facilities of the former than does Wisconsin Gas of Wisconsin Electric Power Company.

The net amount due Wisconsin Gas & Electric Company is billed monthly to Wisconsin Electric Power Company and

is paid. Some of the employees who do work for both companies are on the payroll of Wisconsin Gas & Electric Company and some are on the payroll of Wisconsin Electric Power Company, but, as I say, the buildings belong to Wisconsin Gas & Electric Company and more of the joint personnel are on the payroll of that company, so the monthly payments go to that company.

Miss Caikins: I think that is all.

4397 We would like to reserve the right to recall Mr. Schmidtman if it becomes necessary at any later time in the proceedings.

Mr. Hamilton: We understand that it isn't necessary for us to note our objection to that procedure.

The Examiner: Yes, I think our understanding is clear, but I think this witness here ought to be fully cross examined. This company ought not to be required to bring him back at its expense.

(Discussion off the record.)

—1,954—

4398

Redirect Examination by Mr. Browning:

Q. Mr. Schmidtman, you were cross examined about the benefits resulting to Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company, from their inter-company purchases of power. Do I understand correctly that in making the arrangements which have been made you consider the three companies as one and that the operations are for the benefit of the entire group? A. Yes. That was the basis for the

entire arrangements for the interchange of power between the companies of the group.

Q. Counsel asked you whether there were "certain economies" due to the close association of the companies and you replied that there were certain economies. Are those economies small or substantial? A. They are substantial.

Q. Would there be a large loss if the three companies were severed? A. Yes, that loss would be large. It would be difficult to estimate it in so many dollars, but it would be an 4400
appreciable amount because, as I have explained, the nature of the operations of the companies has been based entirely on the assumption that they have a common interest and so far as power production and transmission is concerned, they operate as one system.

—1,955—

Mr. Browning: That is all.

The Examiner: Anything further, Mr. O'Dell?

Mr. O'Dell: Do you mind reading Mr. Browning's last question and the answer, Mr. Reporter?

(Whereupon, the last question and answer 4401
above recorded was read by the reporter.)

Recross Examination by Mr. O'Dell:

Q. When Mr. Browning used the word "severed" in his question, did you take that to mean that the three companies are no longer being subsidiaries of The North American Company? A. I understood him to mean that the three companies would no longer be subsidiaries of any one company.

4402 The Witness: Is that what you meant, Mr. Browning?

Mr. Browning: Yes. That is, I meant that they would no longer be under common ownership.

By Mr. O'Dell:

Q. Don't you think that regardless of whether these companies are under one common ownership or not, the economies that they have experienced to date through working
4403 together the way you have explained would be sufficient to cause them to continue with these same interconnections? A. No, I don't think that is true—definitely. I don't seem to have gotten the idea across that the benefits realized by the companies through their interconnected operations have re-

—1,956—

sulted from a basis of operation which is carried out in the interests of all three companies as a whole.

Because of this basis of operations, the economies realized by one company of the group, let us say, have been reduced somewhat by the consideration given to the welfare of the
4404 other companies, to the effect that the total over-all benefits will be a maximum.

If these companies did not have the common interest, which they have, and each one was looking out entirely for itself, they would be less willing to consider the welfare of the others than they have been.

The most concrete example I can give you is the one I have already given concerning the use of surplus hydro-electric energy by Wisconsin Electric Power.

Q. Yes, but didn't you state there that the advantages accruing to the Wisconsin Electric Power Company in peak

 4405

times exceeded the disadvantages that Wisconsin Electric Power Company might have suffered at times when demands on their system were not so great? A. Yes, I did and I am glad you put it that way.

Q. So that advantageous effect would always induce the company to go into these arrangements? A. No, you are not right there. The gross advantageous effect would be what the company would get if it were looking out for itself. It wouldn't except the loss during the low load periods that it

 4406

is now accepting in order to benefit Wisconsin Michigan Power Company.

Q. You stated though that the net effect between the two companies was one of advantage to the Wisconsin Electric Power Company? A. Yes, it is.

Mr. Hamilton: I think the witness has testified in his direct examination, and has given dollar figures to indicate the benefit to both Wisconsin Electric Power Company and to Wisconsin Michigan Power Company for the years 1938 and 1939.

4407

The Witness: I do want to make it clear though at this point that it is not logical to assume that inasmuch as both companies benefited from this arrangement and also inasmuch as the operations were carried on so that the joint benefit of both companies was a maximum, that each company received the greatest benefit it could have obtained had it not considered the welfare of the other.

Wisconsin Michigan Power Company received appreciably more benefit from this interchange because

4408 of the fact that Wisconsin Electric Power Company considered the interests of Wisconsin Michigan Power Company in taking off the hands of the latter company the surplus hydro-electric energy which it had at a time when Wisconsin Electric Power Company was not particularly anxious to use it.

—1,958—

By Mr. O'Dell:

4409 Q. Aren't there other situations as a result of this community of interest, where, we will say, Wisconsin Electric Power Company benefits perhaps at the expense, in a particular situation, at the expense of the Wisconsin Michigan Power Company? A. If you mean by benefiting at the expense of the other, the sale of service to the other at a reasonable price, the answer is yes. If you mean benefiting unfairly to the detriment of the other the answer is no.

Q. I don't mean to infer that there is any ultimate detriment to the company as a result of any sort of agreement be-
4410 tween the two companies. A. There is no question but what the arrangement is beneficial to all of the companies. That is the intent of the arrangement.

Q. My question originally was this: That in view of this arrangement, of the benefits that accrue to all of these companies because of the close relationship and the agreements, and so forth, that exist between the companies, wouldn't those things continue in effect without having all of these companies being subsidiaries of The North American Company? A. The answer is still no, definitely.

Q. Aren't these economies that these companies have experienced in the past sufficient to induce them to continue it

—1,959—

regardless of whether they are under common control or not? A. The net results would be different because under the type of operation that these companies carry on, one company is willing to accept less of a benefit in order that the total benefit realized by the group may be more.

If the group interests were not present as they are, that consideration would not enter into the arrangements. 4412

Mr. O'Dell: Mr. Examiner, I have no other questions.

The Examiner: All right. Have you anything further, Mr. Browning, or Mr. Hamilton?

Mr. Browning: No.

(Witness excused.)

(Discussion off the record.)

The Examiner: We will take a short recess.

(Whereupon, a short recess was taken.) 4413

Whereupon, GOULD W. VAN DERZEE having been previously sworn, resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

Q. Will you tell us about the Employees' Mutual Savings Building & Loan Association? A. I happened to have been the first president of that Association and I recollect quite

4414 distinctly some twenty-six years ago in 1914, going around

—1,960—

to the car stations in different locations of employees on the property, and telling them about the advantages of starting what was then called a Building & Loan Association; it was an idea that Edwin Gruhl had that he thought would be of great benefit to the employees of the company.

I remember he had a dummy of articles of incorporation worked up and an insignia on the back of it of a dollar sign
4415 that was made up of two letters, systematic savings. He really originated the idea and set us to work on the formation of the Association.

Q. Who was Mr. Gruhl? A. Edwin Gruhl was later president of The North American Company, but at that time, I believe the records will show, that he was assistant to the president or he might even have advanced to vice president. I can't remember. But he was one or the other.

The Association was finally established on March 28, 1914, and I remember very distinctly the qualms that I had
4416 of getting up and making a speech to a large body of employees with the president of The North American Company sitting in the front row.

They were very close to the property at that time, as they have been most of the time.

The Association was finally established under the banking laws of the State and it grew over the years to be the

—1,961—

second largest savings and loan association in the State of Wisconsin.

It has the unique record of never having to defer a demand on the part of a paid-up stockholder or instalment stockholder for withdrawal of funds.

It went entirely through the depression without stopping payment of any kind and paid dividends at a reasonable rate. It is highly regarded by the employees of the company as an investment medium.

I do not mean to indicate that it did not suffer some severe losses in the depression in the form of properties that had to be taken back and resold, but it had a better record 4418
because most of the membership was made up of employees and former employees.

On June 30, 1940, there were 6,687 stockholders who held a total of 134,711 shares of stock. On the same date, the Association held 1,617 mortgages most of which were on homes of employees or former employees.

In encouraging the establishment and growth of this institution, the management encouraged thrift and home ownership among employees as one of the aids in bettering employee relationships.

Q. What were the total assets of the Association on June 4419
30, 1940? A. $6,330,506.00.

Q. Now, will you tell us about the gain-sharing plans of

the companies? A. The term "gain-sharing" plan is used by our companies to mean what is popularly known as a bonus plan.

In 1911, the first wage incentive plans were put into the shops. Those plans were essentially a piece rate for machine operations. They were not particularly satisfactory. They

were followed by a premium plan in the shop which has been satisfactory.

About in 1913, someone got the idea that it would be a good thing to increase the number of bonus plans and apply them to almost every operation where the output could be measured and one of the early ones I recollect was in the meter reading department.

We made careful studies of the amount of time required to read meters, then we concluded that if the meters could
4421 be read accurately in less time by any individual on his route, that it would be proper to divide the net savings between the individual and the company 50-50 after subtracting some 20 per cent. of the net gain for administration of the plan and that generally is the basis that has been followed for a great many years.

We have very substantially reduced the cost of meter reading by that incentive plan.

A demand for bonus plans grew rapidly after the establishment of the first ones and in February, 1928, 84 per cent. of the employees of The Milwaukee Electric Railway
4422 & Light Company were participating in bonus plans and a

substantial number of employees in the Wisconsin Gas & Electric Company were working on similar plans.

On May 31, 1940, 70 per cent. of the employees of the Wisconsin Electric Company and 59 per cent. of the employees of Wisconsin Gas & Electric Company were participating in bonus plans.

On the same date, there were 175 bonus plans in operation in the two companies. Bonus earned by employees now ranges from about 3½ per cent. to 50 per cent. of their

guaranteed wages and their variation is due to differences in the ability of the employees, differences in supervision, and to many other conditions affecting the quantity or quality of the work done.

In the year 1939, bonus payments made to employees of Wisconsin Electric Power Company amounted to a large figure of $647,150.00 and that was in addition to their basic wages and was an average of about $320.00 per employee.

That has nothing to do with what is commonly known as a year-end payment made by some companies and called 4424
a Christmas bonus.

This is the result of meeting the standards of work which have been set by an amount, the value of which is divided between the company and the employee, after taking away 20 per cent. for administration.

Plans have been established on jobs of almost every de-
—1,964—
scription. The fundamental basis for the establishment of any of these plans may be either a time allowance for a specified routine operation, accuracy and quality of the work or a combination of both. 4425

I have given you an example of the basis for measurement of time plan; an example of a quality plan is the plan in effect for sub-station and power plant operators which provide that a certain bonus will be paid if controllable outages are reduced below a certain limit.

Additional bonus is paid on the plan if material and supplies consumed are below a certain amount, if costs of maintaining equipment are held below a certain figure and if errors on load sheets are reduced below a certain standard.

4426 Bonus plans operated in these companies have been some of the most successful ones developed, we believe, anywhere in the country and their success is attributable to the fact that they were developed only after a very careful study and were designed on sound principles.

They have been fair to the employees and have received their support. Probably Mr. Schmidtman had something to say in his testimony about these matters. But I recollect that in my statement of the different divisions of the oper-
4427 ating research bureau, that is one of the divisions that was devoted to the maintenance of these plans.

Obviously, you must keep right after them and if the condition changes by the introduction of a machine or you

—1,965—

decide to do something in a different manner, you must correct the plan promptly and intelligently.

Now, actually, we have an agreement with the unions with which we operate so that no changes are made in these plans unless they have the approval of the union and the department head of the company.

4428 There is a by-product of these plans that I want to discuss very briefly and that is one of the determination of unit costs. We have studied with time study men over and over again most every operation that is performed in carrying on the business of electric service.

It is natural that we get a very large collection of unit costs. Those unit costs, I think, have been very valuable to us in determining whether work is done effectively. They help us in estimating for one thing what the cost of future projects will be, where those projects are of a construction nature.

There is another by-product which isn't generally recognized and which may have something to do with what I believe to be the relatively low unit cost we have in many operations and that is when an employee knows that if he slackens work, if he does poor work, he is going to have something taken off of a component of his wage, he is likely to put forth his best effort in his own interest.

That, in a measure, tends to minimize the necessity for

—1,966—

supervision and if there is any one thing that these plans do, they tend in a measure to supply a certain degree of automatic supervision.

I don't want to leave the impression that you can establish a bonus plan and then tell the boys to go to work and supervisors can go home. They can't. You have to have proper and adequate supervision, but I think the amount of it is lessened because of the interest that the employee has from a dollars and cents standpoint in doing his best work.

So I think that these plans may be added very logically to the list of things that has tended to improve employee relations.

Q. Do you have any pension plans? A. In 1912, when the Employees' Mutual Benefit Association was formed, a pension plan was adopted for the employees of The Milwaukee Electric Railway & Light Company and The Milwaukee Light, Heat & Traction Company, as a part of its activity. The pension plan was established, naturally, for the purpose of providing a retirement income for employees who were beyond a certain age or incapacitated in service.

The plan provided pensions for employees of 60 years or older having fifteen years or more of service at that time,

4432

and there were disability pensions for employees under 60 having fifteen years or more of service.

The disability pension has to be approved by the medical

—1,967—

director and he has to assert that the man is incapable of further work and under those conditions he receives the same magnitude of pension that another man who is older would receive under similar basic conditions of wages, but only for a period of 14.1 years.

4433 From the beginning, the companies undertook to provide the money for the pensions and they have supported the plan down to the present time.

The original plan in 1912 made no definite provision for a trust fund, but in October, 1922, the agreement generally under which we are operating now was executed between the companies on the one hand, a trust company, and the E. M. B. A. on the other.

This provides for the company contributing to the pension fund as later modified, three-quarters of one per cent.
4434 of the operating revenues of the company, and the payment of pensions after certification by a pension board. At the present time, Wisconsin Electric Power Company and The Milwaukee Electric Railway & Transport Company have 275 pensioners and Wisconsin Gas & Electric Company has fifteen.

Wisconsin Michigan Power Company is a much younger company and so far hasn't felt the need for a pension system.

We have another association which we think is productive of good employee relations and that is the veterans

association. We think it has encouraged somewhat sustained employment.

—1,968—

On September 18, 1916, the veterans association was formed to provide an organization without dues for employees of The Milwaukee Railway & Light Company, Milwaukee Light, Heat and Traction Company, and their associated companies, for employees who had been continuously in service for a period of twenty years or more.

The veterans association embraces employees from all 4436
three companies. As a matter of fact, it embraces the employees of all four companies, but we are dealing here primarily with the electric utilities and the three companies that are referred to here are Wisconsin Electric Power Company, Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company.

Q. And the fourth company was a transport company? A. Yes. And on June 30, 1940, Wisconsin Electric Power Company had 417 veterans, Wisconsin Gas & Electric, 108, and Wisconsin Michigan Power Company, 46, a total of 571 employees of those three companies who, at that time, had 4437
been with the companies for twenty years or more.

It is a matter of fact that the employees of the transport company are generally older as they usually are in the older business of transportation, and there are over eight hundred veterans in that company, so that before the separation was made in October of the transportation and the electric business, we had somewhere between one out of four and one out of five employees of the old The Milwaukee Electric Railway & Light Company, who had been in the service of the com-

—1,969—

pany twenty years or more.

We have a special insignia that I have referred to once or twice as a double veterans' medal. That is really a very artistic thing that the veterans appreciate not so much from that standpoint as for what it really stands for and that is given when an employee has been in the service of the company for forty continuous years.

On June 20, 1940, there were nineteen double veterans in the three companies distributed as follows:

Wisconsin Electric Power Company, 14; Wisconsin Gas
4439 & Electric Company, 1; Wisconsin Michigan Power Company, 4.

Among those who have attained such a remarkable record of service are Mr. S. B. Way, president of the three companies; Mr. F. J. Boehm, secretary and treasurer; Mr. James D. Shaw, director and counsel for Wisconsin Electric Power Company. Although Mr. Way's service record, as described with respect to his being a director, shows only twenty-eight years with the company, he has had forty years with associated companies, namely, the predecessor of the Union Electric Light & Power Company where he worked before
4440 he was sent by The North American Company to come to Milwaukee.

Q. Have you other associations among employees? A. We have what is called the technical league. The technical league has dues of only 50 cents a month and the aims and

purposes of the technical league is to give to men and women employees who are so interested and want to learn more about the business, an opportunity to come to monthly meetings which are well arranged by the officers of the league and cover important developing factors in the business.

One of the by-products of this league is an arrangement under which prize papers are submitted by employees who have ideas on useful things that can be tried by the company, and they are given annual prizes for the best papers.

At a recent management staff meeting, the nature of which I described yesterday, we had over twenty-five of those papers which had just been submitted. The purpose of bringing them to the management staff meeting was to talk about them around the table and make certain that every idea that was good was to be adopted, and there were several ideas 4442
written by these men down the line which were very good and which are being adopted as standard practice.

We think there is great value in encouraging the development of ideas from the bottom up and in recognizing the production of those ideas suitably.

I have no doubt that the men who developed the ideas which were adopted by the company valued the fact that the staff had looked them over and adopted them much more than the fairly substantial money consideration that went with the winning of the prize.

4443

—1,971—

We have also what we call the Meral Club, which promotes fellowship among women employees. That name "Meral Club" is a hangover from the old Milwaukee Electric Railway & Light Company, M-e-r-a-l being the initials. They still retain the name, although it isn't applicable.

The Meral Club has monthly meetings of a social and educational nature. They have 301 members and a majority of them are office employees of the Wisconsin Electric Power Company.

We also have labor organizations and it would probably be proper to state here the nature of the labor organizations because we believe that the proper handling of labor matters goes a long way toward good employee relations.

We have the following labor groups which have been recognized as bargaining agents. Sometimes it is quite a task to keep all these negotiations on an even keel.

There are so many different ideas as to what constitutes what they should get by bargaining. We have the Amal-
4445 gamated Association of Street Railway & Motor Coach Employees of America, Local 998, representing certain employees of the purchasing and stores department of Wisconsin Electric Power Company, and the transportation employees of Wisconsin Gas & Electric Company.

If I were also discussing the transport company, I would say that this same organization represents the employees of that company.

—1,972—

We have the International Brotherhood of Electrical Workers, Local No. 494, representing electrical operating
4446 and maintenance workers of the three companies—that is, Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company, who operate in our service area.

There is the United Association of Office, Sales & Technical Employees, Local No. 2, representing office workers and miscellaneous employees of Wisconsin Electric Power Company in Milwaukee.

We have the Public Service Employees Union of Wisconsin, representing office workers of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company in Racine

and Kenosha. That is, it is primarily a Wisconsin Gas & Electric Company Labor Union, but extends to these employees.

—1,973—

We have the International Union of Operating Engineers, Local No. 317, representing the power plant operating and maintenance workers of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company.

Then we have the Gas and By-Products Coke Workers, Local No. 12,005, representing the gas workers of Wisconsin Gas & Electric Company, and, last, we have the Wisconsin 4448
Michigan Utility Operators Union, representing gas workers and office workers of Wisconsin Michigan Power Company.

I think I can say that, with the exception of workers above the grade of working foreman, all of the employees of our companies belong to some form of union—A. F. L. sponsored, one C. I. O.; and two or three independents.

A. F. L. sponsored, one C. I. O.; and two or three independents.

Although there are many problems to handle in connection with such a large number of unions, with very naturally different views on matters, we have been reasonably successful in showing them and having them agree that a certain degree of uniformity and basic labor philosophy, in its application to our group, is the thing. 4449

Various organizations and means discussed above have all contributed to good employee relations, and no doubt have been a big factor in the stabilization of employment.

In addition to this, we have always maintained a good wage standard and we have always tried to maintain a policy of fair dealing with our employees.

—1,974—

4450 I think the following tabulation, showing the approximate length of service of employees of these companies, is some evidence of results achieved, and I will give you just a few figures which can be readily taken down.

This refers to the number of regular employees of the companies:

In the three companies, the record shows that the length of service in years between zero and five years is such that 30 per cent. of employees are in that range.

4451 There are 12 per cent. of the employees in the range of six to ten years, 26 per cent. in the range eleven to fifteen years of service, eighteen per cent. who have been with us from sixteen to twenty years, and fourteen per cent. who have been with us over twenty years.

Mr. Browning: We will now take up all of the various companies in the group, and the different businesses in which they are engaged.

Of course, some of these companies, such as the three electric companies, have already been described
4452 in considerable detail, so that we need not go into the electric business at this point.

By Mr. Browning:

Q. Will you cover, briefly, Mr. Van Derzee, the companies which are included in the Wisconsin Michigan group of subsidiaries of The North American Company, indicating

briefly the nature of the business of each? A. Wisconsin Electric Power Company is engaged principally in the generation and transmission, distribution and sale of electrical

4453

energy, but it also engages in some other operations incidental to the rendering of electric service. It operates a steam heating utility.

The area served by Wisconsin Electric Power Company with steam heating is not large, and it includes only a section of downtown Milwaukee; at the end of June 1940, there were 968 steam customers.

At the same date, the Company owned 21.22 miles of steam mains.

4454

During the year 1939, to show you the magnitude of the system, there were sold 1,308,456,000 pounds of steam, from which sale the revenues derived were less than 2.7 per cent. of the total operating revenues of this company as compared with 2.9 per cent. in 1930.

Q. Are the heating operations of the Company valuable to the electric business? A. We believe that they are, and, to bring out the point, it may be advisable to review a little history about the developemnt of steam heating utilities.

The prime movers in the early days, which furnished the power for the electric generators, were principally re- 4455

—1,976—

ciprocating engines, and the exhaust steam from those old engines was usually sent out to the atmosphere.

Later, crude types of condensers were used to increase the economy, but electric utilities found that the exhaust steam could better be used in a steam heating system, and there was a real demand for that type of service.

After the service was established, many buildings were built in the downtown area, without any provisions for local heating, and consequently it was quite natural that the busi-

ness expanded, and that it took on some air of having public convenience and necessity.

The steam heating business is now operated by Wisconsin Electric Power Company, and it is a valuable adjunct to the electric operations.

There is a sales aspect in connection with this, that might be discussed at this time, and the nut of that is that, if customers in downtown buildings have a means of getting steam, they are less likely to generate their own electricity, while,
4457 if they do not have a means of getting purchased steam, they have to put in boilers anyway, and they can merely enlarge the boilers and buy an engine and generate their own electricity. While they may not have been what was in the minds of the original promoters of a steam heating distribution system, it very decidedly is a means of keeping the electric business in the downtown area now.

—1,977—

Q. Have you any new developments in steam turbines, which have coordinated the steam heating and electric operations of the Company? A. Yes, we have several. In the year
4458 1938 a new steam turbine was installed at the East Wells Street Power Plant, having a capacity of 13,700 kilowatts, and that machine was designed as a by-product turbine, so-called, because the steam was generated at a high pressure and passed through the turbine, obtaining work from it, and then exhausted into the heating system at a pressure of approximately 25 pounds.

By the addition of a comparatively small amount of energy in the heat, to raise the pressure to 650 pounds at which the boilers operate, you are able to take out a tremendous amount of energy in expanding that steam down

the pressure of the heating system, through the medium of the turbine, which generates the electricity, and the steam that is left is, for all practical purposes, just as good for heating operations as if it had been developed in a separate boiler entirely, for that purpose.

We are now putting one in at Commerce Street, having a capacity of 35,000 kilowatts.

That turbine will be installed the latter part of 1941. It is called an extraction type turbine, and we not only take steam off at around 25 pounds for the low-pressure heating 4460
system, but we can take it off at 160 pounds for other uses.

—1,978—

Those other uses would be the transmission of high pressure steam in feeders out long distances to points where the main pressure was sagging.

Something like the analogy in the electric transmission system, where you send out high tension energy to a low tension system, to improve the voltage.

Also, we have a few customers who are buying high pressure steam for various purposes and, for that purpose, we have a set of high pressure mains which are tapped for such 4461
customers. These two developments indicate very clearly that steam and electricity are produced together.

They could not be separated with advantage to the system. There would be serious losses of economy if it were necessary to separate the steam distribution system from the source of supply at the exhaust of the turbine.

This is very helpful to the consumer. I think it is evident that the city is cleaner, having two large stacks with controlled smoke, than if each one of these 968 customers had smokestacks giving off black smoke.

4462 We know that the small individual smokestack is not regulated like the big stack of a public utility.

Also, there is less traffic on the streets on account of hauling large quantities of coal to our plants at night than there would be if coal were being supplied to 968 separate boiler plants.

—1,979—

So there is a very definite civic betterment involved in this.

4463 Customers are, of course, not so much interested in that as they are in the savings that result from joint electric and steam operation, and that comes about by virtue of the fact that the cost of a single steam boiler and extraction turbine, designed to provide the joint functions of electric generation and steam production, is a great deal less than if you were to install a separate heating plant and a separate generating plant.

The economy goes beyond any question of plant investment, which is substantial.

4464 We find a great economy in the joint force that operates the turbine within the plant.

The fact that steam is sent out to the heating system, for example, as well as generating electricity before it goes to the heating system, does not add any particular responsibility to the man that is operating the turbine. You don't have more men operating a turbine on account of that, and hence there is an economy in labor in the plant.

All the way through the plant you have the same economy because the same force has its time charged into two operations, and that economy in labor also extends to economy

in supervision outside of the plant, all the way up to the officers.

—1,980—

Q. What is Wisconsin General Railway? A. Wisconsin General Railway is a wholly-owned subsidiary of Wisconsin Electric Power Company, which was formed for the purpose of acquiring title to real estate.

One of the principal advantages of the subsidiary was in connection with purchases of rights of way for transmission and railway lines, or pieces of property for sub-stations. I 4466
think it is common knowledge that a public utility going into the market can't always disclose just exactly what it is going to do, and hence, of necessity, somewhat larger pieces of land are frequently acquired than would be the case if the Company could buy exactly what it wanted at a reasonable price.

Just suppose, then, that a right of way was wanted across a small farm, the right of way was an extensive one, requiring 200-foot width for, say, a double circuit power line and a parallel 26,000 volt line, and we bought twice as much land, in connection with that operation, as we would have 4467
bought if we could have taken the exact slice we wanted and gotten it at a reasonable price.

The practical application of Wisconsin General Railway in a consideration of that kind is that, after buying the entire parcel of land, the property was charged to Wisconsin General Railway property accounts, and then the exact piece needed for the transmission line would be charged to the account of the company that was really going to use the land, and the balance of the price that would be left on the books

—1,981—

of Wisconsin General Railway was estimated to be a figure at which there might be reasonable expectation of disposing of the property at then current markets.

By having the excess land in Wisconsin General Railway, it was easier to sell the land later, because it was not necessary to have the excess property released from the mortgages of the operating utility.

We have been reducing the amount of land as rapidly as sales could be made effectively, and at the present time con-
4469 sideration is being given to applying the net assets of Wisconsin General Railway against the debt to Wisconsin Electric Power Company, which has advanced the money and disposing of the stock.

Q. Wisconsin General Railway has no activities or operations except the rental and management of this real estate? A. Those comprise all of the operations of the Company.

Q. Now, will you describe for us The Milwaukee Electric Railway & Transport Company? A. The Company which you have just named is a wholly-owned subsidiary of Wisconsin Electric Power Company. It conducts a local trans-
4470 portation business in the metropolitan area and a small transportation business in the city of Racine. The Company has recently disposed of most of its Racine transportation

—1,982—

business, which was done by bus, and has retained only that part which is still provided by street car, and it is expected that that will be discontinued, so that the Company will have, in the near future, no transportation operations in its ownership in the city of Racine.

It also operates interurban transportation service between Milwaukee, Racine and Kenosha; Mill Port, Washing-

ton and Sheboygan; and Milwaukee, Waukesha, Oconomowoc, Watertown and Madison.

In giving that list of cities, to which interurban service is furnished, I am not attempting at this time to state whether it is done by rail service or bus service.

The Milwaukee Electric Railway & Transport Company, commonly known as The Transport Company, presently operates 370 miles of single track.

On this track trolley cars and buses operate over 366 miles of street and highway. 4472

To give you an idea of the magnitude of the business done, during the year 1939, 31,090,018 vehicle miles were operated and 161,380,714 revenue passengers were carried.

The Company operating revenues amounted in 1939 to $9,291,858.00.

The outlying business of the Company is being reduced—that is, property is being abandoned which is known as interurban property, as fast as it can economically be abandoned.

—1,983—

Certain lines, which are not paying their direct operating expenses, are the ones to which the Company is directing its attention, so that those losses will be cut off. Within recent months the Company has been able to abandon about 38 miles of single track and rail service to a number of communities, but it has substituted bus service, which is more flexible and less expensive under the circumstances, particularly that a continuation of the roadbed and rail would require considerable expense for maintenance and replacement in the future. 4473

Before the organization of The Milwaukee Electric Railway & Transport Company on October 21, 1938, the opera-

4474 tions now carried on by this Company, as you know, were part of The Milwaukee Electric Railway & Light Company.

The transportation business of this company and its predecessors preceded the development of the electric utility operations and constituted the foundation upon which the electric business was built.

I don't remember the exact date that electric railways came into operation throughout the country, but I do remember looking out the window one night, when I was a boy,
4475 in the city of Green Bay, and seeing the first street car go up Walnut Street, in 1894.

I remember it because I was told to look out to see my father in the car and the Mayor of the city.

—1,984—

I mention this because I also recollect the power plant where generators were used to provide the motive power for these small street cars which went along the street on two trucks.

They were small steam engines, with very crude generators that were available at that time for five hundred volt
4476 service.

Later on, that location and plant became a part of the public utility and it was used as an electric service station and nothing could be more natural than that that would occur. People who operated the street railway business, in general, around the country, knew about the problems of generating steam and handling generators.

(Discussion off the record.)

A. (Continuing) Problems of electric generation also involved installation and handling of steam boilers and elec-

trical equipment, and there were undoubtedly many of the economies that I have previously talked about, in connection with other joint services present in the joint operation of an electric plant for the two services.

Q. As a result, was it generally true, all over the country, that the electric business grew out of the street railway business, or in affiliation with it? A. I think that many instances of that type can be cited, but it would not be correct to say that that was always the case, because, in Appleton, Wis-

—1,985— 4478

consin, where there was a very early railway system, we have the example of the first hydro-electric station.

Perhaps that was operated—I do know now—by the same interests, but it was in a separate building.

The transportation utility, as now constituted, is really a direct benefit to the electric business, in that it is a very large customer for electricity, and imposes an electrical load which tends to improve the load factor of the system.

In the year 1939, the transportation subsidiaries have purchased 92,472,660 kilowatt hours from Wisconsin Electric Power Company. 4479

(Discussion off the record.)

By Mr. Browning:

Q. During the period of decline of the interurban business, have there been instances where properties which would otherwise have been abandoned, have been taken over by the electric business? A. Yes. The electric company has salvaged operations of that type.

As an example, Mequon Stone Quarry, the operation of which has been discontinued by the Transport Company, was

4480 taken over by Wisconsin Electric Power Company, because it was seeking an advantageous and economical site on which to dump ashes. Mequon Stone Quarry is located between Milwaukee and Port Washington, where the Port Washing-

—1,986—

ton power plant is.

The Port Washington Power Plant has to dispose of ashes. We are about through with one site that we have. Mequon Stone Quarry is right on the transportation lines
4481 of The Transport Company, so it is convenient and economical to take the ashes on what are virtually our own tracks, and dump the ashes in this pit, and there is provision for ashes for nearly 25 years.

Q. You have already given us some statistics as to revenues of the Transport Company. Can you give us some other statistics to show its operations? A. Some of this is a slight duplication. The passenger car miles operated, for example, are 16,803,391. The trackless trolley car miles operated, 4,013,693. The bus miles operated, 9,921,897.

Express, freight, and switching miles, 351,037, giving the
4482 total vehicle miles operated, 31,090,018.

Those figures are of interest only as a guide to how much of the business is furnished by different classes of service.

Q. Those figures are for the year 1939? A. Yes.

Q. I was going to ask if you could give us some figures as to the equipment of the Company. A. The Transport Company owns 566 passenger cars, 235 buses, 124 trackless

—1,987—

trolley cars, 41 express and freight cars, 4 tank cars, and 6 electric locomotives.

It has nine stations for housing rolling stock and buses, one shop for construction and repair of equipment, and four express and freight terminals.

Urban transportation service is furnished, as I previously said, in the city of Milwaukee and suburbs, and I gave you the cities where interurban transportation was available.

There are certain cities which are served only by motor bus, which might be included, together with some villages, and they are cities of Fort Atkinson, Jefferson, Kenosha, Madison, Milwaukee and suburbs, Oconomowoc, Racine, 4484
Watertown, Waukesha, Sheboygan, and the villages of Cambridge, Chenequa, Hartford, Marshall, Pewaukee, Sullivan, Sun Prairie, Waterloo, Belgium, Cedar Grove, Oostburg.

In addition to the facilities owned, as previously described, there is a 600 volt direct-current distribution system supplying power to railway lines, consisting of approximately 461 cable miles of overhead feeder and 134 miles of cable in underground feeders.

Q. Can you give us some relative percentages of operating revenues to show the decline of the transportation business? A. In 1930, transportation revenues were 36.7 per 4485
cent. of total operating revenues, and in 1939, that percentage had declined to 30.1 per cent.

—1,988—

(Discussion off the record.)

The Examiner: We will recess at this point until ten o'clock tomorrow morning.

(Whereupon, at 4:30 p.m., September 25, 1940, the hearing was recessed until 10:00 a.m. the following morning.)

—1,989—

4486

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

4487

Hearing Room 609,
Securities and Exchange Commission Building,
Washington, D. C.,
Thursday, September 26, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

4488 Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

HERMAN O'DELL, MISS E. H. CALKINS, and C. M. MAXWELL, Attorneys on behalf of the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon, GOULD W. VAN DERZEE resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

Q. What is Badger Auto Service Company? A. That company is a wholly owned subsidiary of The Milwaukee 4490
Electric Railway & Transport Company. It operates automobile parking stations and gasoline filling stations. In carrying on these operations, it makes use of certain non-utility company properties.

Q. Properties of what company? A. Of The Transport Company and also Wisconsin Electric Power Company. It buys all its gasoline from The Milwaukee Electric Railway & Transport Company which has large purchasing power in that connection and happens to be the largest user of gasoline in the State of Wisconsin in connection with its motor bus operations. 4491

Badger Auto Service Company was originally acquired in connection with protection of the interurban lines of The Transport Company and it was later that the idea of using the corporation thus acquired for the purpose of putting to work certain non-operating property, was developed.

—1,991—

In that way, we believe that better use has been made of properties which might otherwise be idle. The company is being held pending some advantageous disposition of it.

4492 Q. How many parking and filling stations does the company have? A. About half a dozen.

Q. And is this real estate held for sale? A. Much of the property is held for sale. Some of it is conceivably available for future use.

Q. That is, this property used by Badger Auto Service Company is either held for sale or held for future use of Wisconsin Electric Power Company or The Transport Company? A. Yes.

4493 Q. Now, will you tell us about Motor Transport Company? A. The Milwaukee Electric Railway & Transport Company owns 40 per cent. of the voting stock of a corporation known as Motor Transport Company. This is a trucking company which operates pick-up and delivery service in connection with freight and express business of The Milwaukee Electric Railway & Transport Company.

It also furnishes connecting truck service between The Milwaukee Electric Railway & Transport Company and other railroads and does cross-town hauling between stations of The Milwaukee Electric Railway & Transport Company, on
4494 lines where express cars are not permitted to operate.

—1,992—

Motor Transport Company completes the delivery of goods shipped on the lines of The Milwaukee Electric Railway & Transport Company, but addressed to communities not reached by the railway and brings shipments from such points to the railway.

It also hauls coal to the Commerce Street and East Wells Street Power Plants under a contract which has been approved by the Public Service Commission of Wisconsin.

It is expected that under the contract which there is with the owners of the 60 per cent. of the voting stock, that such owners will ultimately acquire complete ownership of the company and it is thus provided in the contract.

Q. That is, if I understand you correctly, these non-affiliated interests have already acquired 60 per cent. of the stock of the company and are gradually acquiring the balance under the contract to which you refer? A. The contract provides a means by which the balance can be obtained out of the earnings of the corporation. 4496

Q. We have had testimony regarding the electric business of Wisconsin Gas & Electric Company. Does that company also engage in the gas business? A. Wisconsin Gas & Electric Company is engaged in the gas business and furnishes gas to sixty-two communities in southeastern Wisconsin including the cities of Racine, Kenosha, Waukesha, South Milwaukee, Cudahy, Watertown, Fort Atkinson, Oconomowoc, and Whitewater.

—1993—

In the City of Waukesha, it also engages in a steam heating business and in Kenosha it operates a small electric 4497 railway system.

In Wisconsin, trolley buses are classed as street railways. It is really a trolley bus system.

Q. When did the gas operations of the company start? A. As to the exact date, I can't say offhand, but they started prior to the development of the electric service business.

Before the advent of widespread electric service, gas was used for illumination, cooking and many other functions that are now performed by electricity. Gas and electric

4498 *Gould W. Van Derzee—By Respondents—Direct*

services are, therefore, associated services and it was quite logical that in the early development of the electric service business, that the gas companies in many parts of the country should expand into the field of electric service.

Generally, the combination of electric service and gas service results in numerous savings in operating expenses, such as combined meter reading, customer servicing, billing and bookkeeping.

Advantages also accrue through the joint use of certain
4499 properties such as office buildings, shops, right-of-way and automotive equipment, but I shall not attempt at this moment to indicate all of the reasons why such joint operations are effective and in the interests of the customer because that matter will be taken up a little later.

—1,994—

Q. Could you give us some indication of the extent of the gas operations of Wisconsin Gas & Electric Company? A. The gas utility of Wisconsin Gas & Electric Company presently serves 51,474 customers, the majority of whom
4500 are also electric service customers of Wisconsin Gas & Electric Company, and Wisconsin Electric Power Company.

Wisconsin Gas & Electric Company now operates approximately 280 miles of transmission mains and 610 miles of distribution mains and manufactures all of the gas that it sells. During the year 1939, to give you an idea of the size of the business, the company sold 2,001,295,700 cubic feet of gas and these gas operations contributed to revenues to the extent of 27.4 per cent. of the total revenues of the company.

Q. Can you give us the operating revenues by businesses of Wisconsin Gas & Electric Company for 1930 and 1939?

A. A comparison of the total dollars of electric, gas, railway and heating business and the percent that each bears to the total in 1930 and 1939 is of interest because it shows general trends which are not apparent by comparing one year with the next year or the year before.

In 1930, the electric operations of Wisconsin Gas & Electric Company produced operating revenues of $3,783,459.00 and these revenues were 61.8 per cent. of the total operating revenues of the company.

—1,995— 4502

Compare those figures with 1939 for the electric service business in which the electric revenues increased to $4,541,247 and the percentage to 69.5 per cent. of the total operating revenues.

Gas service in 1930 produced operating revenues of $2,114,801.00 and were then 34.5 per cent. of total operating revenues whereas in 1939 gas revenues had decreased to $1,792,200.00 which was 27.4 per cent. of total operating revenues.

The railway operations which I have mentioned but not described produced operating revenues in 1930 of $189,046.00 equal to 3.1 per cent. of total operating revenues and in 1939 railway revenues were $168,000.00 and had decreased to 2.6 per cent. of total operating revenues. 4503

The heating business in 1930 produced $39,673.00 of operating revenue, equivalent to .6 per cent. of total operating revenues, and such revenues for 1939 had decreased to $32,629.00 or only .5 per cent. of total operating revenues.

Q. Is the gas business expanding in the way of extending mains? A. It would hardly be proper to say that the gas

4504 *Gould W. Van Derzee—By Respondents—Direct*

business is static. The volume of business is actually decreasing over the years as shown and generally the company is not extending gas mains. It is, of course, endeavoring to develop, as far as possible, the availability of existing gas mains for new customers that are on the mains or near-by

—1,996—

that want service.

Electric service is, however, developing quite fast and aside from whatever may be the desire of the company in the
4505 future to more or less curtail the expensive extension of gas mains, I think there will be a natural curtailment in this territory as a result of more electric service being used by customers.

Q. You mentioned the transportation operations of the company. Could you describe those a little further? A. Such services consist only of trackless trolley car operations in the City of Kenosha and possibly a gas bus or two. During the year——

Q. (Interposing) During the year, what? A. During the
4506 year 1939, 867,180 vehicle miles were operated and 3,091,557 revenue passengers were carried. The revenue from these operations constituted, as previously indicated, 2.6 per cent. of the total operating revenues of the company in 1939.

Because of the operating economies and other advantages which it was thought could be realized from joint operation of electric and transportation systems in Kenosha and also because of the growing importance of transportation service, Wisconsin Gas & Electric Company acquired the street railway system in Kenosha in 1912.

The present operations are the outgrowth of that system

—1,997—

and the company is naturally not seeking to extend it.

The company also operates a small heating business in the City of Waukesha where it renders electric service. It is presently serving 217 customers and operates only slightly more than a single mile of steam mains.

During the year 1939, 38,524,100 pounds of steam were sold. This business, like that in Milwaukee, originated as a means of making use of by-product steam and is being con- 4508
tinued in the interests of public convenience and necessity. The steam is generated at the Waukesha Power Plant which is held as a reserve electric generating station.

The steam plant also furnishes steam required for the gas works of Wisconsin Gas & Electric Company. Heating revenues amounted to .5 per cent. of the total operating revenues of the company last year.

There is, of course, the same general character of joint supervision that was described at some length in the case of the Milwaukee steam operations and there are somewhat the same general advantages, although live steam is generated 4509
in the boilers which are also required for operation of the gas works most of the time, except when the station may be put into operation in the winter for electric service reserve.

It would be thoroughly impracticable for anyone to go into steam heating business separately in Waukesha or in my opinion in any other place. The business is of minor importance. It is the best example of a completely incidental

—1,998—

business. We aren't making any extensions; we didn't start the business in the first place. We bought it incident to buy-

ing the electric business and it has the same historical background that I have discussed in connection with the Milwaukee operations.

Q. The electric business of Wisconsin Michigan Power Company has already been described. Does this company engage in any other business? A. Wisconsin Michigan Power Company is engaged primarily in the generation, transmission, distribution and sale of electric energy and also furnishes gas service in the cities of Appleton, Neenah
4511 and Menasha.

It also furnishes local bus service in the City of Appleton and inter-city bus service from Appleton to Neenah, Menasha and Kaukauna.

Q. Will you describe for us the gas operations of Wisconsin Michigan Power Company? A. These gas operations are confined to a relatively small portion of the territory that is served by the company. There are at present 9,223 customers, the majority of whom are also served with electricity.

4512 The company now operates approximately six miles of transmission mains and 121 miles of distribution mains. This utility also manufacturers all of the gas it sells.

In the year 1939, it sold 207,828,500 cubic feet of gas,

the sale of which produced 8 per cent. of the company's total operating revenues.

The business is gradually diminishing as will be observed in the comparisons which I will give you shortly.

Q. Will you give us those figures for 1930 and 1939? A. The electric operating revenues of the company in 1930

were $2,963,663.00, equal to 84.2 per cent. of total operating revenues.

In 1939, the electric revenues had increased to $3,179,922 and the percentage had also increased to 88.6 per cent.

The gas revenues in 1930 were $390,683.00, equal to 11.1 per cent. of total operating revenues, and in 1939 they had decreased to $289,729.00 and the percentage increase had also decreased to 8.1 per cent.

Transportation revenues were $164,067.00 in 1930 and 4514
equal to 4.7 per cent. of total operating revenues and these also had decreased in 1939 to only $118,165.00 or 3.3 per cent. of total operating revenues.

Q. Was there any historical connection between the gas and electric businesses of the company? A. The gas and electric systems of Wisconsin Michigan Power Company grew up together in serving the Appleton metropolitan area. The advantages of such joint operation are generally about the same as those that have been pointed out in the case of Wisconsin Gas & Electric Company, and they also will be

—2,000— 4515

further elaborated upon.

Q. Will you describe for us the transportation activities of the company? A. The company operates local buses in the City of Appleton and renders inter-city bus service between Kaukauna, Appleton, Nennah and Menash. In the year 1939, it operated 637,133 bus miles and carried 1,322,495 revenue passengers. I have previously given you a statement concerning the small per cent. that these revenues are of total operating revenues of the company.

4516 Q. Was the business an outgrowth of a street railway business? A. Yes. The electric railway operations were very closely coordinated with the electric utility business. When rail service was discontinued several years ago, buses were substituted. We are not seeking to expand this business. It came with the company as an historical growth.

Q. Are these transportation, gas and heating activities important to the communities served? That is, are they a public convenience? A. They are decidedly so and we find
4517 that the communities want transportation service. There is usually no one else to pick them up at the moment. When a street railway line is discontinued, communities usually want to know what kind of service is going to be given as a substitute.

—2,001—

While they are incidental to the other operations, in the main they are businesses which are highly regarded as a necessity by the communities served.

Q. Is that also true of the same activities of Wisconsin Gas & Electric Company? A. It is.

4518 Q. Does Wisconsin Michigan Power Company own stock in Fox River Navigation Company? A. I have been away from the office for several days and I can only say at this time that it did own such stock the last time I was conversant with the operation.

I say that because I believe that an arrangement has been made which I understood had the approval of the S. E. C., under which the ownership of a small percentage of the stock of Fox River Navigation Company was to be divested and the stock reacquired by the Fox River Navigation Company under a certain agreement, which gave to the owner of the

stock all the rights which would otherwise have accrued on liquidation and I can not say just what was done with that arrangement.

(Discussion off the record.)

By Mr. Browning:

Q. What is Milwaukee Light, Heat & Traction Company? A. That Company is a wholly owned subsidiary of The North American Company. It had substantial electric and railway properties which were sold to The Milwaukee Electric Railway & Light Company in the year 1929. 4520

—2,002—

Q. In the what? A. In the year, 1919. Generally the properties of that company operated outside of the Milwaukee metropolitan area at that time. Some of the non-operating property owned at that time was retained and the company now collects rents, pays taxes and maintains the property it owns.

It has no bonds outstanding and all of its capital stock is owned by The North American Company. It is really an inactive company with a small income from land and interest on notes of the Hevi Duty Electric Company. 4521

Q. Will you describe for us the Hevi Duty Electric Company? A. In addition to the real estate owned by the Milwaukee Light, Heat & Traction Company, it owns 74 per cent. of the capital stock of Hevi Duty Electric Company which is engaged in the design, manufacture and sale of electric furnaces and electric heat treating equipment.

Hevi Duty Electric Company designs and supervises the construction of furnaces and equipment it sells, but the

actaal manufacturing operations are done in the Cold Spring shops of The Milwaukee Electric Railway & Transport Company. There is a lot of history back of the incident that Milwaukee Heat & Traction Company owns 74 per cent. of the common stock of Hevi Duty Electric Company, and I want to take quite a little time to go through the reasons

why there is such a relationship so that you will see, as I think the record will show, that the acquisition of that stock
4523 and the fostering of the cooperative activity of Hevi Duty Electric Company has been of very substantial value to the business of Wisconsin Electric Power Company and to any other electric utilities in the group of The North American Company and possibly outside.

We have been asked quite frequently why we have developed and fostered what is now the largest exclusively electric furnace manufacturing company in the United States and some background may properly be recorded.

It is an outgrowth of early necessity, designed to overcome customer skepticism of electric heating and the then
4524 existing lack of an agency which was able and willing to underwrite results guaranteed to the customer.

That brief synopsis is somewhat ahead of the story but I wanted to put it in at that point.

This company, Wisconsin Electric Power Company and its predecessor, the Milwaukee Railway & Light Company, have been pioneers in a great many things, not entirely in the development of unique and effective means of producing power, operating street cars, and in other fields, but we have been pioneers in the development of a number of very basic sales opportunities.

4525

We have to go back about twenty five years to review the

—2,004—

first one. I want to give that because it is something of this kind. We might, for example, have owned to advantage, the Pittsburgh Furnace Company which was instrumental in developing the electric steel melting business, but it wasn't necessary for us to go that far and I want to describe what we did do with respect to the early developments of electric steel melting in Milwaukee.

4526

The Milwaukee territory, 25 years ago, was a metal trade manufacturing community, including many equipment factories, iron and steel fabricating plants, malleable and gray iron foundries, and twelve steel foundries.

At that time, there was no really suitable electric arc furnace for steel melting. We experimented in a small way through one of our customers with one type that was reasonably satisfactory, but we had to go into considerable research and much further in order to finally develop a really satisfactory electric steel furnace and it was in 1916 that acquaintance was made with a gentleman by the name of W. E. Moore of the W. E. Moore & Company of Pittsburgh.

4527

Mr. Moore we knew, from reputation and some acquaintance, had engineering ability, ideas, and experience for producing what he thought would be a suitable three-phase electric melting furnace.

It is quite desirable to have three-phase melting furnaces so as to balance the load over the three phases of the dis-

—2,005—

tribution system rather than to operate a single phase furnace which has undesirable unbalancing characteristics on the system.

Arrangements were soon concluded with Mr. Moore for him to come to Milwaukee and establish the company then known as the Pittsburgh Furnace Company which would engage in the manufacture and sale of these three-phase electric arc furnaces and design in accordance with our mutual views on the subject.

Among the first furnaces built by the Pittsburgh Furnace Company were two large ten ton three-phase furnaces which were sold to the General Steel Company and placed in very
4529 satisfactory operation in Milwaukee.

All of the engineering and manufacturing facilities which were available as far as we were concerned, were placed at the disposal of the Pittsburgh Furnace Company and the General Steel Company furnaces demonstrated conclusively the effectiveness of the designs which had been incorporated in these initial furnaces.

We manufactured those furnaces for the Pittsburgh Furnace Company in the shops of The Milwaukee Electric Railway & Light Company. That is, the Pittsburgh Furnace Company was merely a selling device that utilized Mr.
4530 Moore's brains. He got the orders with our power salesmen from the customers and then The Milwaukee Electric Railway & Light Company built these furnaces because it had facilities which could be used for that purpose that were

available in its shops and which were generally required in connection with the construction and operation of street cars and other large operations of the company.

Pittsburgh Furnaces, as they were called, subsequently became the principal steel melting furnaces used in the Milwaukee area and practically all of the electric steel foundries

4531

adopted them in place of the earlier and less satisfactory single-phase furnaces.

Later, the manufacturing and promotional relations between The Milwaukee Electric Railway & Light Company and the Pittsburgh Furnace Company were discontinued and the Pittsburgh Furnace Company moved to Pittsburgh and later continued there.

At this point is the proper one to hark back to my statement that in the development of this very important basic sales operation, we might possibly have acquired, and to advantage, we might still have the Pittsburgh Furnace Company, but it so worked out that having utilized those facilities, Mr. Moore was able, because there was no large investment involved to take that furnace business and operate it satisfactorily for the benefit of the industry.

4532

If our company had been unwilling to finance the initial installation and take some measure of loss in case of failure, and had not offered inducements to an arc furnace manufacturer to move to Milwaukee, thousands of kilowatts of steel melting load would not be connected to the company's lines and millions of kilowatt hours of electric energy would have

4533

remained unsold.

With that background, we now go on to why we ultimately have an interest, through one of the subsidiaries, in the Hevi Duty Electric Company. We go to the subject of the resistance type electric furnace and the story of an electric furnace company being moved to Milwaukee to accomplish an important purpose.

4534 Developments in the production and use of machinery, automobiles, farm equipment, trucks, and so forth, during the latter days of the World War, and during the decade which followed, called for specific qualities of iron and steel.

The foundation for these qualities could be established in compounding the metal in the electric furnace, but metallurgists soon discovered that vastly improved results could be achieved by the heat-treating of metals in various stages in preparing them for their final use in the equipment for
4535 which they were manufactured.

This led to research in the field of heat-treating, annealing, carburizing, nitriding and similar technical operations. Developments in electric furnaces were started by various manufacturers and it was found that electric furnaces offered greater refinement in control of processes than any other method and could produce a more definitely predetermined quality of steel. It was impossible at that time to speculate with any high degree of accuracy on the amount of elec-

tricity that could be utilized for heat-treating in the metal
4536 trades, but it was obvious that with the proper development in equipment and processes, this field had tremendous possibilities, the views of the field indicating the possible use of heat-treating furnaces, varying in electrical capacity from 100 kilowatts to 1,000 kilowatts in size.

Further developments led to opportunities for furnace capacities of several thousand kilowatts and I think I mentioned to you a tremendous one, the largest in the country that Hevi Duty Electric Company built for the A. O. Smith Company.

4537

Altogether, it was evident that there was in any industrial center a huge potential market for kilowatt hours in the electric heat-treating field. Developments at first were slow. A number of manufacturers were designing equipment and operating electric furnaces, but it was impossible at that time to get local industries in our territory to make the relatively heavy investment necessary to obtain the equipment without some very definite participation and responsibility on the par of the local utility.

4538

In the Milwaukee district, we tried to analyze the possibilities in this field and the work of various manufacturers of furnace equipment in introducing electric heat-treating processes. —2,009—

We achieved some degree of satisfaction in this field, in 1921, 1922 and 1923, but some very important opportunities were lost because—now, I want to emphasize this—no manufacturer of our acquaintance existed who both could and would take a local industrial problem, prescribe the heat-treating processes, specify the equipment, and furnish, install and place in operation at a predetermined price and with guaranteed agreed upon results in the finished product.

4539

He would not take those responsibilities for an electric furnace. It was obvious in our territory that, unless our company could become the over-all underwriter in the foregoing picture in the adoption of electric heating and the installation of electric heat-treating equipment it would be seriously retarded.

It was found impractical to assume such underwriting where a number of manufacturers and contractors were involved in a given installation, one furnishing plans and specifications, another bricks and mortar and so on.

4540 *Gould W. Van Derzee—By Respondents—Direct*

We therefore began to look about for a source of equipment and adequate facilities for engineering and manufacturing these furnaces.

I had a personal experience in that connection that I remember. It was the case of trying to sell an electric furnace to the Rundle Manufacturing Company back in this period. One company had resistance elements for sale, another offered to put up the steel structure of the furnace and

—2,010—

4541 supply the brick work. Still another had a type of transformer that would operate with the particular connection of windings in this furnace, and there were others involved.

The fact was that when we got all through, that customer turned down electric heat-treating operations that we should have had on the system because there was no one outfit that would guarantee the over-all performance of this collection of component parts provided by several different manufacturers. The utility obviously was not in a position to guarantee those results because it had nothing to do with the design of the furnace nor the furnishing of any part, so there

4542 we were helpless to develop as rapidly as we wanted this extremely important market for electric heating, just because of the absence of a company which would sell a complete electric furnace just as you now sell an automobile.

It was just as if we went to a prospective customer to sell him an automobile and you had only the wheels and someone else had the engine and still somebody else the seat covers. No customer wants to buy equipment on that basis. At that time we had some acquaintance and satisfactory experience with a manufacturer called the Electric Heating Apparatus Company of Newark, New Jersey.

We found that that company had achieved success in manufacturing of small laboratory furnaces and had certain valuable patents and engineering talent for developing even

—2,011—

larger furnaces. They had made a few experimental larger furnaces of the type that I was just talking about which had stood up fairly well.

After some negotiations with that company, arrangements were made for it to move its factory and facilities to Milwaukee. An agreement was executed in October, 1924, and 4544 the organization, together with its facilities, was located by the end of that year in premises leased from our company.

An agreement with this manufacturer gave Milwaukee customers an option on 75 per cent. of the output of electric furnaces. The manufacturer was to furnish and install complete apparatus for the customers and in addition test and demonstrate the performance of equipment and stand back of such guarantees as would be mutually agreed upon.

The manufacturer's sales representatives were to help analyze the requirements of our operating territory and to cooperate with our own commercial engineering forces in 4545 developing this important business.

The agreement initially made was to have the facilities of this furnace company also available to a certain extent to the other subsidiaries of The North American Company and The North American Company actually signed the initial agreement with respect to this development.

The arrangement enabled us to carry out the procedure

—2,012—

which I have just indicated, namely, that we could determine

4546 *Gould W. Van Derzee—By Respondents—Direct*

the requirements of a customer like the Rundle Manufacturing Company that I mentioned, specify the type of furnace that was needed and actually go to town with a development that would produce sales of electrical energy in large quantity by our company.

Shortly after this company moved to Milwaukee, the name was changed from the Electric Heating Apparatus Company to its present name—the Hevi Duty Electric Company. That is the company that I am describing which is
4547 a subsidiary of Milwaukee Light, Heat & Traction Company.

In November, 1925, the factory and offices were moved to a site adjacent to the Cold Spring shops of the company.

Q. Of what company? A. The Milwaukee Railway & Light Company is referred to. And contractual arrangements were made so that the extensive shop facilities at Cold Spring shops could be used in the manufacture of the furnaces.

That arrangement still continues. Facilities of the Cold Spring shops are quite varied and in view of the gradual
4548 diminution of the street car business, there is space available for the manufacture of electric furnaces.

In fact, it seems that that business is gradually getting larger as the street car business is gradually getting smaller. It is at the moment a sort of natural complement to the street railway shop operations, makes use of joint facilities.

—2,013—

The company pays rent for the office space which it uses in a part of the adjacent shop buildings which it might be difficult otherwise to rent.

4549

In the course of time, the control of Hevi Duty Electric Company gradually passed to Milwaukee Light, Heat & Traction Company and that was because this particular type of business, so diversified as to use, requires a great many different kinds of furnaces, and there are continually popping up interesting and profitable fields in which these new furnaces can be developed.

Anyone who has been connected with the manufacturing business, knows very well that developments sometimes take a great deal of money before the apparatus is perfected. 4550
Insofar as we influenced the operations of Hevi Duty Electric Company—and I happen to be an officer of it, so that I can correlate the sales activities of Wisconsin Electric Power Company with that of a manufacturer that will produce efficiently what we want, we arrange such correlation and I think to the benefit of the industry.

We think that the program has worked out with considerable satisfaction. Hevi Duty Electric Company has achieved outstanding results in the production of high-class electric heating equipment for widely varying requirements.

Our troubles with special installations such as we had 4551
with the Rundle Manufacturing Company have practically

disappeared. The engineers and salesmen of Hevi Duty Electric Company which, of course, are on their payroll and entirely paid by them, are a very valuable adjunct to the sales forces of Wisconsin Electric Power Company.

No salesman in our sales department unless he was wholly detached for that purpose, could afford to spend the time required in the education necessary to know all about electric furnaces.

4552 These furnace men have an intimate family relationship with us and we can find out their secrets in advance, whereas the average manufacturer of electric furnaces tells you something when the product is about to come on the market, you have no time to prepare for it, and generally the outside manufacturing company heads don't give out such information.

We are right there at the inception of the ideas. We frequently tell the Hevi Duty Electric Company that we
4553 ought to have a furnace to do a certain thing.

Not long ago I said to Ed Smalley, president of the company, "Why don't you develop an electric garbage burner; such a device might have considerable sale." Well, it turned out that it would be rather easy to develop an electric garbage burner but at the present time it is not a very effective load for the system, but that probably is being worked on and I doubt if any other electrical manufacturer in the country has even thought of it.

—2,015—

You have the types of garbage burners which operate with
4554 a little draft and a match providing you don't have too many watermelon rinds. You have the gas operating garbage burner and oil operating garbage burners, but think how nice and clean an electric garbage burner would be if you just turned a switch.

I recollect also going to Ed Smalley many years ago and saying we ought to develop the electric water heating business. "We will make the rates if you will make the furnace." That resulted in a long chain of study as to the most effective means of developing an electric water heater.

It was considerably ahead of the time that you could go out and buy an electric water heater in almost any up-to-date shop.

You didn't even get guarantees from a manufacturer where you gave him the specifications and told him to go ahead and build one, with perhaps one exception. We found out all we could learn from that one exception and then went ahead on our own hook with Hevi Duty engineers by our side and we lost no motion in working out the problem.

Finally, there was developed a serie of electric water heaters in fifty, eighty and a hundred and twenty gallon sizes and the company took the first hundred off the hands of Hevi Duty Electric Company, which was given an order to manufacture such water heaters and put them out on trial with various customers of the company, and carefully

—2,016—

watched the operations for many months.

It was, of course, necessary to get the cooperation of the Public Service Commission and establish a rate which could be charged for this experimental operation, but evidently we hit on approximately the right idea and the right rate and following our determination that these electric water heaters were operating satisfactorily, that it was a needed service in any community, we gave the company larger orders and expanded the number of water heating customers very materially.

I will jump from that early example of cooperation on an undeveloped device for improving the sales of electric service to the statement that within the last year I, as an officer of Hevi Duty Electric Company and also as an officer of Wisconsin Electric Power Company, said to Ed

4558 Smalley, the president, "We should arrange to go out of the manufacture of electric water heaters because they are being generally manufactured and you can buy them in satisfactory form at satisfactory prices."

—2,017—

Hevi-Duty Company discontinued promptly the manufacture of electric water heaters, sold its rights to manufacture the particular type to the Strauss Electric Company and has completely gone out of that particular business. It is now 4559 devoting energies that it has used in that field to other fields that are undeveloped which we can promote.

Each heating problem is definitely engineered. The industrial operator is given definite assurance as to what he can do with an electric furnace of a definite type and design, but I want to bring out this point that he does not have to buy a Hevi-Duty electric furnace. Experience shows that about 60 per cent. of the furnaces connected to our lines are of a make of the Hevi-Duty Electric Company. There are other competing makes in many fields, although the company has fundamental patents on a number of original designs.

4560 We talk about the steel melting load and the tremendous development of kilowatt hours through that outlet. We have been talking for the last few minutes about the resistance type electric furnace which is a different type from the arc type electric furnace. These resistance type furnaces have coils in them that may look quite like the coils in an electric range. They turn the current on and they glow. The temperature can be raised to any predetermined figure. Generally the same kind of material is used as is used in the element of an electric range. It is nichrome wire, having a

high resistance and capable of attaining a temperature of

—2,018—

approximately 1,900 degrees maximum with safety.

Because of the nature of the resistance elements in the electric furnace they have what is called a high power factor. That is a very difficult term to describe and I shall not attempt it, except to say that if you take this same wire which you have in the furnace, which has very desirable operating characteristics, and if you were to roll it into a coil it would have less desirable characteristics because of so-called induc- 4562
tance losses.

The addition of some 65,000 kilowatts of resistance type furnaces in our operating territory has provided us with a wonderful base furnace load of very desirable operating characteristics through which millions of kilowatt hours are sold annually and we attribute our development in this type of load and in certain other loads to the facilities which Hevi-Duty Electric Company has afforded us.

In other words, we got the jump on industry and this type of development by analyzing the needs of customers and by going out and actually developing in the first instance 4563
suitable arc type furnaces with the Pittsburg Furnace Company, and then suitable type resistance furnaces with Hevi-Duty Electric Company. The era of research and development in that field is not over; probably it is just beginning. It is of such a varied nature, this future field for outlets of electric service in industry, that in the interest of our own company we ought not to really part with such a valuable

—2,019—

adjunct to the sales forces as the adjacency of this furnace company and the ownership thereof if it is possible.

4564 Just as an interesting sidelight, the Hevi-Duty Electric Company has a large sale of small laboratory furnaces and small furnaces, say, from 250 watts capacity to 18 kilowatts of capacity. In all, approximately 50,000 of such furnaces have been manufactured by Hevi-Duty Electric Company. Some of their special furnaces can be found in substantial numbers in the Cleveland territory where considerable heat treating is done and the operations have been very beneficial to the other subsidiaries.

4565 Q. The other subsidiaries of what? A. Of the North American Company.

From a tiny furnace designed to heat treat a false tooth, to the largest electric furnace of 12,000 kilowatts capacity we have in between all sizes and shapes of furnaces and ranges of purposes. The large furnace that I mentioned that was built for the A. O. Smith Corporation about the year 1930 was designed and constructed completely by Hevi-Duty Electric Company and its over-all dimensions may be of interest to you to indicate the size of the facilities that have to be built for some of these operations.

4566 The over-all outside dimensions of that furnace of 12,000 kilowatts are 83 feet long, 42 feet high, and 42 feet wide. That furnace is capable of heating 90,000 pounds of steel an

—2,020—

hour to a temperature of 1,750 degrees F.

If that furnace were to be operated continuously—I repeat a statement that I made a few days ago—it would utilize as many kilowatt hours as all the residence customers put together in the city of Milwaukee. So we are playing with big stakes and big possibilities in this furnace business, not with big profits to furnace companies but big profits to the

electric utility that has control of it and directs its destinies along the lines that it should go.

One of the most interesting and perhaps the most recent developments that have been carried on by Hevi-Duty Electric Company is in connection with Alloy 10. That is the name of the alloy. Alloy 10 is a patented mixture of iron, chromium and aluminum, which patents Hevi-Duty Electric Company were instrumental in developing to the point of issuance. While the exact metallurgical work was not done by that company, the idea of the necessity for a resistance wire 4568
which could be heated to higher than 1,900 degrees originated with our interests. This wire has been developed at substantial expense. It is now being used in medium sized electric furnaces and it will ultimately open up a tremendous field for the use of electric service in ceramics and other operations where temperatures from an electric furnace up to 2,400 degrees must be obtained.

It is really a marvelous development that has not been fully recognized as yet by the industry, but I predict that

—2,021—

over a period of years that single development fostered by 4569
our sales department and the Hevi-Duty Electric Company will add many more millions of kilowatt hours to the lines of the company and to other companies, perhaps, and will take its place along with the long line of original developments which started with the electric arc furnace, followed by the resistance furnace for low temperatures, and as I say now we are going into the field of resistance type furnaces for high temperatures.

We know that the joint promotional and research work undertaken by The Milwaukee Electric Railway and Light

Company and continued now by Wisconsin Electric Power Company and the Hevi-Duty Electric Company, during the past 12 years at considerable expenditure of time and money, has been justified many times through the addition of revenue-producing furnace loads of desirable characteristics.

Q. You have described the activities of all of the companies in the Wisconsin Michigan group of subsidiaries of the North American Company, in addition to the electric business, is that correct? A. I have.

4571 Q. Do any of these other activities have any detrimental effect on the rates for service of the electric businesses? A. I can state most definitely that they do not have any detrimental effect on the electric service business of the com-

pany. On the contrary, I think that I have given plenty of examples to indicate that collectively they are of great advantage, and that there is no one single one in the group that is detrimental.

The Trial Examiner: Let's have a recess.

4572 (Whereupon, after a brief recess the hearing resumed.)

By Mr. Browning:

Q. You testified that Wisconsin Michigan Power Company owns approximately 27 per cent. of the voting stock of Fox River Navigation Company? A. Yes.

Q. What is Fox River Navigation Company? A. Fox River Navigation Company is a company which owns a couple of tugs and seven barges. It hauls coal from Green

4573

Bay to the company's plant and to the plant of a few other stockholders. It practically furnishes such services at cost.

I have previously testified that we expect to have an arrangement completed whereunder the stock of approximately 27 per cent. of the total owned by Wisconsin Michigan Power Company will be reacquired by Fox River Navigation Company, reserving under suitable agreement liquidating rights, and also providing that the present director, Mr. Schubert, will resign from the board.

4574

Q. Does the investment which Wisconsin Michigan Power Company has in this company approximate the proportion of the volume of freight which the navigation company handles for Wisconsin Michigan in relation to the total

—2,023—

volume handled? A. Yes.

Q. Does the Navigation Company handle freight for anyone other than its stockholders? A. I believe not.

Fox River Navigation Company has an application pending for exemption and the Securities and Exchange Commission has been advised of the arrangement proposed between Wisconsin Michigan Power Company and the Fox River Navigation Company for disposal of its stock and directorship.

4575

Q. Does Wisconsin Electric Power Company perform any accounting services for its own steam business and for the Transport Company in addition to services for its electric business? A. Yes, the accounting department of Wisconsin Electric Power Company does perform accounting services for the Transport Company and the heating utility in its own business and I will describe the nature of these

several joint services that are so performed by each important division of the accounting department of Wisconsin Electric Power Company.

First, we will take the general accounting division. This division maintains the general accounting records for both the Transport Company and the heating utility of the company. All accounting operations necessary to keep the accounts of the Transport Company and the heating utility in accordance with the uniform Classification of Accounts
4577 are performed by this division. That is in addition to the

—2024—

maintenance of the accounting records, regular and special reports are prepared from time to time, also special analyses are made and data accumulated.

The record maintained for the Transport Company are entirely separate from the records of Wisconsin Electric Power Company. The records for the heating utility, while complete in themselves, are a subdivision of the records of the electric company.

The second subdivision of the accounting department
4578 which performs joint accounting services is the accounts payable division. Invoices for equipment, material, services, etc., covering the operation of both the Transport Company and the heating utility are directed to this division for payment. The essential functions performed by this division are to audit these accounts and be sure that payment to be made is proper, prepare checks for payment, maintain necessary records and files and carefully watch the discount dates in making these payments.

Invoices covering the payment of purchases for the heating utility are made on Wisconsin Electric Power Company

checks and payment for the Transport Company purchases are made on checks of the Transport Company.

When I use the term "Transport Company" I mean The Milwaukee Electric Railway and Transport Company, and it has no reference to the Motor Transport Company.

Miss Calkins: When you are speaking of the heating utility company you are referring merely to a division of Wisconsin Electric Power Company and

—2,025—

4580

not a separate corporate entity?

The Witness: Yes, I have not intended to refer to it as a heating company but as a heating utility which is a subdivision of the company's activities.

Miss Calkins: I don't mean to get off the line here and cross-examine but I just want to get your testimony clear. This accounting department then is rendering services only for one other company.

The Witness: That is correct.

Miss Calkins: That is what I wanted to know.

The Witness: It is rendering services for one other company and for the incidental service of heating. 4581

The third division of the accounting department to be discussed is the property and plant accounting division. Property and plant accounting records for both the Transport Company and the heating utility are maintained by this division. I described some of the activities of this division in previous testimony but generally the purpose of these records is to establish and maintain a complete and accurate record of all items of property and embrace such informa-

tion as description of property, date acquired, cost or amount, date and amount of property additions, and data relative to the retirement of all property from the company's service.

Records maintained for the Transport Company are separate from those of the Electric Company.

—2,026—

The fourth division of the accounting department which performs a usual joint service is known as the 4583 mechanical accounting division This division performs services for both the Transport Company and the heating utility, in addition, of course, to the electric utility operations of the company.

The punching of cards and preparation of reports covering accidents, receipts and disbursements of materials and supplies, inventory of stock material, property records, and apportionment and clearing of accounts is done by that division.

Services relative to the preparation of rolling stock in the department and transportation department pay 4584 rolls are performed for the Transport Company. Performance of work for the Transport Company and heating utility increases the volume of available work and permits a schedule of work in such a manner as to maintain a high machine load factor, in fact a higher one than would be possible if each performed its own work separately. The higher the machine load factor the lower the machine rental cost per unit of output. We have to rent these machines. They are not owned. It is like the shoe machine

manufacturing business which rents many of the machines used.

The higher volume of work also reduces unit labor costs and one person can operate a number of sorting and tabulating machines at one time. Full-time attendance would be required even though there were fewer machines to operate.

The fifth division of the accounting department which performs joint accounting services is known as

—2,027— 4586

the centralized pay roll division. The centralized pay roll division performs the following services for both the Transport Company and the heating utility. It maintains social security records and prepares the necessary reports therefor. It maintains state and federal unemployment compensation records and prepares reports and data as required. It maintains a complete file of master employee record cards and performs other pay roll services such as recording data relative to employees entering and leaving the service, changes in amount of wages, date thereof, etc. 4587

This division also performs timekeeping and pay roll work for the Transport Company. It is expected that these services will also be performed for the heating utility starting October 1 of this year.

In other words, we have not perfected the centralized pay roll work to the extent that it now covers all of the departments but we experimented several years ago with two or three divisions and we are gradually taking over all the pay roll work from

4588 *Colloquy*

different departments so that they have no pay roll clerks preparing the final pay roll. It is being done in a centralized pay roll department.

A sixth customers' accounting division performs work for the heating utility consisting of the preparation of steam service bills and work related to the billing operations, delivering bills to customers, performing credit and collection functions relative to

—2,028—

4589 the handling of steam service accounts, addressographing pay roll checks and similar operations.

Services performed for the Transport Company embrace such items as these, addressographing transportation time cards and pay roll checks, billing of inter-company and associated company accounts, rental for properties owned by the Transport Company and rented to others, collection of rent and maintenance of records and reports covering rented properties, billing tenants of the Transport Company for use of electric service, accrued credits to be charged

4590 such as for charter service, and the accumulation of data and preparation of invoices relative to services performed for outside customers.

A seventh division of the accounting department which performs work jointly for the operation of the heating division of the Transport Company is called the report and development division. In view of the fact that this division makes studies and prepares reports and performs development work for all accounting department operations, the work is performed for the Transport Company and the heating utility.

4591

Recently considerable work has been performed for the heating utility in connection with the proposed transfer of the power plant department pay roll work to the centralized pay roll division. I mentioned that other divisions will shortly take up that work and this report and development division is a little division within the accounting department which needs to be

—2,029—

very close to the operations and is sort of a miniature research bureau, working on problems entirely within the accounting department. 4592

A large amount of work has been performed for the Transport Company in the development and improvement of pay roll and time-keeping work performed by the pay roll division. Work performed for the mechanical accounting division covers both the heating utility and the Transport Company.

Last, we have an eighth division of the accounting department which performs these joint services called the cashier's division. Relative to the work performed for the heating utility this division receives payment for steam service and deposits the money collected. 4593 Work performed for the Transport Company includes separation of tickets and cash, that is the contents of the fare boxes, counting of the cash taken from fare boxes, and sale of tickets and passes, counting of redeemed tickets and transfers, supplying stations with tickets and passes, depositing cash receipts, and auditing cash, ticket and pass balances of each station once a month.

4594 *Gould W. Van Derzee—By Respondents—Direct*

In my opinion, the result of all this centralized accounting is a very substantial economy.

Q. Does the operating research bureau perform any functions for other companies? A. It does.

Q. Will you describe those? A. I think it is advisable

—2,030—

that I describe this organization. This organization known as the research bureau is made up to a great extent by
4595 trained engineers and accountants, and functions as a joint facility available for special studies and investigations to the Transport Company, the heating utility and other associated and affiliated companies.

Q. Those include Wisconsin Gas and Electric Company and Wisconsin Michigan Power Company? A. They do. When so employed, the services of the research bureau are charged against other organizations and I refer you to Mr. Schmidtman's testimony yesterday as to the basis of such charges.

Such arrangement insures competent unbiased services
4596 for the user and saves that organization from maintaining such trained man power on its own pay roll. This plan also makes it possible to maintain a highly trained specialized group of analysts with an efficient load factor for its man power, whereas if each maintained its own special investigators such would not be the case and the result would be inferior work of higher cost.

The following instances which I will give are where the operating research bureau has been of service to the Transport Company and to the heating utility particularly, and also to associated companies:

First, internal audits are made for the Transport Company and for heating utility as well as for other affiliates

—2,031—

and covers such items as cash audits, voucher audits, pay roll audits, and stock auditing, general supervision of accounting functions, particularly with respect to interpretation of accounts and methods, is furnished by the bureau.

Second, the bureau furnishes a considerable amount of services in connection with income tax studies and reviews the returns of the associated companies for both state and 4598
federal governments. In fact, very definite instructions are followed with respect to the functions of this one group that they shall review the income tax returns and give to each company the benefit of their long experience and knowledge.

All tax audits made by the state or federal tax department, as previously stated, are checked and negotiated, and tax litigation is followed. I remember that our tax experts in the research bureau a year or two ago, when we were endeavoring to clean up all of the unsettled tax cases with the state, did a very substantial amount of work for Wisconsin Gas and Electric Company and Wisconsin Michigan Power 4599
Company, and for what was the old Milwaukee Electric Railroad and Light Company before the separation.

The work of following property tax assessments falls to the bureau. Capital stock tax returns are examined and details of filing are followed.

Third, special depreciation studies and analyses for affili-

—2,032—

ated companies and for the heating utility are carried on by the bureau. I have personally been rather close to the sub-

4600 ject of depreciation and particularly since the Uniform Classification of Accounts was issued by the Public Service Commission effective January 1, 1938. That provided that within a year each company should make a detailed study of depreciation, of depreciable property, by classes of service and present it to the Commission.

The operating research bureau was charged with the job of making the reports on depreciation of that character for all of the companies and it was a stupendous piece of work.
4601 No man or group of men not thoroughly familiar with the property in the field and records of the use of property could possibly have prepared it.

That same Classification of Accounts required that within thirty days each company should state what objections it had, if any, to straight line depreciation, and if it had any objections it should state the method of depreciation accounting that it thought should be employed for the respective company and why.

Our companies had not operated on the straight line basis of setting up depreciation. Historically, they had gen-
4602 erally been on a sinking fund basis and that was particularly true of The Milwaukee Electric, Railway and Light Company. Later, Wisconsin Gas and Electric Company and Wisconsin Michigan Power Company adopted sinking fund depreciation with 3½ per cent. interest on reserve balances cred-

ited to the depreciation reserve annually.

It was up to the research bureau engineers to sit in at hearings before the Public Service Commission on this extremely important subject and to follow it through to a conclusion for the several companies.

The first result of that work by the research bureau has been the recent order that I mentioned, that the executive committee of the Wisconsin Electric Power Company reviewed relating to depreciation on the sinking fund basis for Wisconsin Electric Power, and similar orders are expected for the other properties.

That is one of the very highly specialized services that this group of men give to the properties as a whole and we believe that in the first place it would be very difficult to find men who, by long training and experience, would be able to 4604
perform such work if each company had to have a special group of that kind, and it seems obvious that one group can perform more work for the several companies cheaper and better in this instance than if each company were to try to set up its own group of tax experts and workers on depreciation.

Fourth, in the past considerable assistance has been furnished to the associated companies in connection with the preparation of reports and schedules necessary for the refinancing plans. There is a lot of ground work that has to be done locally and the boys in the research department are 4605

the ones that have done that for the several companies.

Fifth, particularly for the Transport Company the bureau prepares exhibits and presents testimony for service extension hearings and fare cases before regulatory bodies. We have one man in the bureau who supervises that type of work and, of course, does other work, too, when there aren't any fare cases, who has become an expert over the years in putting in a type of testimony that is required in the many ap-

4606 plications of citizens for extension of bus services and changes in transportation facilities.

There is great advantage in having such an individual in the bureau and he can work on other things when there are no transportation cases.

Sixth, special studies bearing on the economics of modernization of facilities are prepared for the Transport Company. That is the type of problem that arises when a Mayor or an Alderman in some district goes to the news-
4607 papers and says, "I think we should have trackless trolleys on Center Street, instead of the existing street cars."

The bureau, in connection with a problem of that kind which ultimately comes before the council and for which the company has to put in an appearance and report, makes a very extended study of the economics of the situation. They find out from the property and plant record division, which is just 100 feet down the hall from the office of the operating

—2,035—

research bureau, what that piece of track cost. They go back to the original work orders and from our property record that
4608 is reasonably easy to do. Then from their knowledge of depreciation they figure out what the unamortized investment is, how much of the property investment has not been offset by depreciation in the reserve of the Transport Company.

We need to know that because we want to know what useful life is left and from an accounting standpoint what we are going to do with it when we find out what it is.

Then they make an estimate of the cost of new facilities that will be required to substitute trolley buses for the street cars. From long experience their knowledge of trainmen's

4609

wages and schedules enables them to estimate the expenses of the bus operations and their maintenance. Finally they produce a report which is the basis for the Transport Company president to determine whether or not the company should, for economic or other reasons, oppose the change of the rail service to trolley bus service on said Center Street.

The preparation of reports of that kind means a very long intimate experience with the properties is necessary. These men who work on that subject have that experience and it would be an uneconomical thing to push them over 4610
on the Transport Company payroll just because they have it and make them work continuously with that company because they are also trained in other things, to supply the

—2,036—

needs and services of other companies and effectively fill in the balance of their time on those things which they would have no means or authority to do if they were placed on the payroll of the Transport Company. It has no operating research bureau and performs no such functions for other companies.

4611

Mr. Browning: Mr. Examiner, I think we might suspend at this time.

The Examiner: All right. We will recess the hearing until two o'clock this afternoon.

(Whereupon, at 12:30 o'clock the hearing was recessed, to reconvene at 2:00 o'clock p. m.)

—2,037—

4612 *Gould W. Van Derzee—By Respondents—Direct*

AFTERNOON SESSION

(Whereupon, at 2:00 o'clock p. m., the hearing reconvened.)

Whereupon, GOULD W. VAN DERZEE the witness on the stand at the time of recess, resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

4613 Q. You were describing certain instances in which the operating research bureau has been of service to various associated companies and have given six such illustrations. Will you give other illustrations? A. Seventh, the bureau prepares reports for the use of directors of the company and it also prepares the fundamental information that is presented to the president with respect to each company for a letter which he writes to the Board of Directors which is delivered to each member by the 15th of the month.

4614 There is really quite a lot of fire department research necessary in such a proceeding. For example, our preliminary statement is done in condensed form about the 10th of the month covering the operations, showing the revenues by important groups and the expenses by important groups, but not in the detail that is in the more detailed report which comes out about the 15th to the 20th, and it is necessary to get from the books the reasons for principal departures

of revenue and expenses from the corresponding month of last year and also from the budget, and to write statements with respect to those departures so that the president can

4615

incorporate them, after he has studied them, into this letter to directors.

The research bureau does the ground work on that for all of the companies. Where it hasn't right at hand reasons for things, it gets in touch with the treasurers, secretaries, or operating officials at the companies in Appleton and in Racine.

Eighth; land and property appraisals. Establishment of rentals for leased property and power rate studies are made for The Transport Company by the Bureau. There was a very detailed study requiring many appearances before the Commission on the question of what is the proper rate for the electric company to charge The Transport Company for power service. The power service is 600-volt direct current.

4616

The facilities to produce that 600-volt direct current are all owned by the electric company so it was necessary to make a detailed study of the character of the railway load and to determine the various elements of cost all the way down from the generator to the rotary converter that changes alternating current at the sub-station to the 600-volt service required at the trolley.

4617

Mr. Schmidtman did a great deal of work on that particular subject. It is typical of one of the largest problems that is done for The Transport Company by the research

bureau.

Ninth; exhibits used for cases before regulatory bodies are prepared. One of the examples of these cases is information necessary in the application to erect the East Wells Street and the Commerce Street stations.

While those stations are owned by the electric company, they do have an important function in providing heating service, which is one of the incidental businesses we have been discussing.

Also the research bureau has prepared many statistics and data necessary in the application of Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company.

Tenth; construction, retirement and operating budgets for the heating utility and The Transport Company are pre-
4619 pared in the bureau.

Mr. John Dockendorf, whom I have described as a member of the research bureau, in fact, assistant research engineer, was appointed as head of the budget division of the inter-company accounting committee, made up of members of the subsidiaries of North American Company.

Mr. Dockendorf was chosen because of his rather extended knowledge of the preparation of budgets.

The preparation of agreements and contracts for filing with regulatory bodies fall with the bureau and involves The Transport Company as well as other facilities. There is a so-
4620

called affiliate statute in Wisconsin which requires the filing of an approval of arrangements made between affiliates. The Bureau prepares those for all the companies in our group in a uniform manner after consulting with the various departments as to detailed information necessitating these agreements and it undertakes to answer the Commission's inquiries about them.

Twelve; monthly reports of a financial and statistical nature for the American Transit Association and other ques-

tionnaires and annual statements for directories are prepared by The Transport Company for the bureau.

Thirteenth; reports to the Federal Power Commission and to other Federal agencies are regularly prepared in the bureau and cover operations of other affiliated companies.

Most questionnaires, except those involving scientific information about power plants and the like, go to the research bureau from the different companies so as to have a uniform method of preparation and answer.

They know what the companies desire to do and usually 4622
when one of the companies gets one of that kind, he merely sends it to the research bureau and if there are any questions, they are answered and it is determined whether the answer is to be sent out or the questionnaire put in the ice box.

We virtually have to have a questionnaire department and it is concentrated in the bureau.

—2,041—

Fourteenth; gain-sharing plans, more commonly known as bonus plans, are prepared and maintained by the bureau for The Transport Company, heating utility and Wisconsin 4623
Gas & Electric Company.

Certain bonus records are maintained for employees of the heating utility and The Transport Company by the operating research bureau.

Fifteenth; the bureau offers statistical and other experience to The Transport Company and to the heating utility in connection with labor and wage negotiations.

We have one man in the bureau, Mr. Larkin, who is quite an expert on matters of that kind and he renders consider-

4624 able service to The Transport Company and also to Wisconsin Gas & Electric Company and Wisconsin Michigan Power.

Just recently there was an arbitration over some matter in Wisconsin Gas & Electric Company at Racine and Mr. Larkin was selected by Wisconsin Gas & Electric Company because of his intimate knowledge as to the company's arbitrator.

Sixteenth; the development and establishment of con-
4625 tinuous property records, inventory of physical property, reclassification of accounts and special property map records as well as development work on acquisitions of property, have been prepared for Wisconsin Gas & Electric Company and for Wisconsin Michigan Power Company by the bureau.

The last item, development work on acquisitions of property is one that makes a rather big file in the research

bureau. One of the men you have met—Mr. Schmidtman—has done a very extensive amount of work on that. I think his latest piece of work was in connection with the acquisi-
4626 tion of the Narrows Dam property.

He made an extended study in the field. Some fifteen years ago—or, perhaps, I should say between ten and fifteen years ago—Mr. Schmidtman made a study of a large hydro-electric development in upper Michigan, called Sturgeon River Development.

Q. For Wisconsin Michigan Power Company? A. For Wisconsin Michigan Power Company or its predecessors.

We were thinking at that time that it would be an important acquisition, to acquire this most northerly water

power site, nearly up to the northern boundaries of upper Michigan at Lake Superior, so Mr. Schmidtman spent many weeks there. That was one of the properties that I later came to The North American office on, with respect to the final acquisition, and Mr. Browning happens to be the man that wrote up the contract for me—the contract between the owners of the property and our interests.

There are undoubtedly many minor operations that the research bureau performs, that don't come readily to my mind. They cover all phases of operation. 4628

—2,043—

The operating research bureau is really an arm of the management of the several companies. Instead of having assistants attached to each office of an officer within any one company, these men are all in one place, and their service does not only apply to all the officers of the Wisconsin Electric Power Company, but to the other companies as well, as I have described in many instances.

I have been with the Company so long that I can remember just how the operating research bureau started. It just started out of necessity of having detailed information 4629 worked up and kept and at the fingers' ends of experts. One of our present vice presidents—Mr. Seybold—started in the research bureau as far back as 1919.

It was formulated shortly before that time and has been expanding in size and usefulness, and economical operation for the several companies, ever since.

Except for Wisconsin Electric Power Company, I doubt if any—and I am certain that no other company could afford to have that group of trained experts, and by "other com-

pany" I mean other company in our group of four major companies in the Wisconsin Michigan group of properties, namely Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, Wisconsin Michigan Power Company, and The Milwaukee Electric Railway & Transport Company.

For Wisconsin Electric Power Company it has been a great advantage to have this diversity of use, and similarly

—2,044—

4631 for the other companies, it has been a great saving to, in effect, be able to buy the character of service that the bureau gives, for the reasonable price at which it is furnished.

You have to compare it with what these other companies would be up against. They would either have to have their own facilities or they would have to buy it from some engineering concern on a per diem basis, when they needed it, and that is an expensive type of information, and you really can't get it from outsiders.

Another reason why it would be practically impossible to consider setting up a group that functions like the operating

4632 research bureau does is that the men who make up the operating research bureau can't be duplicated overnight.

They can't be duplicated in a year, and some of them in a decade. It takes long, intimate experience with the property to grow men like those we have in the bureau, of which Mr. Schmidtman is an example.

Q. Does The Transport Companys' rolling stock department render any services to Wisconsin Electric Power Company? A. It does.

This is an example of services being rendered by the Transport Company to the Electric Company:

During the past twelve-month period ending August 31, 1940, a total of 657 inter-company orders have been received by the rolling stock department of The Transport Company

—2,045—

from the Electric Company electric and heating utilities. These orders were for a great variety of manufacturing operations and services, which the rolling stock department, with its tool equipment and personnel can perform efficiently and at low cost for the Electric Company.

Such an arrangement eliminates the necessity for the 4634
Electric Company to duplicate tools, facilities, and the personnel, for such manufacturing operations and services, and in total the work is performed at a lower cost to the Electric Company than the cost of contracting for these manufactured items and services with outside companies.

I say that because the boys are very careful to go out and get prices where there is any question in their minds. When they have budgets, within the limits of which they have to keep, you can be sure they are not unnecessarily giving away any money, and in border line cases, I have heard some very definite discussions on, "Why don't you do this 4635
to make it cheaper; you can sell it to us at a lower cost," and so forth.

The major service for the Electric Company is the purchasing of automobiles and trucks used by the various departments, the designing and construction of special bodies for such trucks as required, and the maintenance, servicing and housing of these trucks.

At the present time there are 168 such automobiles and

—2,046—

trucks, which are owned by the Electric Company, and maintained, stored, and serviced, by the rolling stock department.

The rolling stock department personnel is trained in the care of the large fleet of The Transport Company's—the buses and trucks—and is well qualified to maintain Electric Company-owned automotive vehicles.

Space available in The Transport Company garage and other buildings is used for housing these vehicles, all of
4637 which eliminates the necessity for the Electric Company to have duplicate facilities and personnel for taking care of these cars.

The rolling stock department, you understand, is housed at the Cold Spring shops.

We talked about the shops this morning. The department that lives there is this department known as the rolling stock department.

The rolling stock department has other buildings and car stations for the maintenance of cars as they come in every day, but its main shop facilities and operations are
4638 at the Cold Spring shops.

The rolling stock department engineers specialize in the study of methods for promoting gasoline and lubricating oil economy in automotive vehicle operations.

The experience and knowledge of these engineers is used in establishing standard practices and procedures for care and operation of the automotive vehicles owned by the Elec-

tric Company.

Gasoline and lubricating oils, used in both The Transport Company and the Electric Company vehicles are in accord-

ance with specifications and test data prepared and accumulated by the rolling stock department engineers.

The procurement of State Motor Vehicle Department and City licenses for automotive vehicles, owned by the Electric Company, is also handled by the staff of the rolling stock department.

The Cold Spring shops of the rolling stock department are so equipped and manned as to be in a position to manufacture and perform services for the Electric Company efficiently and at low cost. 4640

The shop divisions, with a brief review of more important work performed in each division, has value at this point, and I will enumerate these divisions and principal functions very briefly.

The paint division handles vehicle washing and cleaning, vehicle painting, sign painting, seat upholstery, cloth cutting and sewing, leather work.

The carpenter division of the rolling stock department handles overhaul and repair of vehicle bodies, the construction and reconstruction of vehicle bodies, mill work, cabinet work, pattern work, and sheet metal work, as required, and 4641

—2,048—

glazing.

The bus repair division handles general inspection of automotive vehicles, overhaul and repair of automotive vehicles, cleaning of chassis and mechanical parts, construction of special truck bodies.

The forge division has a blacksmith shop and does forge work and blacksmithing. As required, it does heat treating, rail bending, and track, special work assembly, tool dressing and oil and waste reclamation.

4642 The motor and truck division of the rolling stock department handles the overhauling of railway car trucks, air piping and electric wiring. Pipe shop work is done as required. Air tanks are tested and repairs made to wrecked steel car bodies.

The machine division of the rolling stock department does car wheel and axle work, heavy machine operations, light machine and bench work as required, automotive engine and other automotive parts overhauling and repairing; plating,
4643 lacquering and buffing work; air compressor and air equipment repairs, and has a tool room.

The electrical division of the rolling stock department does repairs to electric motors and overhauling of same, armature and field coil winding and rewinding, winding of armature coils and control equipment coils, automotive electrical equipment repairs, control equipment repairs, repairs to track switches, telephone boxes, signal boxes, et cetera; armature commutator turning, slotting, et cetera.

—2,049—

There is a foundry in the rolling stock department, and it
4644 handles brass, aluminum and non-ferrous alloys, as required; the tinning and babbitting of bearings, and sand blasting.

The furnace department handles the fabrication of steel, assembly work, oxy-acetylene and spot welding that is required.

The plant maintenance and boiler room of the rolling stock department handles maintenance and repair of heating, electric wiring and plumbing equipment, and it includes the Cold Spring boiler plant operation and takes care of inspection of elevators around the property.

The tire division handles tires and tubes; disassembled repair, and assembling, on wheels.

The foregoing outlines the general character of the work performed at the Cold Spring shops.

The shops are well-equipped with tools and they are well-staffed to overhaul, construct, and rebuild railway cars, trackless trolley cars, motor buses, miscellaneous gasoline equipment, and other equipment mounted on wheels.

Further, it performs much of the manufacturing of repair parts for this equipment, with tools, facilities, and organization for this work. 4646

It is capable, without additional equipment or supervisory personnel, of performing many manufacturing operations and

—2,050—

services for the Electric Company.

Rolling stock department shop costs, which include overhead and billing charges, are checked against outside companies' prices and deliveries for the various items, and the shops are favored with this work only when it is economical for the Electric Company to do so.

I think you will see, from the number of inter-department orders of various kinds, that have gone through in a year, that there are many instances in which it is favorable for the Electric Company to makes uses of the manufacturing facilities of the rolling stock department of The Transport Company. 4647

When the separation of the properties was made, I wanted to see personally just what was involved in this inter-company work, and so I directed that all of the inter-company orders from one company to the other must pass over

4648

my desk for personal signature and I do see and sign all of those orders.

My purpose was to get an executive quantitative look at the nature of these inter-company transactions.

Sometimes when I don't understand the nature of the work I make inquiry as to what it is. That is not so true with respect to orders to manufacture a few bolts, or some such group of items, but frequently The Transport Company will send in an order reading, "Charge us for the rental of
4649 space occupied in some building for the year nineteen so-

—2,051—

and-so on the following basis and the following amounts."

I usually send those up to the research bureau to find out if the rental has been made in accordance with the agreements approved by the Public Service Commission, and, if they have been so made, put my initials on and send the order on.

I just happened to remember one item that came through not long before I left. It was, "Make 5,000 pole tags for Wisconsin Michigan Power Company."

4650 I just mention that to indicate that the orders are not all for The Transport Company that go through.

Q. Or for Wisconsin Electric Power Company? A. That is right.

(Discussion off the record.)

Q. Do the Cold Spring shops of The Transport Company perform any services for Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company? A. They do, but they are not of quite the magnitude of the Electric Company.

Q. Can you give us some idea of the nature of the orders received by The Transport Company from the Electric Company? A. The nature of the orders received and the amount of manufacturing work for the Electric Company at the Cold Spring shops naturally varies a great deal from month to month.

—2,052—

A review of such orders received from the electric and heating utilities for the past twelve months reveals a large number of different kinds of orders from the various depart- 4652
ments.

Now, as to items manufactured or repaired for the electric distribution department of Wisconsin Electric Power Company, there are 54 different types of operations, among which I might mention making cable bushings, rewinding coils, machine manhole lids, making switch hooks, repairs to junction boxes, welding transformer cases.

An analysis of the orders received by The Transport Company from the sales department of Wisconsin Electric Power Company shows five different kinds of operations, two examples of which would be weld coils, clean and dip 4653
electric refrigerator parts.

The same analysis shows that the power plant department sent in nineteen different kinds of orders to The Transport Company, rolling stock department.

These are some examples:

Make and repair patterns.

Make bronze, copper, and brass castings.

Make thermo-couple connectors.

Furnish glass.

4654 Maintain locomotives and other rolling stock used in the power plant yards.

—2,053—

The purchasing department apparently has sent in six different kinds of orders to the rolling stock department, such as:

Repair trucks.

Make roller towels.

Repair chairs and furniture.

4655 Even the advertising department of the Electric Company has two typical types of orders to the rolling stock department:

Make truck top signs.

We utilize the tops of all of our trouble cars and appliance repair cars to have electric company signs, advertising seasonal operations of the sales department, refrigerators, lamps, electric cooking.

There are little frames resting on the tops of the cars, into which cards can be inserted showing such advertisements.

4656 There is one inter-company order from the real estate department of the Electric Company, requesting the Cold Spring shops rolling stock department to mount maps.

The accounting department sent in four different types of orders, such as:

Overhaul and repair coin separator.

Repair cash boxes.

Make cloth bags.

Make bill distributor bags.

—2,054—

I think it is evident that the accumulated effect of all these inter-company transactions is very substantial and that there are substantial economies as a result of the availability of these facilities operated by people in the family.

Mr. Browning: We are prepared, Mr. Examiner, to give considerably more detail on this type of thing. For example, we have a list of 91 different operations, which could be enumerated, within the classification which the witness has just described.

We had not felt that greater detail was necessary, but 4658
if the Commission counsel want us to give more detail, we should be very glad to do so.

Miss Calkins: I don't believe that it is necessary.

By Mr. Browning:

Q. Does the garage of the Electric Company render any services with regard to vehicles owned by The Transport Company? A. It does. The electric distribution department garage of the Electric Company, which is located right near the Cold Spring shops, in addition to maintenance of all 4659
electric trucks used by that Company, provides convenient storage space for servicing of some of The Transport Company's trucks.

The vehicles which are stored in the Electric Company garage are the line trucks which put up the overhead trolley

for the railway system, and the double trolley for the trackless trolley cars, and at that point are also stored a number of parts required for overhead construction, because it is more convenient, on account of the availability of space, in

4660 *Gould W. Van Derzee—By Respondents—Direct*

keeping that overhead construction material used in Transport Company operations at that point where the trucks are stored.

This particular, relatively small amount of stock, for the purpose indicated, is really owned by the Electric Company. It was not transferred at the time of the separation. Ultimately that stock may be transferred to The Transport Company.

Proper accounting exists between the two companies with
4661 respect to disbursements of such Electric Company stock for Transport Company's purposes.

The Electric Company and The Transport Company have an agreement, whereby either company will provide the other with available vehicles on a car-hour rental basis, sort of a taxicab service.

The arrangement is especially advantageous in the case of special equipment with low use factor, such as trucks equipped with hoists, derricks, and so forth.

In general, even with standard equipment, the interchange agreement makes possible a lower total investment
4662 in vehicles, since, in any operation involving large numbers of trucks and passenger cars, a certain amount of dead storage time is involved.

—2,056—

The coordination of the garage and fleet facilities reduces the idle time to the very minimum.

These facilities are used, say, in such an instance:

The real estate department needs an extra car to go to a certain point at a certain time. It only has one car. It applies to The Transport Company for a car it may have on hand.

Similarly, The Transport Company may come to the Electric Company for a car or truck, to avoid buying one.

Q. Is there any joint arrangement with respect to a common medical department? A. There is; through an arrangement between the Electric Company, The Transport Company, the Employees' Mutual Benefit Association, and other affiliated Wisconsin companies, the Electric Company's Public Service Building at Milwaukee maintains what I think is a truly remarkable medical and surgical clinic.

Without the cooperative arrangement between the companies the present excellent facilities could not exist. 4664

In addition to the clinic, emergency operating room, and consulting rooms, the facilities include complete X-ray and fluoroscope equipment, bacteriological and physiological laboratory, physiotherapy facilities.

That refers to these new facilities for short wave heat-treating, where you have to get down deep with the heat.

—2,057—

The facilities and services of the medical department are available in cases of industrial accidents or illness involving employees of any of the affiliated companies. 4665

The department also serves transportation passengers or customers requiring emergency attention or later treatment due to accidents involving the service or equipment of the companies.

The medical department also serves the Milwaukee area by conducting all physical examinations prior to employment by applicants of the affiliated companies.

The chief surgeon and assistant chief surgeon of the Electric Company serve affiliated companies in other cities

4666 *Gould W. Van Derzee—By Respondents—Direct*

in Wisconsin, either in a consulting capacity or for surgery requiring special skill.

Dr. E. W. Miller, who is the chief surgeon, and also medical director of the E. M. B. A., is a very skilled surgeon of considerable renown in Wisconsin.

Many times I have heard him say, "Well, I am going down to Burlington," or "East Troy", or someplace like that, "to-night. So-and-so has to have an emergency operation for appendicitis," meaning someone on the Wisconsin
4667 Gas & Electric System, or someone located elsewhere.

The cooperative arrangement has demonstrated its many advantages to the affiliated companies and to their several thousand employees.

—2,058—

I testified yesterday, in connection with things which have been done to promote employee relations. I talked about the inception of the E. M. B. A. and the medical service that it gives.

It just so happens that that idea was formulated and
4668 fostered by the president of The North American Company in 1912, and I repeat that it is one of the greatest influences that I know of, in creating employees' satisfaction with their work. It is a great thing for an employee to know that all of his medical attention is taken care of, for himself and wife and dependent children up to 18 years of age, by the mere payment of 75 cents a month.

It is really the equivalent of an insurance operation. The funds are pooled. Everybody isn't sick at the same time. But the total amount that was paid in by the six thousand odd members of the several companies provides a working

4669

fund which, of course, the companies duplicate, which enables our employees to enjoy a degree of medical attention that I doubt is surpassed or even equalled in many places in this country.

Q. Does this pooling of facilities by the affiliated companies result in economies? A. There are unquestioned economies from the pooling of these facilities, that are almost self-evident.

No one company could hope to duplicate the medical department that we have on the fourth floor of the Public Service Building, except Wisconsin Electric Power Com- 4670

pany, and even that company gets benefits from the joint use by other companies.

Q. It reduces the expenses of that company? A. Anything contributed by the other company helps the company that would otherwse have the full load in any of these operations.

Mr. Browning: Mr. Examiner, we are using the term, "affiliated companies" throughout this testi- 4671
mony, and I think perhaps the record should show that, when using that term, we are referring generally to the corporations included within the so-called Wisconsin Michigan group of subsidiaries of The North American Company.

Could we take a few minutes recess?

The Examiner: We will have a five-minute recess at this time.

(Whereupon a short recess was taken.)

4672 *Gould W. Van Derzee—By Respondents—Direct*

By Mr. Browning:

Q. Will you state what work the advertising department of Wisconsin Electric Power Company perform for The Transport Company? A. The advertising department of the Electric Company is equipped and regularly performs advertising and publicity work for both the Electric Company and The Transport Company. With the combined function, it is possible to maintain a small group of advertising special-

4673 ists with the necessary diversification of skill at a good load factor. Without the combined function, it is doubtful if either company alone could justify such an organization as a department of the company.

Careful investigation has repeatedly indicated that, from the standpoint of cost, such an organization is advantageous to both companies.

This is the little group that, prior to the separation, did the advertising for The Milwaukee Electric Railway & Light Company, and it has just continued to do that work.

Q. Now, will you describe the inter-company services
4674 performed by the employee-training division of Wisconsin Electric Power Company? A. A division of the Electric Company is set up to conduct training work, which may be divided into the following activities:

Training.

Library services.

Accident prevention.

Special services.

A staff of trained people in the field of employee education is a part of the organization of the Electric Company.

4675

In some activities, training is done directly by members of the staff, while in others it only supervises the training program.

—2,061—

One of the major activities is a foremen conference program, designed to bring about improved supervision, particularly with respect to employer-employee relations.

The meetings planned and material prepared for this program can, in many instances, be used in The Transport Company with little additional time spent or material used.

4676

Prior to the separation of the companies, the 400 or more so-called foremen met in little groups of 25 or 30, with representatives from various departments of The Transport Company, and the Electric Company together in a room, to learn about the other fellow's business and to discuss various types of programs and projects.

In that meeting, a representative of this training division is present and he does as little talking as possible, and merely directs the course of the discussion.

Since the separation, we have tried to keep up the same general type of program, because of the great advantages in it and I think we are successful in doing that.

4677

An apprentice-training program is supervised and counseled by the training division for The Transport Company, because contacts with vocational schools and regulatory bodies have been established by the Electric Company training division.

The machinery for the production of manuals, visual education material, posters, instruction books, having been

—2,062—

4678 *Gould W. Van Derzee—By Respondents—Direct*

established for the Electric Company, is available for producing similar material for the training of transportation employees, with reduced overhead costs to both.

I recollect, not long ago, that Mr. Nielsen, the educational director, was preparing a film to be shown throughout the various car stations to the trainmen.

It was an address by Mr. Pinkley, the president, followed by statements by the superintendent of transportation, Mr. Kuemmerlein, comments on labor and other things which
4679 were thought wise to put into the film.

That was prepared completely by this training division which was once the training division for both companies and now is formally the training division of the Electric Company, but made available for The Transport Company.

A member of the training division's staff is designated to do job training for car, bus, and trackless trolley repair men.

He has the supervision of the educational directors, stenographic and clerical help, and all training aids of the training division.

4680 The members are also available for special assignments during emergencies—if the foreman is ill, around vacation, or if a peak inspection period develops, assistance from this individual has proved to be helpful.

The training of office employees involves practically the

same procedure in both companies.

Bulletins, courses of study, manuals of instructions, are invariably conducted jointly.

While the Electric Company has by far the greater number of office employees, the addition of The Transport Com-

pany employees in any of these activities entails little extra expense.

The Electric Company, at its main office building, maintains a library of technical books, trade magazines, periodicals, and pamphlets.

Magazines are ordered, circulated and filed. Centralization of this function avoids duplication and reduces overhead charges.

Accident prevention activities are primarily educational in nature and as such are a part of the employee training 4682
division.

Program plans incorporate investigations and reports of accidents and also safety inspections and reports. Information concerning accident prevention equipment and material is gathered.

Investigations are made and recommendations are presented relative to the use of such equipment and material. Rules for safe conduct of work are developed and revised if necessary. Posters and bulletins are obtained or prepared and used extensively to further accident reduction.

—2,064— 4683

Safety codes and publications are obtained regularly for use in the program. Safety meetings are scheduled frequently. Articles are prepared for the employees' magazine which is known as the "Rail & Wire."

Statistical reports and accident studies designed to indicate the progress of the program are prepared periodically. Special studies of specific factors in accident prevention are pursued as it appears advisable and pertinent. Reports prepared in the industry are studied. Contact is maintained with the National Safety Counsel at small expense.

4684 The company engages actively in accident prevention presentation of the Milwaukee Safety Commission and the Milwaukee Association of Commerce.

These items and other activities pursued toward the reduction of industrial accidents are planned and reviewed regularly by a committee of executives and department heads. Since the problem of industrial accident prevention is very similar in the Electric Company and in The Transport Company, the latter company is also represented on this com-
4685 mittee and has available and uses the items of the program.

The Transport Company also has available from the Electric Company the services of its superintendent of accident prevention. Such consideration of industrial accident prevention by both companies is decidedly more advantageous and effective than would be divided consideration by separate accident prevention organizations.

—2,065—

The prevention of public accidents in transportation service is an important activity in The Transportation Com-
4686 pany. The program covering this phase of accidents is under the direction of the transportation accident prevention committee composed of several of its executives and supervisory staff. The superintendent of accident prevention, of the Electric Company acts as its secretary, follows the assignments and assists in the development and pursuit of its program.

The training division is frequently called upon to assist in such special activities as contests for employees, dealers or the general public and the gathering of information from questionnaires and replies to requests for data.

4687

The experience of the employees of the training division is available to The Transport Company for such special activities. This, I think, is another example of the joint use of facilities which effect economies in this direction.

Q. Is there any joint use of employment facilities? A. Yes. We have a great variety of occupations in the electric heating and transportation business and many of these occupations can be filled only by employees who have undergone rather extensive periods of training.

4688

In order to select employees who are capable of developing into responsible operating employees, a testing program has been developed by the electric company.

An employment personnel has been established to develop

—2,066—

and administer selection tests, that are used not only for new employees but also for employees that are to be transferred. Many years ago in this educational and employment division, we devised a special apparatus for testing of motormen. We tried to find out if there was such a device that he could operate on before his employment which would register some of his characteristics as to quick reaction time, safety in emergencies, and the like.

4689

We spent quite a little money and considerable time working on that. We had with us at that time a man by the name of Vitiles, who was very helpful in the development of that work and he later went with the railway.

We have had occasion to back-check on our judgment in using this selection test machine and we find that we have had rather good results from it.

4690 We have developed other types of tests for stenographers and they are rigidly put through a course of inquiry into their qualifications by the employment office before they are employed.

We attempt in all possible ways to sift out those who will not make good public service operators.

The Transport Company has problems similar to those of the electric and heating utilities. Experienced car and bus operators are not available on the open market. It is
4691 necessary to select candidates for employment who are likely to succeed after a rather extended training period.

—2,067—

Failure to become a competent operator after time and money have been spent is a rather expensive procedure. In view of the rather specialized employment problems mentioned above, it has been found most economical and advantageous to operate a single employment bureau and have all selection tests conducted by one trained group of employees.

Not only does the operation of the centralized employment bureau eliminate the necessity for duplicate records,
4692 office space and office equipment, but it also results in obtaining of applications from a much larger number of people which in turn broadens and improves the field of selection.

The employment applications contained in the employment bureau are available to and made use of by Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company in addition to The Transport Company.

Another important advantage made possible by the operation of a single employment bureau is that it provides a medium for the clearing of employment information and it

makes possible the leveling out of employment peaks and valleys.

Work in the various divisions as well as between companies can be scheduled so as to maintain continuous employment for the maximum number of people. The providing of more regular employment for employees performing certain types of work not only improves the position of these employees but the company is also benefited through the

—2,068—

4694

reduction of unemployment compensations and the training costs which are also present in short-term employment, even in the less skilled occupations.

Q. Does the Electric Company use the claim department of The Transport Company? A. It does. Before the separation of the two companies there was one claim department and the major amount of the claim work was in the transportation end of the business.

When the companies were separated, The Transport Company undertook with the same group of people the problem of handling the claims of the electric company, even though 4695
they operate in the transport building which is a separate building from that of the public service building in which the main office of the Electric Company is housed.

The Transport Company, because of the nature of its business, has many claims filed against it for transportation accidents and alleged accidents as well as a host of minor claims and over the years this work has of necessity been taken care of in what we call the claim department, with a well trained staff of investigators and agents, as well as an

4696 office force to handle the files of important records of claim cases.

It is quite important to keep that file because every now and then some fake accident is reported, sometimes you can trace back in the files that the same individual has tried it once before. You may not think that it is possible to do that

—2,069—

but it is.

The Electric Company, because of the very different na-
4697 ture of its business has relatively few cases involving claims for accidents or due to the conduct of its business. The ratio of claim cases is about one electric case to nine transportation cases. Because of this situation, the electric company cannot justify a full-time claim agent and the necessary assistance. A part-time functionary would be possible, but claim settlements is a specialty involving great attention to detail, knowledge of accidents and their causes, knowledge of people and how to deal with them in such a way as to arrive at a just and fair settlement commensurate with the company's responsibility.

4698 I don't know of any branch of the company's business that is quite as important from the public relations standpoint as the claim department. A person who hasn't had his claim settled to his satisfaction is bound to be a sore spot for a long time so we have tried to instill in our claim forces down through the years, the fact that they are not only working to keep down the cost of claims, but they are working to preserve proper public relations.

Rather than establish its own claim department, the electric company has taken advantage of the availabiilty of the services of the well trained and efficient claim department

of The Transport Company and has contracted with that company to handle all of its claim work.

—2,070—

I will be able to [illegible] you, when we discuss the method of inter-company charges, how the claim charges and costs that accrue against the Electric Company are paid to The Transport Company.

I think it is evident that with the small amount of claim work which the Electric Company has, the Company could not afford to set up a claim department such as it was used 4700
to having, when the two companies were together, but there is no good reason why it should not make use of this well trained and efficient claim staff and it does just that and it is an economical thing to do.

Q. Will you describe the joint use of the printing department of Wisconsin Electric Power Company? A. The printing department of Wisconsin Electric Power Company produces the major portion of all printing work required by the electric and heating utilities of the Electric Company and The Transport Company.

In the separation of the companies, this was a problem 4701
of deciding whether the printing business should go with The Transportation Company or remain with the Electric Company and it was decided that it was proper that it remain with the Electric Company on account of the vast number of different kinds of forms used and the growth of the Electric Company which was ahead.

The output of the printing department consists of electric service bills, payroll checks, office forms, advertising matter for the electric and heating utilities, railway and

—2,071—

motor bus fare tickets, transfers, passes, schedules, office forms, checks, and advertising material for The Transport Company. This printing material is furnished at a low cost because of the highly efficient use of capital, labor and material made possible by the combined use of the printing department by the electric and heating utilities of the Electric Company and by the The Transport Company, and the efficient use of specialized machinery in the maintenance of high load factor upon the machines. The combined orders for printed
4703 material are sufficient to fully utilize the capacity of several types of presses. Each job is turned out on the press most suited for the work and by specialized employees.

The combined volume is sufficient to permit simultaneous operation of two or more automatic presses by a single operator. The combined volume also permits adequate equipment which can be quickly made available for work of a special nature, unusual volume, and work requiring rapid completion. One special advantage of the diversified equipment and personnel which is made possible by the combined work of the electric and heating utilities in The Transport
4704 Company is the complete and accurate control of all valuable papers which are printed.

Transportation tickets, for example, passes, transfers, have a substantial cash value. Payroll and voucher checks are examples of other printed material which requires

special care to avoid theft.

Because the volume of combined work permits the use of several identical pieces of equipment and several employees of the same skill, the printing and other operations

4705

on valuable papers can be handled in a specially enclosed portion of the shop by a certain employee who can be made responsible for every sheet of paper or cardboard issued to them for printing.

This is possible because on the days when such valuable papers are printed, the main press room can go on with the regular production of miscellaneous material while a few employees can devote full time to the one job of printing the valuable papers.

4706

We check up on every sheet of paper issued to the printing department for ticket stock—torn sheets, destroyed sheets for one reason or another, together with the sheets of completed tickets so that there is no stock left and it is very important that this be done.

The material cost of printing is, of course, reduced because of the joint use of printing facilities, since paper, ink and other printing supplies can be purchased advantageously in larger quantities.

4707

I think we mentioned yesterday that the fact that we operate rather efficiently must be the case since we could not expect that that Capital Transit Company would give us the business at the prices we charged if they could buy

—2,073—

them here with better work or lower prices.

Q. Is there common use of a physical and chemical laboratory? A. Before answering that question, I would like to add at the end of the discussion on the printing department that the printing department of Wisconsin Electric Power does a very substantial amount of business for Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company at advantageous prices.

4708 *Gould W. Van Derzee—By Respondents—Direct*

(Discussion off the record.)

—2,074—

Miss Calkins: Mr. Van Derzee, is the Capital Transit Company, located in the District of Columbia, the only other subsidiary of The North American Company for which the printing department does work?

The Witness: Outside of the Wisconsin-Michigan
4709 group, that is true. There are certain limitations to the amount of that kind of work that one can do effectively.

We are not seeking additional outside work.

By Mr. Browning:

Q. Now, will you describe for us the joint use of the physical and chemical laboratory? A. The electric company maintains a well equipped and staffed testing laboratory, primarily for the purpose of testing coal samples and other materials and supplies used in the electric and heating
4710 utilities.

Availability of such a laboratory has provided a convenient and economical service for The Transport Company in testing materials used in the construction and maintenance of street railway property.

One of the major services performed by the testing laboratory for The Transport Company is a testing of physical properties of concrete used in the construction of buildings and pavement. Other tests performed by the laboratory include such items as steels, varnishes, disinfectants, weed-

killing solutions, coal, acid and other material carried in the store rooms.

—2,075—

The weed-killers are used on the right-of-way of the inter-urban lines.

Testing welds made by track welders has improved the efficiency of welders and reduced the number of expensive track repairs caused by broken track welds.

Street car wheels and axles are purchased in accordance with rigid specifications. The testing laboratory tests and 4712
analyzes the steels to check on the specifications.

Q. Is there a joint use of the pipe shop? A. Yes, pipe cutting and fitting becomes a sizeable task in the maintenance of power plant equipment when several large power plants, smaller heating plants and steam heating distribution systems are involved, taking care of this work.

A pipe shop has been equipped with pipe machines and a group of steamfitters and brick masons trained in the field of the work principally for the electric and heating utilities. A relatively small amount of heating equipment maintenance which The Transport Company has each year would not 4713
justify the organization and equipping of a pipe shop entirely for the transport operations.

The additional pipe work which The Transport Company furnishes, can be economically done by the present large force of the electric company pipe shop because it can be done during slack periods and thus provide an established work schedule for the pipe shop group.

—2,076—

The boilers at seven car stations and one repair shop are inspected annually by these same pipe shop employees. Any

4714 pipes needing replacement or brick-linings in need of repair are taken care of at these inspections. A distinct advantage of having a pipe shop so conveniently located is the stock of fittings and valves carried for the electric company work.

This greatly reduces delay and obviously reduces the cost to The Transport Company. In the event of a failure of any of the heating units of The Transport Company buildings, delays in repair are reduced materially because a large group of trained employees are available at the electric com-
4715 pany.

From time to time, the street railway shops need odd pieces and sizes of pipe which can be obtained from the scrap piles of the pipe shop which reduces the amount of waste material for the electric company and produces low-cost source of material for The Transport Company.

A group of plumbers have their headquarters at the pipe shop although they are organized under the heating utility. Plumbing repairs in The Transport Company buildings are made by this group on inter-company orders.

4716 Installations of plumbing fixtures have been standardized throughout the two companies, which means that a group experienced with maintenance in one company can effectively take care of the work in the other company.

Q. Does the plant engineering department of the electric

company perform any inter-company services for The Transport Company? A. Yes, the plant engineering department I described yesterday in some detail and is one of the divisions which does work for the other companies, in the blueprint division. In addition to work for electric utility, em-

ployees of this division perform all the blueprinting work for the heating utility which embraces reproductions of plant lay-outs, plant equipment, underground systems, service installations and statistics.

Blueprinting is also performed for The Transport Company for all tracings which are in file in the plant engineering office relating to the properties of The Transport Company. This joint operation of blueprinting for the heating utility and The Transport Company, permits of a greater load factor for the blueprinting machine which in turn 4718 results in a smaller unit cost per copy.

It also allows for more efficient use of labor and materials as the volume of work rates a highly specialized type of worker and promotes operating economies.

Q. Is this also true of the photostatic division? A. Yes, the plant engineering department has a photostatic division. This division makes photostatic copies of correspondence, statistics and documents for the electric and heating utilities of the company and for The Transport Company. The

—2,078—

investment in the photostatic machines is a large one and the 4719 volume of work to be performed is limited. Joint use is necessary in order to justify the expenditure for the present equipment.

Of course, a great deal of equipment of that kind was there when the two companies were together and it was justified by having the work that the transportation and electric and heating departments of the then Milwaukee Railway & Light Company provided.

Now that they are separated, there is the same work for the machine. You can't afford to get two machines where one

4720 will do the work. You would have two men working on two machines.

We have a drafting and engineering division of the plant engineering department. Engineers are engaged in drafting and engineering work for the electric and heating utilities and for The Transport Company where structural and architectural work is involved.

This may occur in the redesign of piant lay-out, rearrangements of plant equipment, modernization programs or
4721 new installations to attract new business and decrease cost of operation. Because of the wide experience of the engineers in similar work for the electric company and the singularity of purpose, this work can be done at the lowest possible cost and provides sufficient fill-in work to keep the engineers employed steadily.

—2,079—

We don't, in this division, take care of the engineering work, drafting, which is 100 per cent. peculiar to the transportation company.

It has its own engineers on track lay-outs and operations
4722 of that kind in the transport building.

There is another division called the building division of the plant engineering department. All work which would require additional expense for labor and special work which can not be conveniently handled by the heating utility or The Transport Company, because of their scope, and the fact that the work is infrequently performed, is assigned to the electric company's building division.

This work involves air-conditioning of buildings, painting of bridges, mason and shoring jobs, carpentry, painting and glazing work, and general maintenance of buildings of

the electric utility, the heating utility and The Transport Company.

These four divisions are concrete examples of economies that can be obtained from the plant engineering department by virtue of doing work for other companies which are affiliated.

Q. Is there any joint use of the purchasing and storage department of the electric company? A. The general office division of the purchasing and storage department performs both purchasing and stores service for The Transport Com- 4724
pany and heating utility in addition to the services performed

—2,080—

for the electric utility. Some of the services which are performed for other than the electric utility follow:

The first is under the heading of the purchasing division. Purchasing services are performed for both the heating utility and The Transport Company. These services cover the purchase of stock materials, purchases for direct delivery and contract purchases, and embrace the operation of obtaining price quotations and the determination of reliable ven-
dors who sell us the goods, placing the order and following 4725
the order right through to point of delivery. Passing of invoices to the accounting department for payment is also included.

Since the efficient performance of purchasing operations requires experienced personnel and careful attention to both current and future prices and conditions, it is more economical to have the purchasing services for both companies performed jointly by a single group than to set up several purchasing groups in each company.

4726 *Gould W. Van Derzee—By Respondents—Direct*

In the purchasing and stores department is also the division of the stores department. This division maintains a perpetual inventory record of all stock material carried in the store room, of the electric and heating utilities and The Transport Company; physical inventories are made upon the request of this division and all differences between the physical and book values are carefully reviewed and investigated.

—2,081—

4727 Joint performance of these operations by one group and under the supervision of one individual, eliminates duplication in personnel, records and equipment and results in lower cost for both the electric company and The Transport Company.

Q. Is there common janitor service? A. The janitors in the Public Service building are under the direction of the purchasing and stores department. The electric company operates janitor service for the entire building which includes services for offices occupied by the heating utility and the waiting station, car shed and car station of The 4728 Transport Company in the Public Service building. Individual performance of janitor services by The Transport Company and the heating utility would add to the personnel and supervision required and increase the cost to all concerned.

Q. Is there joint use of the real estate department? A. There is. The real estate department of the company maintains a staff whose broad knowledge of all problems concerning real estate is available to the electric and heating utilities and also to The Transport Company.

4729

The maintenance of a separate real estate department by The Transport Company is not justifiable when it is considered that the volume of work is sufficient only for one employee. Such an employee could not have the broad knowledge in all the related fields which is now available through a larger trained group.

—2,082—

It is in the interest of economy, efficiency and flexibility that a trained staff be maintained to provide joint service.

4730

Problems and transactions which are wholly or partially assumed by the real estate department for The Transport Company and which are also regularly handled for The Transport Company, including the following:

Purchase of properties needed for operation, disposition of properties no longer required, obtaining local tax bills and checking, checking assessments on non-operating properties to determine that they are equitable, and if they are not equitable, then the real estate department sees the assessor and puts in the usual story about what is a fair assessment.

4731

Payment of local tax bills, insuring that operating properties are exempt from local taxation; sometimes the character of a building changes and operations that were non-utility become utility operations and when that occurs it is the duty of the real estate department to follow it along and see that there is no local taxation on such a piece of property, that that is included in the ad valorem assessment made by the State on operating properties.

The care, maintenance and rental of non-operating properties is handled under the direction of the real estate de-

4732 partment. It obtains permits for overhead trolley lines, including attachment of wires to buildings and similar duties.

—2,083—

There is, in my opinion, very distinct and important economies in having this real estate department which formerly operated for both the electric, heating and transportation divisions of the old company continue in this work doing the same job for the companies which have been separated.

4733 Q. Does the power plant department of the electric company render any joint service? A. The power plant department operates all electric generation plants in the district heating system, and also the power plants furnishing steam to the district heating system. This centralized operation of power plants and steam service facilities for furnishing steam to the heating system has the following advantages:

The common usage of improved operating methods developed by large central stations such as Lakeside, maintenance crews of electric generating plants available for use in mak-

4734 ing repairs to heating boilers.

The labor of heating plants during off-heating seasons is used in electric generating plants for vacation relief and maintenance work.

That materially improves the load factor and reduces unemployment compensation. Experience, supervision and testing of crews maintained for electric generation eliminates duplicating these services for heating plants. Experience gained in plant design and construction of rapidly extending electric generating plant made available when extensions or

—2,084—

replacements are made in heating plants and service facilities. The steam furnished to the heating system is supplied from either boilers operated at approximately 165 pounds and supplying steam directly to low or high pressure systems, or from the exhaust of turbo-generators such as the 13,700 kilowatt machine that I described yesterday or the day before as being located there and performing the dual function of electric and heating production.

This combination of electric generation and by-product steam to the heating system has the following advantages, 4736
some of which I have previously enumerated.

Investment required in plant equipment in a combined plant is less than that required for separate plants and equipment to carry the same electrical and steam loads.

Steam generation by the boiler of the combined plant being used for both electric generation and steam for heating, reduces the total boiler capacity required considerably. The largest single loss of a condensing steam generating unit is eliminated by supplying the exhaust steam from the turbine to the heating system instead of to the condenser.

This large saving in heat consumption could only be made 4737
by a combination of electric and heating load. At the East Wells Street Power Plant, the heat consumed per net generated kilowatt hour, while exhausted to the heating system is about 5,000 B. t. u.

—2,085—

I think I went into that matter in some detail yesterday.

Q. I think you did. A. And I think I sufficiently explained the great economies that come from joint operation.

Q. I think you did. A. By taking out of the steam at high pressure a kilowatt hour before the steam is sent to

4738 the heating system. Substantial savings in operating costs such as labor, maintenance and supervision, are realized in the combined plant due to the reduced boiler capacity required to be operated to carry the combined load.

Q. Does the electric distribution department of the electric company perform any services for The Transport Company and the heating utility? A. The electric distribution department of the electric company performs services for the electric utility, the heating utility, and The Transport Com-

4739 pany.

The Transport Company also performs certain services for the electric utility of the electric company.

Following is a brief description of certain instances of these joint operations in the engineering division:

The engineering division performs services for The Transport Company upon order. These services embrace the handling of special problems relating to signal systems and railway feeders.

—2,086—

The engineering division is also requested to review all

4740 proposed feeder changes. The fact that the electric company has a staff of highly trained engineers is of material assistance to The Transport Company and that these engineering services are available to them at a cost far below that which would result if they maintained a complete engineering division of their own or employed the services of outsiders.

Engineering services are also furnished to the heating utility in the form of assistance on certain special problems and in working with the members of the heating utility to maintain proper clearance between underground structures.

4741

We also have an underground division in the electric distribution department. This division performs services for both the heating utility and The Transport Company. Services performed for the heating utility include primarily the digging of trenches and tunnels.

Inasmuch as the operations of the electric utility require a large amount of tunnel and trench work, performance of this type of work for both utilities by a single division reduces the cost of both by elimination of duplicate personnel and equipment.

4742

This division performs the underground cable work for the Transport Company. Inasmuch as the electric company has trained personnel and complete equipment for its own use, work can be performed for The Transport Company

—2,087—

at a fraction of the cost which would be required for The Transport Company to provide duplicate facilities.

The electric company also benefits in these joint operations in that it serves to improve the work load factor and spread overhead costs over a larger volume of the work.

4743

Approximately 935,700 feet of duct owned by the electric company is used for railway cables owned by The Transport Company; that is, all the duct in the separation of the companies was transferred to the electric company.

We have another division known as the testing division of the electric distribution department. This division performs meter testing services for The Transport Company and the heating utility.

—2,088—

Relative to work performed for the heating utility, electrically operated meters used to measure pressure in the

steam mains are tested, adjusted and repaired by this division. Other services performed by this division for the Transport Company are the making of electrolysis surveys, installing equipment in accordance with existing conditions and maintenance of records.

In view of the fact that the relationships of power cables, railway cables, telephone cables, etc., all have an effect upon each other, it is desirable that this work be performed by a single agency. Again, the performance of all work by a
4745 single group eliminates duplication of trained personnel, records and equipment, resulting in lower cost both for the electric company and the Transport Company, and in this same division we have the stores division.

The Hillside store room, in addition to carrying material and supplies for the electric company, maintains a stock of railway overhead and signal materials and supplies for the Transport Company. The store room maintains 24-hour service so that the material can be obtained for emergency use any time of the day or night.

Reclamation of used material is also performed by this
4746 division. Substantial economies accrue to both the electric company and the Transport Company for the joint use of these stores facilities due to the elimination of duplicate personnel, operating and supervision, buildings, equipment

and operation costs. This is particularly true when you consider that these storerooms are open 24 hours a day and the fact that you would have to have three shifts of duplicate personnel if you had to have separate organizations.

In the electric distribution department we also have a records division. This maintains a record of the Transport

Company's railway, field and signal system. Since maps, records, equipment, etc., are maintained by this division for the electric company the handling of these Transport records can be performed at a relatively low cost.

Then we have the trouble division of the electric company which is a division of the electric company which is a division of the electric distribution department, and it provides emergency service to the Transport Company. That is the same thing that it did for the transportation division of the old company before the separation. 4748

This service covers such items as clearing broken trolley wires and bridging feeder sections to maintain rail service.

Then we come to the telephone division. The electric company maintains a private telephone exchange which serves, in addition to the electric utility, the heating utility of the Transport Company.

Q. Heating utility and the Transport Company? A. And the Transport Company.

—2,090—

Out of a total of 1,418 instruments the Transport Company uses approximately 271 instruments jointly with the 4749 electric company and 318 instruments as direct or full use. This joint use of the private telephone exchange results in lower costs to each, namely the heating and electric utilities and the Transport Company, through reduction in investment and lower operating and overhead expenses.

That was one of the facilities that it would have been extremely foolish to have duplicated. The railway business requires telephones located on poles at various rail intersections which the trainmen use to call up the company on. The

telephone system is an extremely expensive investment and it was decided that it ought to remain with the Wisconsin Electric Power Company and that charges be made to the Transport Company for its varying use of the equipment.

This is the largest privately owned telephone system in the state of Wisconsin.

There are other services which are rendered by divisions of the electric distribution department. The pole crews of the electric company, in addition to performing services for
4751 the electric company, set poles for the Transport Company. The service can be performed at a relatively low cost because trained personnel and special equipment are maintained by the electric company.

The providing of duplicate facilities by the Transport Company to perform this work would very substantially in-

—2,091—

crease the cost to the company. The electric company also receives an advantage from this joint operation in that the additional work tends to spread the fixed operating items of
4752 expense and provide more work for the pole crews.

The line crews of the electric company assist the crews of the Transport Company in stringing of railway overhead feeders at times when the Transport crews have more work than can be performed within the alloted time. The furnishing of this service by the electric company makes it possible for the work of the Transport Company to be kept up to schedule without the hiring of additional employees for short intervals of time.

In many instances employees capable of performing the type of work required by the Transport Company are not

available except in the electric company. Several instances other than those previously mentioned in which the Transport Company performs services for the electric company can now be given.

The Transport Company crews performing trolley maintenance work observe the transmission lines located on the right-of-way and report conditions requiring attention. Transmission lines located on the right-of-way are the property of the electric company. This service is of material advantage to the electric company for corrective measures can 4754
be taken before a serious situation develops or outages occur.

The Transport Company's overhead crews operating in the northern division perform minor maintenance and con-

—2,092—

struction work on the electric company's transmission, distribution, signal and telephone systems located on the right-of-way. Performance of these services by the Transport Company employees is advantageous to both companies in that it provides a better load factor for the Transport Company crews and eliminates the necessity for additional personnel on the part of the electric company. 4755

The result of this joint operation is a lower cost to both companies. The signal crews in the Transport Company, in addition to maintaining a feeder system, perform some maintenance operations on the telephone system of the electric company in the outlying locations.

Just at the present time the Transport Company is completing a change of the so-called Eight Street line from rail service to trolley bus service and there is a stretch of some eight miles of this duplicate overhead trolley that has to be

placed on each side of the street. That is a tremendous job and the electric company in such instances helps out with any reserve forces that it has in that type of work. The trolley bus operations are extremely interesting and overhead trolley work for trolley buses is several times as complicated as overhead trolley work for street cars.

Q. Is there any joint use of work equipment? A. There is joint use of work equipment, heavy work equipment used on construction work performed by the companies, or on

4757 —2,093—

heavy maintenance work. It represents a substantial investment in individual items which have a poor use factor. Such equipment in general cannot be obtained as needed from an outside source on any reasonable rental basis.

It is therefore necessary for the companies to own such equipment as wheeled tractors, caterpillar tractors, air compressors, cranes, derricks, conveyors, hoists, pile drivers, concrete mixers, concrete breakers, draglines, pumps and electric shovels.

4758 Through an arrangement between the Transport Company and the electric company, each will own such equipment as is most frequently required in its work and will furnish to the other on a daily rental basis any such equipment as may be needed by the other. This arrangement reduces to a minimum the duplication of investment in the same items and classes of equipment. The arrangement also reduces to a minimum the equipment costs charged to the work of the Transport Company and the electric and heating utility of the electric company, in that the fixed charges and maintenance costs of such equipment are spread over greater

hours of use than would be the case without the interchange of equipment.

Q. Can you give us some other illustrations of jointly used property? A. I can; poles. Approximately 8,173 poles owned by the electric company are jointly used by the Transport Company. The electric company jointly uses 21.4 miles

--2,094--

of 600 volt D. C. feeder owned by the Transport Company. This figure does not include negative return. That feeder is used largely for certain 600 volt electric service customers 4760 of the electric company.

We still have quite a number of such 600 volt customers principally in the form of coal dock operators who originally bought 600 volt equipment to operate the motors on the cranes and hoists in the coal yard, because that was the best available type of current at the time.

(Discussion off the record.)

The Witness: A negative return is a return copper path for direct current which has gone out over a positive wire. An example might be this: You are 4761 all familiar with the type of street railway overhead that you find in most cities but which you don't find in Washington; up in the air is a trolley wire. That is the positive feeder. The current comes from the trolley wire down through the motors and goes ordinarily to the rails.

Now, you may have fortifying the return path of the rails to the sub-station a negative feeder which performs practically the same purposes as the rail but is frequently used in connection with electrolysis

4762 *Gould W. Van Derzee—By Respondents—Direct*

mitigation by providing another path for the current than that provided by the rail.

In the case of trolley bus systems the negative return in the second wire which is up in the air alongside of the positive feeder. In that case the current

—2,095—

goes from the positive feeder down the trolley pole, through the motors, and instead of going to the track which trolley buses don't have, it comes back up to
4763 the second wire and thence back to the station.

Q. Is there any joint use of sub-stations? A. Although sub-stations are not jointly used in the same manner as the equipment mentioned previously, that is poles and railway feeder, those sub-stations contain equipment used for the conversion of energy to the railway system. All sub-station equipment including conversion equipment used for supplying D. C. energy to the railway system of the Transport Company, are owned by the electric company.

In all there are 32 such sub-stations used in part or in
4764 whole, having a very substantial installed capacity. Although the sub-stations are owned by the electric company, employees of the Transport Company perform certain services in the operation of the sub-stations. Some of these instances will now be given?

On the coal line which runs from Lakeside plant cars are operated over such coal lines by employees of the Transport Company. These employees start and stop the operation of the sub-station in relation to their hauling operations. At East Troy, although the operation of this sub-station is automatic, the employees of the Transport Company start

and stop the operations of the sub-station by means of push-button control. The station is operated only when railway cars are being used.

—2,096—

In order that there not be any confusion in view of the fact that the testimony may show that passenger service to East Troy was discontinued sometime ago, I would like the record to show that freight service was not discontinued between East Troy and Mukwonago. There was left a short section of rail line between East Troy and Mukwonago where 4766
the Sioux line railroad enters and freight is obtained from the outside world at East Troy via the Soo Line and this remaining short section of old Transport Company track. The car operators of the Transport Company operate the push-buttons.

At Nemahbin, Oconomowoc, and Waukesha gravel pit we have sub-stations which are automatic. However, the operators of the interurban cars, employees of the Transport Company, assist in the operation of these stations by observing when they pass the station whether or not the 4767
signal light located on the outside of the sub-station is lighted. If the signal light is out this is an indication that the station is not operating and the interurban car operator reports this fact to the dispatcher.

At the Oakland Avenue sub-station under certain operating conditions this station will lock out and must be started manually. The manual starting operation is performed by car house employees who are employees of the Transport Company, upon instructions from the electric company load dispatcher.

4768 Q. Is there common use of the Public Service building in Milwaukee? A. The electric company, as owner of the

—2,097—

Public Service building, rents space in the building to the Transport Company for such purposes as passenger waiting stations, car sheds, repair pits, and division office; due to the fact that the facilities mentioned above were contained in the Public Service building prior to the separation of the companies in October of 1938, it is advantageous that joint

4769 occupancy be continued.

It would be extremely costly for the Transport Company to provide these facilities elsewhere and at the same time the electric company would suffer a loss of revenue and be in possession of additional building capacity now not needed at the present time.

One of the main reasons why the Transport Company can't move is that its tracks all converge to that point as a waiting station.

Q. Is there a common use of any other buildings and property? A. Yes, in addition to the Public Service build-

4770 ing there are other bulidings and property of lesser consequence which are used jointly by the companies. Several instances are Kinnickinnic car house and North Water Street yard.

A portion of the Kinnickinnic car house which is owned by the Transport Company is rented by the electric company. Certain garage and storage facilities of the North Water Street Yard which is owned by the electric company are rented to the Transport Company.

—2,098—

Q. Is there any joint use of right-of-way? A. Yes. Since in certain instances the rail lines of the Transport Company and the transmission lines of the electric company go in the same direction and to the same points, it is highly advantageous for both companies that a single right-of-way be used jointly by both companies. Approximately the huge sum of $3,600,000 is invested in the joint right-of-way used by the two companies.

I think we can say very forcibly that in the aggregate there are very large savings in these joint operations which 4772
give large economies to each of the three businesses which would be impossible except for the fact of common ownership.

Mr. Browning: I think we have reached a convenient point.

The Examiner: All right, we will recess until tomorrow morning at ten o'clock.

(Whereupon, at 4:30 o'clock p. m. the hearing was adjourned to reconvene at 10:00 o'clock a. m., the following day.)

4774

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

4775

Hearing Room 1102-A,
Securities and Exchange Commission Building,
Washington, D. C.,
Friday, September 27, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

4776 Appearances:

S. PEARCE BROWNING, JR., and

CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

HERMAN O'DELL,

MISS E. H. CALKINS, and

C. M. MAXWELL, Attorneys on behalf of the Securities and Exchange Commission.

—2,100—

PROCEEDINGS

Mr. Browning: I should like to have marked for identification as Respondents' Exhibit No. 41, a chart entitled, "Wisconsin Electric Power Company, Organization Chart".

The Examiner: All right.

(Chart was marked for Identification as Respondents' Ex. 41.)

4778

Mr. Browning: As Respondents' Exhibit No. 42 for identification, a chart marked, "Organization Chart, Wisconsin Gas & Electric Company", and as Respondents' Exhibit No. 43 for identification, a chart marked, "Organization Chart, Wisconsin Michigan Power Co."

The Examiner: They may be so marked.

(The two charts described were marked Respondents' Exhibits 42 and 43.)

Whereupon, GOULD W. VAN DERZEE resumed the stand and testified as follows:

4779

Direct Examination by Mr. Browning (Continued):

Q. Mr. Van Derzee, I hand you these three charts which are Respondents' Exhibits Nos. 41, 42 and 43. Were these prepared under your direction and do they correctly set forth the facts shown therein? A. They were, and they do.

—2,101—

Mr. Browning: I offer these charts in evidence as Respondents' Exhibits 41, 42 and 43, respectively.

Mr. O'Dell: No objection.

4780 *Gould W. Van Derzee—By Respondents—Direct*

The Examiner: They are received in evidence under the numbers respectively assigned them.

(Exhibits 41, 42 and 43 for Identification, received in evidence as described.)

Mr. Browning: I may say further for the record, Mr. Examiner, that I have offered these charts at the request of counsel for the Commission.

The Examiner: Yes, I recall hearing that request
4781 yesterday. Thank you.

By Mr. Browning:

Q. Are there instances of joint operations of personnel or facilities by Wisconsin Michigan Power Company? A. Yes, the executive officers of Wisconsin Michigan Power Company are charged with the general administration and supervision of the electric, gas and transportation divisions of that company. The executive and general office division is located at Appleton where many of the functions common to the gas, electric and transportation services are performed
4782 jointly by the general office employees. Joint use of the facilities provided in the general office naturally materially reduces the overhead costs incident to those operations.

I will give you a few examples of joint operation. The

—2, 3—

advertising and sales promotional group develops advertising ideas and merchandising policies used to promote the sales of gas and electric service and also merchandise in those groups. An effective but inexpensive method of advertising gas and electric service and also merchandise in

those groups is accomplished by placing advertising car cards in the buses of the Wisconsin Michigan Power Co.

The general accounting division of the company accumulates and summarizes all charges to the various operating accounts, prepares regular and special reports such as the financial and operating report, statistical reports, etc., for the gas, electric and transportation operations. This division also receives all vouchers covering equipment, materials and supplies and services purchased for use by the gas, electric and transportation divisions, verifies the charges and 4784
issues the checks in payment for all such purposes.

The payroll accounting group performs all time-keeping functions, prepares payrolls and payroll distributions, and issues payroll checks for all of the employees engaged in the gas, electric and transportation operations. The employees' records are also kept by this group. The joint performance of payroll operations results in lower costs for the electric, gas and transportation systems in that all duplication of personnel, records and equipment are eliminated.

—2,103—

The centralized typing and stenographic group performs 4785
all typing and stenographic work incident to reports and correspondence and data prepared by all divisions in the general office group.

Telephone and switchboard operaters handle all incoming, outgoing and internal calls for all three divisions of the company, thus effecting some economies that would not be present if each were separate and each had to have a telephone operator and local switchboard.

Employees of the general engineering division are engaged mainly in laying out and preparing working drawings for the

construction and maintenance of the electric distribution and transmission system. They also handle any construction and special projects for the manufacture and distribution of gas. A testing laboratory which is a part of this division makes analyses of coal, which is to be used for both the electric and the gas business. It is not the same coal, however, that is used for the production of steam that is used in the gas business. Separate testing laboratories for analyzing such coal would naturally cost more, both from the stand-
4787 point of labor involved and the necessity for more equipment.

Smoke and dust analyses at both the electric generating plant and the gas production plant are also made by the one chemist who operates the one laboratory.

The general engineering division also does blueprinting and duplicating and lettering for all the utility services. The

—2,104—

fact that these facilities are used jointly results, we believe, in lower costs.

There is also a greater load factor on the smaller division that does this work than would be possible if there were three
4788 separate divisions doing this work.

We have a property records division. It analyzes all work orders and retirements and distributes the cost of materials and labor to the capital accounts of the gas, electric and transportation systems. This group also maintains the proper records of each of the operating divisions.

The map records of both the gas and electric systems are also maintained in that division. We have a purchasing and storage department in Wisconsin Michigan Power Company at Appleton. Services performed by this division embrace

4789

purchasing and store-keeping operations and are performed for the electric, gas and transportation systems.

Obviously the elimination of dupuicate facilities which would exist if each of these systems performed their functions individually results in a lower cost for each. The delivery of all gas and electric appliances is also handled by this group.

If Mrs. Jones, alongside of Mrs. Smith, wants a gas range, while Mrs. Smith wants an electric toaster, one truck will accomplish the same delivery.

4790

We have a customers' accounts division in the southern

—2,105—

division of the company and this southern division figures, prepares and proves both gas and electric service and merchandise bills rendered to the customers. This is a joint operation, that is one billing is prepared for each customer, covering both gas and electric service and gas and electric merchandise.

A substantial saving in the cost of preparing customers' bills is thus effected by this joint process, in that only one addressograph operation is necessary and only one bill is handled in the machine, billing and proving operation. The collectors interview both gas and electric customers in an attempt to collect delinquent accounts. A saving is effected by this arrangement since it is necessary to have only one interview with the customer.

4791

Tellers located at the various company sales offices accept payment for both gas and electric service and merchandising bills. In addition to the collection work the tellers also receive service applications, disconnection orders

4792 *Gould W. Van Derzee—By Respondents—Direct*

and change of residence orders for both gas and electric service.

The cashier of the company receives and audits all collections for gas and electric services and merchandise accounts made by the tellers and collectors, as well as all fares collected in the transportation business.

—2,106—

We have a merchandise sales division in the southern division of Wisconsin Michigan Power Co. The merchandise
4793 sales force displays, demonstrates and sells both gas and electric equipment and appliances on customers' premises as well as at the company's sales offices. Joint use of these sales facilities results in a saving in the cost of merchandising which would not exist if the gas and electric equipment were sold by separate companies and salesmen.

The merchandise sales division also employs several inspectors and service men whose duties are to inspect periodically and make minor adjustments to both gas and electric appliances purchased by the customers.

In the southern division of Wisconsin Michigan Power
4794 Co., there is an electric distribution department. This department maintains a carpenter shop which is jointly used by the gas and electric utilities and the transportation system. Repair work on transportation business as well as the building and special equipment and repair work for gas and electric utilities is performed in this shop.

Considerable saving results from this joint use of personnel, buildings and equipment. The reading of gas and electric service meters in the communities where both services are available is one of the most evident instances of joint operation being a saving. A substantial saving in the cost

of rendering service bills is effected by this arrangement in that only one trip to the customer's premises is required. Due to the fact that only one bill is issued to the customer for both gas and electric services, a similar saving is effected

—2,107—

in the bill delivering.

We have a power generation department of Wisconsin Michigan Power Co., in the southern division. The plant maintenance men perform all maintenance operations such as repairing and cleaning mains and other plant equipment 4796
in the gas plant as well as in the electric plant. A machine shop is a part of this division and is used to build special equipment, and to repair equipment for both the electric and gas utilities and transportation system. Again, the elimination of duplicate facilities through joint operations results in lower costs.

The only gas distribution department of the company is that which is in the southern division. No gas is sold in the northern division. The gas meter men in the Neenah district perform electric meter connections and disconnections as well as gas meter work. This arrangement results in 4797
improved operating efficiency, since it is not necessary to send an electric meter man to this district to take care of the small volume of the daily work.

The gas distribution department operates a blacksmith shop where repair and welding work are performed for the transportation buses in addition to repairing of tools, material, welding and the building of special equipment for gas and electric operations.

We have a transportation department in the southern division. This department maintains a garage where gas

4798 and electric utility vehicles are housed, serviced and re-

—2,108—

paired, as well as the transportation department buses. This joint use results in operating economies in that special facilities for the repair and housing of vehicles of each utility and the transportation department are not necessary.

Bus operators are frequently used to perform work in the general storeroom in a period between rush hours in order to utilize their time instead of paying minimum wages
4799 under the contract which we have to do whether there is certain transportation work or not.

Q. Will you now give us the instances of joint operation by Wisconsin Gas & Electric Company? A. In view of the fact that Wisconsin Gas & Electric Company furnishes utility services in a wide area where there are many small cities and communities, joint operation of two or more services makes possible many economies and better service than would exist if each service were performed separately. Duplicate office space and personnel would definitely increase the cost of each service over present costs.

4800 There are a number of divisions which I will now describe in Wisconsin Gas & Electric Company where there are instances of such joint operation. The officers and executives of Wisconsin Gas & Electric Company form the policies and manage the operations of the entire company which includes the electric, gas and heating utilities and the transportation system.

—2,109—

The background required for management of each utility operation is usually entirely useful in the operation of

another. Thus the management of all utilities of the Wisconsin Gas & Electric Company, by a single management group, makes it possible to administer the affairs of the company in a more efficient and effective manner than would be possible if each of the utility services were carried on by a separate corporation.

It so happens that in a few of the communities served by gas through Wisconsin Gas & Electric Company an associated company, the Wisconsin Electric Power Co., furnishes electric service. The relation of these two companies has 4802
made it possible to eliminate duplicate office facilities and personnel by having the one company use jointly the facilities of the other.

Whichever company can more economically perform the services of the other is given the work to do.

That relationship just described is more definitely covered by testimony in connection with the joint functions in the city of Racine, where Wisconsin Electric Power Co. does the electric service business and Wisconsin Gas & Electric Company the gas business, and because of the fact that the home office of the Wisconsin Gas & Electric Company is at Racine 4803
it takes the lead in doing the joint operation for compensation at rates and on a basis previously described.

The general accounting department accumulates and summarizes all charges for various accounts of the gas, electric and heating utility and the transportation system. This

department assembles data for and prepares various types of reports such as financial and operating reports, statistical reports and reports required by the various government agencies.

4804 The general accounting department receives all vouchers for materials, supplies and services purchased by the various utilities in the transportation department, ascertains the correctness of the charges and issues the checks in payment therefor.

The stores accounting group maintains and posts to the stock record cards all receipts and disbursements of materials, merchandise and supplies for the gas, electric and heating utilities and the transportation department. This
4805 group also prices, extends and obtains the cost of all merchandise, materials and supplies disbursed, prepares the journal entries of material charged to the various accounts, and maintains a running inventory of all materials and supplies which have been purchased for the three groups.

Performance of these joint operations by a single group results in lower costs for each utility and the transportation property than would be the case if these services were performed separately by each utility and by the transportation department. The lower costs are due to the elimination of duplicate personnel, records, equipment and office space.

4806 The pay roll accounting group performs all types of timekeeping and pay roll operations for the electric, gas and heating utilities and the transportation department.

—2,111—

This group also maintains employee record cards, prepares and maintains earning record cards for all employees of the company. In the preparation of pay roll checks an addressograph machine is used which materially reduces the time and cost of performing the work. Inasmuch as this machine is also used for the preparation of gas and electric service bills, the resultant joint use increases the load factor

of the machine and lowers the cost of all addressograph work performed.

The auditing and developing group audits gas, electric, heating and transportation accounts. This group also audits the funds of the cashiers and the transportation station clerks. One of the functions of this group is to develop procedure, relative to customer accounting practices of the gas, electric and heating utilities.

We have a general engineering department of the Wisconsin Gas & Electric Company which is located at Racine. 4808
Services performed by this department cover electric, gas and heating utilities, and the transportation system as their needs arise and embraces such operations as development work on new projects, the preparation of orders covering construction and maintenance work, and formulation and issuance of job specifications relative to gas, electric, heating and transportation work.

This group is also responsible for the standardization of construction of electric and gas mains throughout the company's territory.

—2,112— 4809

In view of the fact that the performance of this engineering work requires specially trained and experienced personnel, and also in view of the fact that many of the engineering problems relative to the one utility directly affect one or more of the other utilities, it is inconceivable that engineering services could be performed separately by each utility and the transportation department without a great sacrifice in operating economy and efficiency of operation.

Mr. Browning: Read that last sentence back, please.

4810 *Colloquy*

(Testimony indicated was read back.)

The Witness: The property record group analyzes all work orders and maintains property records for the electric, gas and heating utilities of the transportation system.

The drafting group prepares all sketches and layouts and detailed drawings for construction and maintenance work for the gas, electric and heating utilities of the transportation division.

4811

The blueprinting and photostatic group makes blueprints of maps, reports and drawings and photostats of letters, legal reports, and records required by the various departments of the company. This joint performance of blueprinting and photostating operations permits of a greater load for the equipment and results in a smaller unit cost of production.

There is a general sales division of Wisconsin Gas & Electric Company located at Racine.

—2,113—

4812

The sales promotion group develops methods of merchandising the several services of the company and sees to it that these methods are properly executed by the salesmen in the sale of gas and electric services.

We also have the purchasing and stores department which is centralized at Racine. The purchasing group performs the purchasing services for the gas, electric and heating utilities and the transportation department. These services embrace the obtaining of price and quantity quotations, preparation of purchase

4813

orders and following the transaction through to completion. Since the efficient performance of purchasing operations requires experienced personnel, it would be a very costly duplication if each utility had to have a separate purchasing department.

The office service division of Wisconsin Gas & Electric Company at Racine types all reports, letters, forms, orders, stencils, and other material for the executive and general office departments located in the general office building.

4814

Since these departments perform joint services for the gas, electric and heating utilities, and the transportation department, it follows that the office service division also performs joint services.

The operation of a centralized typing group is most efficient when the work load factor is maintained at a high level. The fact that this division performs typing work for all departments makes it possible to

—2,114—

have a reasonably high load factor and to obtain unit costs that are low.

4815

The addressograph group performs services for the three utilities in the transportation department. These services include addressographing the bi-weekly and monthly pay roll distribution sheets and pay roll checks for all employees of the company.

This group also addressographs the gas, electric and steam bills for all division offices except for West Bend. At that point they have a post card type of billing which uses its own particular type of machine.

4816 *Colloquy*

The performance of addressograph work for joint utility and transportation offices makes possible the economical use of the expensive addressograph equipment.

The stationery stock group has charge of receiving, storing and disbursing of all forms and stationery supplies for the company.

We have certain division offices. The area served by the company being spread out over so many com-
4817 munities in southern Wisconsin has made it economical to divide the territory into four main divisions. Each division has a manager who is responsible for all utility operations in his territory that are not performed by the central offices.

Later on in my testimony we will tell more in detail about the division offices and the district offices, and describe to you fully just how Mrs. Smith gets

—2,115—

electric service in a small community.

In this connection it should be understood that
4818 while there is duplication of certain functions in each territory, the following description will deal with the joint operations of the utility in each division.

The stenographers and typists perform services for all utilities in the division in which they are located. The services embrace such operations as typing letters, forms, cutting stencils, filing correspondence, etc.

Customers' accounting division figures bills, proofs and balances service and merchandise accounts for the gas and electric utilities. Where a customer has both gas and electric service the charges for both services

are placed on a single bill. Some advantages which accrue from this joint billing procedure include: only one bill being needed; one addressograph plate necessary; only one bill needs to be addressographed; there is less machine and labor cost per account in billing and the unit cost per account in proving is lower.

When a customer has both gas and electric service the meter reader obtains both gas and electric readings when on the premises. As a customer, you know that it is very discouraging to have men appear a num- 4820
ber of times from a company on different operations and the more that can be done in one operation and the less visits, the better the customer likes it, so there is a public relations aspect to this problem of meter

—2,116—

reading which I am describing primarily as a joint operation which reduces unit costs.

Similar savings are realized in the delivery of bills, since one bill covers both gas and electric accounts.

The storeroom in the division takes care of the receiving, storing, handling and disbursing of equip- 4821
ment, materials and supplies for the gas, electric and steam utilities. That applies in the one division where there is the steam utility, and in other divisions where gas and electric alone are supplied you have the benefit of the joint operations naturally applied to the two services.

A great deal of duplication and loss of economy would result if these services were performed separately for each utility. The cashiers in the divisions receive payment for gas and electric services, mer-

4822 chandise and appliances. A saving in labor cost is effected by having the payments for all utilities collected by one group of employees.

The collector interviews customers having both gas and electric service in an attempt to collect delinquent accounts. This collection service, as distinguished from the one just mentioned under cashiers, applies to collectors who go out in the field on delinquent accounts.

4823 A saving is effected by this arrangement since it is necessary to make only one interview to collect both accounts.

—2,117—

Service applications for service or change of address orders for both gas and electric services are handled by the same people.

In the local offices in the divisions the showrooms display both gas and electric appliances and merchandise. Company salesmen sell both gas and elecrtic service appliances and merchandise which unques-

4824 tionably makes for better merchandising in the smaller communities.

Employees of the division distribution office work in conjunction with the general engineering office in scheduling work to be done, in standardizing methods of construction, and in the installation of all utility services and equipment. The stabilization of employment and higher annual earnings per employee are possible through such an arrangement.

Service to the customer is improved when the trouble men who perform customer service operations

are trained in all types of work. Fewer trucks are required and less time is wasted when a trouble man can be dispatched to take care of either a gas or electric trouble call.

The joint performance of gas and electric service operations makes for better service to the customer and reduces costs to the company in the form of reduced personnel.

In one of the communities, Waukesha, where gas and electric service is furnished, we have previously 4826
indicated to you in the testimony that downtown steam service is available. Employees trained in the

performance of gas operations can readily perform steam heating operations, thus eliminating the necessity of having to maintain a separate group of specially trained employees just for the steam heating work.

In addition to using the steam generated at the Waukesha power plant for steam heating purposes, such plant is used to supply steam for the gas holders 4827
during the cold weather, thus eliminating the necessity for the gas utility to provide a separate source of water heating.

In the city of Kenosha exists the only transportation division of Wisconsin Gas and Electric Company. In this case linemen who string wires for electric service use the same skills in maintaining the railway overhead and distribution system. This is a trolley bus system, having the duplicate overhead trolley that I described yesterday.

4828 The accounting operations relating to transportation operations are performed with resultant economies to each. The building used for the housing and repairing of transportation vehicles is also used for gas and electric vehicles.

The garage employees repair and maintain vehicles used in the operation of both the electric and the gas utilities and the joint use of storage and repair facilities reduces the amount of property investment
4829 and effects operating economies by eliminating both duplicate facilities and personnel. We are certain that there are important operating economies in all of our companies resulting from three executive officers

—2,119—

common to each.

There are not only obvious economies but the fact is that the Transport Company, Wisconsin Gas & Electric Company, Wisconsin Michigan Power Co., and Wisconsin Electric Power Company could not afford to pay the real value of the consulting services of
4830 the common officers.

Q. In addition to common general executive officers, the organization charts also show other common officers. I believe that the secretary and treasurer is common to all companies, and that some, if not all, of the assistant secretaries and assistant treasurers are common to all companies. Does that also result in economies? A. That does result in a very definite and entirely obvious economy. I did not include those you have listed because the general executive officers, as we think of them, would not always include such officers.

 4831

Q. Is the problem of obtaining capital an important one in the public utility business? A. It is extremely important. There are few businesses in which the problem of obtaining new money to maintain and extend services is as extensive as in the public utility business. In this field the extension of electric service facilities has been most marked.

In the two decades following 1910 tremendous demands for capital to finance the rapid growth in number of customers were experienced. In the last decade where there has 4832

—2,120—

been a moderate increase in the number of customers the principal need for increased electric service plant has arisen from the expanded use of electric service in all fields of application. Some of this increased use has been due to the introduction of electric service in new fields. Some of it has been due to increased use in old fields, and some of it has resulted from the ability to do things better electrically that have heretofore been performed by other methods and other fuels.

There has been a tendency in recent years towards increased costs in operating equipment. A turbo-generator recently purchased by Wisconsin Electric Power Co., for example, cost us over 45 per cent. more than the identical machine purchased in the year 1930. Similar comparisons can be made with many other items entering into the plant of an electric utility and in the case of increased capital requirement depreciation reserve funds have been entirely inadequate to cover even temporarily the needs for new capital, even though the depreciation has been set up on an entirely adequate basis. 4833

4834 *Gould W. Van Derzee—By Respondents—Direct*

At best the use of depreciation reserve funds to finance the current growth of the property is only an expedient because some day the property for which these funds are set up will wear out and you will have to have the capital to replace it.

Many problems of financing are peculiar to the utility industry. For example, the investment required in the electric utility is very substantial in relation to the annual rev-

—2,121—

4835 enues derived from the sale of electricity. About $5.00 of invested capital is needed for every dollar of operating revenue obtained from the customers of the electric utility. This factor, it may be said, is inherent in the business and will always be with us unless some very revolutionary methods are discovered which will cheapen the process of generating electricity from the power in coal and falling water, and particularly change the method of distribution which requires a complete metallic circuit from the terminals of the generator to every electric appliance throughout the whole territory.

4836 Also the utility must hold itself out to serve all customers on demand. It cannot pick and choose if for some reason it is not convenient to get the capital required to make the extension. This means that it is thrown into the financial market for capital many times when the markets are not favorable to the obtaining of capital.

Just compare this situation with that which confronts other types of private industry. A chain store or a department store, for example, may turn over its capital, and does turn it over, many times a year. If it does not wish to carry a certain line of goods it ceases to carry such goods, even

4837

though the customers come frequently and ask for that particular type of article. Extensions of plant can be made solely at the discretion of the management of a department store at times when capital can be obtained on the most

—2,122—

favorable basis.

There is no customer who can go into a department store demanding delivery of certain goods who can force the department store to carry such goods and to effect such delivery if the owner does not want to make delivery of that type of article.

4838

In this connection it is interesting to note that the electric utility business is the only business in which the product or service is ordered, manufactured and delivered at one and the same instant. If the customer wants toast for his breakfast at his home 50 miles from the power plant, there must be whirling generators at the plant, a continuous metallic circuit underground through the streets and through the rural territory, without a single break from the terminal of the generator to the toaster cord. He snaps the switch of the toaster which is his way of placing an order for the specific delivery of service. Before the click of the switch has died away the order has been flashed to the generator, the electricity has been manufactured and the toaster coil begins to heat.

4839

The process must be continuous to give satisfaction to the customer. There is no storing of electricity possible for such purposes. The plant must be of size to handle these instantaneous demands, no matter where they come from or their magnitude, and it is in connection with that condition that we find very large demands for capital to finance the huge

investments necessitated by the peak demands and that brings with it these intricate financial problems to make

—2,123—

financing such an important matter in this business as compared with others.

Not the smallest of the problems in the field of utility financing is laying out a long-term financial plan and being able to follow it. In the case of Wisconsin Michigan group we have attempted to outline over a period of years programs
4841 adequate to meet the constant requirements of the companies for new capital.

For example, Wisconsin Electric Power Co., adopted several years ago a plan for financing extensions to the East Wells Street power plant and the Commerce Street power plant. We thought that we had provided adequate capacity to take us well through 1941, but you know what happened. The preparedness program of the Government made it necessary for all of the utilities to give careful consideration to being able to meet all expected demands and some emergency demands that might be necessary in the national defense,
4842 and so there we were with that problem on our hands.

We decided that in the public interest we should order another 80,000-kw. turbine for an extension to the Port Washington plant known as Port Washington No. 2. We did that even though the financial media have not as yet been worked out to carry through the development.

This project would not have been undertaken were it not for the advice and the encouragement of The North American Company which, during a long history of growth of the

—2,124—

Wisconsin Michigan group has, on many occasions, furnished the necessary backing.

Q. Have the companies in the Wisconsin Michigan group had any difficult financing problems over the years? A. The Wisconsin Michigan group and particularly The Milwaukee Electric Railway & Light Company, have had many difficult financial problems down through the years. Obtaining the necessary capital has been a constant struggle as I will show, but we executives in Milwaukee have never had the type of worry which the public utility executives would ordinarily 4844
have. In effect The North American Company, over the years, has been our financial backer and as a result we have been freer to devote our major attention to other phases of the business.

Our unusual technical achievements can, in part, be attributed to the fact that we have been left so free to concentrate on the operating side of the business.

The financial history of the companies illustrates graphically the progress in the industry. Constant building up and putting inefficient small companies together to make large efficient coordinated units which can give better service at 4845
lower costs is an example. This growth is not completed.

Before going into the history of finance of these companies, it might be well to get the perspective that comes from looking at the first evidences of service of different types that we had in the Milwaukee area.

—2,125—

I will give you a little description of the first street railway that we had in Milwaukee. It was known as the River and Lake Shore Railway Company. It was the first to provide street railway transportation service in the city of Mil-

4846 waukee. A franchise was granted to this company September 24, 1859 permitting it to construct and operate a street railway upon whatever streets it chose from Walker's Point bridge to the Sisters' Hospital at North Point. That is a distance, I would say, of about two miles.

The Milwaukee Sentinel of May 31, 1860, makes this rather short comment:

> "Yesterday afternoon about five o'clock two cars of our street railway company, drawn by four horses
4847 each, started their first trip from Walker's Point bridge to Division Street."

Apparently the horse car business in those days was not very profitable because a history written by one John G. Gregory, makes this comment about the horse car line that we just discussed: It says,

> "Money was scarce and the undertaking did not pay. In 1869 the franchise and all of the rights and property of the company were sold to Issac Elworth, who took up the lines on the east side and relaid them
4848 on the west side, on West Water Street, from which in time extensions were constructed to Reed Street on the south and Third Street on the north."

Although it appears that the River and Lake Shore Railway Company was the first company to operate street railway service in Milwaukee, the following are a few brief comments relative to the Milwaukee City Railway Company:

The company was incorporated on March 28, 1865. The Council, taking its cue from the general feeling of the public,

as it usually does, was ready to grant them permission to pick out their right of way and lay tracks to their heart's content. The company, however, found scanty profit in the transportation business and sold out to Mr. Elworth at the time he purchased the property of the River and Lake Shore Railway Company.

The record shows that both horses and mules were used to draw the cars in this early period. The record further indicates that the West Side Street Railway Company preferred the use of horses, whereas the Cream City Railway 4850
Company preferred the use of mules.

Another type of motive power for cars was steam power and the record shows that in 1875 a steam-operated road called the Forest Home line was built and operated, using a steam engine for motive power.

A few years later, in 1878, this line was purchased by the Cream City Railroad Company which company discontinued the use of steam power and substituted horses.

The first experiment with electrically-operated cars in the city was on The Milwaukee Cable Railway Company line, more commonly known as the Hinsey Line. The first experi- 4851
—2,127—
ment took place in 1889. This experiment, however, did not prove to be a success.

—2,128—

The West Side Street Railway Company, more commonly known as the Becker Line, was the first company to equip its cars for electric operation and continue this type of operation.

The first electric car of this company operated on Grand Avenue in Milwaukee in April 1890. Probably no descrip-

4852 tion of the various forms of motive power in the early days of transportation would be complete without another example.

This is an example of duplicate forms of motive power on one car where one form was not so much in the nature of a reserve, actually, as it was in the nature of a psychological experiment.

This peculiar transportation combination, viewed by a horse approaching down the street would seem to be a phe-
4853 nomenon in which a train of cars was drawn by two effortless mules mounted on a flat car, but the more observant person on the sidewalk would see that black smoke was issuing behind the mules and discover that this was a steam engine with two mules in front.

It so happened that as time went on, the effect of weather and rain and seasons began to get in their work on these two stuffed mules, which were placed on the flat car, obviously to prevent the scaring of horses and the subject was taken up very deliberately by the Common Council of the City of Mil-
4854 waukee and in the year—I think it was in the early '70's, Common Council proceedings after a very definite controversy showed a resolution which directed the company forth-

with to do one of two things, either remove the mules entirely or get busy and restuff them.

So we see that there is a lot of experimentation, financing losses and amusement in connection with the attempts to meet the whims of the traveling public in the early days.

Q. When did the first electric light company start in Milwaukee? A. Although a number of companies preceded

4855

the Badger Electric Illuminating Company in making application for receiving a franchise from the Milwaukee Common Council, the Badger Company was the first to start operations as an operating utility.

A private plant owned by S. S. Badger was installed in the exposition building, the forerunner of the present Milwaukee Auditorium, and operated one circuit of fifty arc lamps for demonstration and exhibition purposes.

By July 20, 1885, Mr. Badger was ready to expand his venture for on that date the Badger Electric Illuminating 4856
Company was incorporated and on the same day a franchise was requested from the Common Council.

On November 21, 1885, the franchise was obtained and the company immediately began serving commercial customers and street lamps.

The Examiner: Let us have a short recess at this point.

—2,130—

(Whereupon a short recess was taken.)

4857

By Mr. Browning:

Q. When was Wisconsin Electric Power Company incorporated? A. Wisconsin Electric Power Company as presently constituted was incorporated January 29, 1896, under the laws of the State of Wisconsin, as The Milwaukee Electric Railway & Light Company, having succeeded to the property of The Milwaukee Street Railway Company following a foreclosure sale on January 29, 1896, when the property was acquired by a purchasing committee and transferred by it to The Milwaukee Electric Railway & Light Company.

4858 *Gould W. Van Derzee—By Respondents—Direct*

Q. Now, will you tell us briefly about the predecessor companies and systems of Wisconsin Electric Power Company? A. The Milwaukee Street Railway Company was incorporated on December 22, 1890, and purchased at various times between that date and December, 1893, the properties of the following companies located principally within the limits of the City of Milwaukee.

The Milwaukee City Railroad Company, incorporated December 1, 1888, purchased by The Milwaukee Street Rail-
4859 way Company December 22, 1890, was, itself, the successor of The Milwaukee City Railway Company, incorporated March 28, 1865, by special act of the legislature and granted franchise to operate on certain streets of the east, west and south sides of the City of Milwaukee.

The Cream City Railway Company, incorporated April 22, 1890, and purchased by Milwaukee Street Railway Company, February 19, 1891, was the successor of Cream City Railroad Company, incorporated August 18, 1874, which in turn succeeded an association consisting of F. B. Van
4860 Valdenberg, and others who had obtained a fifty-year franchise in 1874 to operate on streets on the west and south sides of Milwaukee.

The deal was negotiated by Henry Villard under contract of June 20, 1890, which contract was assigned to Villard by The North American Company on August 5, 1890.

West Side Railroad Company, incorporated June 5, 1889, was successor to West Side Railway Company incorporated December 17, 1888, which in turn succeeded the West Side Street Railway Company, incorporated July 29, 1875, and

which, likewise, succeeded to an association of J. H. Tesch, John Plinkinton, et al.

The company operated on the west side of the City of Milwaukee. The entire capital stock of West Side Railroad Company amounted to $300,000.00, was purchased by North American Company from Washington Becker on September 29, 1891, and in turn sold by The North American Company to Milwaukee Street Railway Company on November 25, 1893.

The Milwaukee and Whitefish Bay Railway Company 4862
incorporated May 24, 1886, was acquired by Milwaukee Street Railway Company of New Jersey, through purchase
—2,132—
of 2,196 shares of capital stock of a total capitalization of 2,400 shares, from Charles Pfister, under contract dated June 1, 1891.

The Milwaukee Electric Street Railway Company, incorporated July 10, 1893, was successor to Milwaukee Electric Railway Company, incorporated December 19, 1889, which in turn succeeded through Mr. Charles Pfister to the Milwaukee Cable Railway Cowpany, incorporated May 26, 1887, 4863
operated on certain streets in the third ward of the city, purchased by Milwaukee Street Railway Company of New Jersey, from Mr. Pfister on June 2, 1894.

The Edison Electric Illuminating Company, incorporated August 20, 1889, was established by the Edison General Electric Company of New York and purchased by The North American Company on January 31, 1890. Property transferred by The North American Company to Milwaukee Street Railway Company for stock and bonds.

The Badger Electric Illuminating Company, incorporated July 20, 1885, was originally purchased by Henry Villard

4864 from J. A. Hinsey on June 18, 1890, the contract subsequently assigned by Mr. Villard to The North American Company on July 7, 1890, sold to Milwaukee Street Railway Company by The North American Company on December 22, 1890.

The property, entire capital stock, and $30,000.00 of bonds of The Milwaukee Electric Light Company were purchased by The North American Company on October 8, 1890

4865 from Charles A. Brown of Chicago.

The company was incorporated in Illinois on June 9, 1889.

In subsequent years, the operations of The Milwaukee Electric Railway & Light Company were expanded through the acquisition by purchase or merger of the properties and businesses of various other public utility companies, the principal amount of which were the Milwaukee Light, Heat & Traction Company, North Milwaukee Light & Power Company, Wells Power Company, and the Milwaukee Northern Railway Company.

4866 The Milwaukee Light, Heat & Traction Company, incorporated December 14, 1896, was purchased by The Milwaukee Electric Railway & Light Company at a cost of $13,240,987.28. The consideration paid by The Milwaukee Electric Railway & Light Company consisted of $1,600,000.00 par value of common stock of The Milwaukee Electric Railway & Light Company, $864,150.20 cash or equivalent in notes and the assumption of the indebtedness of The Milwaukee, Light, Heat & Traction Company, amounting to $10,776,837.08.

4867

The amount of common stock of The Milwaukee Electric Railway & Light Company, issuable to Milwaukee Light, Heat & Traction Company as part of the purchase price, in amount of $1,600,000.00 was reduced to $1,400,000.00 by order of the Railroad Commission of Wisconsin in its order of November 28, 1922, the difference of $200,000.00 eventually being transferred to depreciation reserve.

—2,134—

4868

The Railroad Commission of Wisconsin was the predecessor of the present Public Service Commission of Wisconsin. Milwaukee Light, Heat & Traction Company had title to the traction, lighting and heating properties serving an extensive territory to the south and west of the City of Milwaukee, the principal communities served being the cities of Racine, Cudahy, South Milwaukee and West Allis and the villages of Shorewood and Whitefish Bay.

Its transportation properties extended to the cities of Racine, Kenosha, Burlington, Waukesha and Watertown and it rendered local transportation service in the City of Racine and in the suburban communities immediately surrounding the City of Milwaukee. It acquired at various times, properties and businesses of a number of smaller companies, to wit: Pabst Light, Heat & Power Company, incorporated in 1896, was acquired February 15, 1897, for $678,805.61, consisting of cash, bonds, real estate and a mortgage note.

4869

A portion of the property consisting of a power house, lighting distribution system and underground steam heating tunnels was transferred in 1899 to The Milwaukee Electric Railway & Light Company for $300,000.00.

The remaining portion consisted of Wauwatosa Railway and extending from 27th and Walnut Streets in Milwaukee

4870 *Gould W. Van Derzee—By Respondents—Direct*

to Wauwatosa and a power house and lighting system in the town of Wauwatosa.

—2,135—

The Milwaukee and Wauwatosa Motor Company, incorporated October 24, 1888, purchased December 9, 1897, consisted of a steam dummy line, operating from 36th and Wells Street in Milwaukee to Wauwatosa and from 59th and Wells Street to North Greenfield.

The Waukesha Beach Electric Railway comprised five
4871 miles of track from Waukesha to Waukesha Beach, a power plant at Waukesha and some six or seven cars.

This company was incorporated August 27, 1894, and purchased by Milwaukee Light, Heat & Traction Company in 1897.

The Milwaukee, Racine and Kenosha Electric Railway property consisted of thirteen miles of line from South Milwaukee to Racine and ten miles of line from Racine to Kenosha, together with machinery valued at $30,000.00 installed in the power house of Belle City Electric Railway in Racine.

The company was incorporated August 8, 1896, and ac-
4872 quired in 1897 for the sum of $129,308.76. The Belle City Electric Railway property consisted of 13½ miles of street railway system in the City of Racine, a power house and two car houses, all of which were acquired in 1899, through the purchase of outstanding stocks and bonds for $299,120.70.

The company was incorporated July 31, 1897, having succeeded to the property of Belle City Street Railway Company which was incorporated June 1, 1883.

—2,136—

The Badger Electric Company, an electric lighting utility doing business exclusively in Racine, owned a power

house and electric line construction. It was incorporated October 28, 1884 and acquired in 1899 for the sum of $144,586.91.

The Milwaukee and Waukesha Electric Railway Company was acquired largely for its right-of-way between West Allis and Waukesha. The company was incorporated July 31, 1895, as the Milwaukee General Railway Company and the same subsequently changed to Milwaukee and Waukesha Electric Railway Company on June 16, 1896.

It was acquired in 1899 for the sum of $133,000.00. The 4874
South Milwaukee Electric Light & Power Company was incorporated January 13, 1898, and purchased in 1899 for $15,000. Its property consisted of a power plant and lighting system in the City of South Milwaukee.

The Chicago, Waukegan and North Shore and the Chicago, Kenosha and Milwaukee Railways were acquired in 1906 by a stock purchase for the sum of $125,487.38.

The Milwaukee and Wauwatosa Electric Company, incorporated June 8, 1891, and purchased in 1914, was successor to Wauwatosa Electric Company, incorporated March 1, 1889, and The Milwaukee and Wauwatosa Rapid Transit 4875
Company, incorporated January 19, 1891.

(Discussion off the record.)

A. (Continuing) Waukesha Street Railway Company, in-

corporated May 21, 1897, Milwaukee and Muskego Lakes Electric Railway Company, incorporated October 28, 1899, The Waukesha Electric Railway Company, incorporated May 21, 1897, and acquired through an assignment of franchise on December 28, 1897, Watertown-Oconomowoc

Light, Heat & Power Company, incorporated November 17, 1903, Hevi Duty Electric Company was incorporated November 6, 1924.

On November 2, 1925, Milwaukee Light, Heat & Traction Company acquired 1,250 shares, or 50 per cent. of the common stock of this company and again on April 27, 1929, acquired 625 additional shares amounting to 25 per cent. of the common stock.

This company manufactures and sells electric heating
4877 equipment including furnaces and water heaters and was completely described by me yesterday.

Q. Mr. Van Derzee, I don't believe you indicated the date or approximate date when The Milwaukee Electric Railway & Light Company acquired the properties of Milwaukee Light, Heat & Traction Company. I don't know that you have the date. Could you give the approximate date? A. About 1919.

North Milwaukee Light & Power Company was incorporated January 27, 1906. It furnished electric service to the residents of the then city of North Milwaukee which was
4878 annexed to the City of Milwaukee in 1928.

—2,138—

In 1911, The North American Company acquired 100 per cent. of the common stock of this company which was later acquired by Wisconsin Edison Company on December 31, 1912.

On December 31, 1921, The Milwaukee Electric Railway & Light Company purchased the physical property and assets of North Milwaukee Light & Power Company from Wisconsin Edison Company.

4879

Wells Power Company was incorporated June 7, 1907. This property consisted of power plant equipment located in a leased building in the City of Milwaukee and of electric and steam heating distribution system serving a limited area in downtown Milwaukee.

In 1913, The North American Company acquired all of the outstanding shares of $100.00 par value common stock of Wells Power Company, amounting to 2,000 shares. Subsequently, in 1914, Wisconsin Edison Company acquired this stock from The North American Company which was again 4880
transferred to North American Edison Company in 1923 and finally acquired by The Milwaukee Electric Railway & Light Company from North American Edison Company on August 17, 1925, together with Wells Power Company's outstanding 6 per cent. demand notes in principal amount of $225,000.00 for a total consideration of $700,000.00 of preferred stock, 7 per cent. series, issues of 1921, of The Milwaukee Electric Railway & Light Company.

In September, 1926, Wells Power Company was merged into The Milwaukee Electric Railway & Light Company.

4881

—2,139—

Milwaukee Northern Railway Company was incorporated in October, 1905, for the purpose of furnishing transportation service to the area north of the City of Milwaukee and extending to the City of Sheboygan.

The principal communities served were the cities of Sheboygan, Port Washington and Cedarburg. One local railway line was operated in Milwaukee. The capital stock of Milwaukee Northern Railway Company consisting of 10,000 shares of common stock, 6,000 shares of second preferred

4882 *Gould W. Van Derzee—By Respondents—Direct*

stock and 4,000 shares of first preferred stock was purchased by The Milwaukee Electric Railway & Light Company in 1922, and 1924.

In April, 1928, the Milwaukee Northern Railway Company was merged into The Milwaukee Electric Railway & Light Company.

The New Butler Electric Light Company was incorporated in February, 1915, and furnished electric service in the small village of New Butler, a small distance to the north
4883 and west of Milwaukee.

This property was acquired in April, 1920, for a consideration of $18,750.00.

Dousman Electric Light & Power Company furnished electric light and power service to the small village of Dousman located in the town of Ottawa in Waukesha County. The date of incorporation is not known. This property was purchased in January, 1923, from L. J. Bischel of Dousman for a cash consideration of $18,500.00.

—2,140—

Honey Creek Electric Light Company was incorporated
4884 in October, 1914, to furnish electric light and power service to the residents of the small unincorporated community of Honey Creek, the town of Spring Prairie, Walworth County. This property was acquired in August, 1923, from the Honey Creek Electric Light Company for a cash consideration of $3,500.00.

The utility properties of Commonwealth Power Company, Akley Land Company and Continental Realty Company were purchased in one transaction in April, 1917.

These properties, incorporated January 13, 1908, were known as Commonwealth Power Company.

The Milwaukee Electric Railway & Light Company and Wisconsin Edison Company entered into an agreement on January 31, 1917, with the Uihlein family to purchase the entire common stock and property of Commonwealth Power Company for a consideration of $550,000.00 in cash and $1,450,000.00 in ten-year 5 per cent. serial notes of The Milwaukee Electric Railway & Light Company.

The purchase price was borne jointly by The Milwaukee Electric Railway & Light Company and Wisconsin Edison Company, although the property was deeded to The Mil- 4886
waukee Electric Railway & Light Company.

The Akley Land Company property acquired, consisted of an electric generating station, including land, structure and

equipment.

The property of Continental Realty Company consisted of a boiler plant and generating equipment located in downtown Milwaukee and of tunnels and steam distribution mains and services.

The property of Commonwealth Power Company con-
sisted entirely of transmission and distribution property in 4887
downtown Milwaukee.

Central Heating Company of Milwaukee, incorporated May 17, 1912, and successor to Milwaukee Central Heating Company, incorporated in 1905, was owned by The North American Company, which held 1,000 shares or 100 per cent. of its common stock. On December 31, 1912, North American Company sold this entire stock to The Milwaukee Railway & Light Company and the property and assets of Central Heating Company of Milwaukee were merged with The Milwaukee Electric Railway & Light Company as of that date.

Property acquired consisted entirely of tunnels, mains, services, meters, and so forth, devoted to steam heating service.

Milwaukee Arc Light Company, incorporated November 18, 1893, was purchased by The Milwaukee Electric Railway & Light Company in 1897 at a cost of $107,783.32.

Milwaukee Power & Light Company, incorporated February 10, 1891, a successor to Milwaukee Lighting & Power Company, which was incorporated April 24, 1890.

4889 —2,142—

Plankinton Electric Light and Power Company was incorporated May 29, 1915, and the property purchased as of the same date, payments being spread over a period of twenty years.

The Milwaukee Electric Railway & Light Company purchased the physical property of Port Washington Municipal Electric Utility, consisting of a small steam generating station and electric distribution system serving the City of Port Washington in February, 1930.

4890 Q. Do you recall offhand the capacity of that Port Washington Municipal Plant? A. Just a few hundred kilowatts. That is the one that was operated by engineer Shaver, who has now become the chief engineer of the Port Washington Power Plant owned by the Electric Company.

Q. And what is the capacity of Port Washington, then? A. 80,000 kilowatts installed with 80,000 coming up.

Wisconsin General Railway was incorporated July 3, 1912. In December 1912, 40 per cent. of the outstanding common stock of this company was acquired by Wisconsin Edison Company. This stock was acquired from Wisconsin

4891

Edison Company by The Milwaukee Electric Railway & Light Company in January, 1917, which subsequently acquired the remaining 60 per cent. of the common stock in October, 1920.

The company operates, as described yesterday, as a real

—2,143—

estate holding company.

In October, 1938, The Milwaukee Electric Railway & Light Company merged into itself, the former Wisconsin Electric Power Company, assumed the name of that company and transferred to The Milwaukee Electric Railway & Transport Company, a new wholly owned subsidiary, its transportation business and properties, except for certain outlying interurban lines leased and operated by The Milwaukee Electric Railway & Transport Company.

4892

The former Wisconsin Electric Power Company was the owner of the Lakeside generating station which it leased to the company and did no other business.

Q. Have you made a computation to determine how many predecessor companies or systems are represented by the present Wisconsin Electric Power Company and on the transit side by The Milwaukee Electric Railway & Transport Company? A. Yes. The companies which you just named represent the putting together of fifty original companies and systems.

4893

Mr. Browning: Will you mark that chart for identification?

The Examiner: 44 is the number.

(The chart referred to was marked for identification as Respondents' Exhibit No. 44.)

4894 *Gould W. Van Derzee—By Respondents—Direct*

By Mr. Browning:

Q. Mr. Van Derzee, was this chart, Respondents' Exhibit —2,144— for identification No. 44, prepared under your supervision? A. It was.

Q. The data thereon is taken from the records of the company? A. It was.

Mr. Browning: I offer this chart in evidence as
4895 Respondents' Exhibit No. 44.

Mr. Browning: In connection with this chart, Mr.

Mr. O'Dell: No objection.

The Examiner: It is admitted into evidence under the number mentioned.

(The chart referred to was received in evidence as Respondents' Exhibit No. 44.)

Examiner, I may say that it was originally prepared simply to enable a count to be made of the predecessor companies and systems rather than with the purpose
4896 of ever offering the chart in evidence.

It shows, however, so graphically that The North American Company started corporate simplification in 1890, that I think it is a valuable exhibit.

(Discussion off the record.)

By Mr. Browning:

Q. Mr. Van Derzee, the chart bears the heading Wisconsin Electric Power Company, but the transit properties represented in these companies are now held by The Mil-

waukee Electric Railway & Transport Company? A. That

—2,145—

is a fact.

Mr. Browning: Will you please mark this chart, which consists of four sheets, bearing the title, "Wisconsin Electric Power Company (formerly The Milwaukee Electric Railway & Light Company)" as Respondents' Exhibit for identification?

The Examiner: Number 45.

4898

(The chart referred to was marked for identification as Respondents' Exhibit No. 45.)

By Mr. Browning:

Q. Was this chart prepared under your supervision, Mr. Van Derzee? A. It was.

Q. Information shown thereon was taken from the books and records of the Company? A. It was.

Mr. Browning: I offer this in evidence as Respondents' Exhibit No. 45.

(Discussion off the record.) 4899

Mr. O'Dell: No objection.

The Examiner: Very well. This exhibit, consisting of four sheets, is admitted in evidence under the number mentioned.

(The chart referred to was received in evidence as Respondents' Exhibit No. 45.)

Mr. Browning: The purpose of this exhibit, Mr. Examiner, is to show in as condensed form as possible,

—2,146—

4900 the financial history of the Company. I think the exhibit more or less speaks for itself, but I would like to ask Mr. Van Derzee if he has any comments with regard to it.

The Witness: Do all copies of this exhibit have numbers designating whether they are sheets, 1, 2, 3 or 4, of this exhibit?

The Examiner: Off the record.

(Discussion off the record.)

4901 The Witness: Sheet 1 of this exhibit, which covers the outstanding securities by classes, as at December 31, 1896 to 1939, inclusive, and as at June 30, 1940, is of interest in that it shows that the total outstanding securities have increased tremendously from 1896, where there were $14,000,000.00 to $112,869,880.00 in 1940.

It also shows some stormy periods of financing, because we note that right after the period of the first World War, up to the beginning of the last

4902 decade, the number of outstanding issues increased quite rapidly, as difficulties of financing were incurred, and then we see evidences of the company getting on top of the situation and gradually reducing the number of issues down to five as of June 30, 1940, compared with a peak of twelve in 1921.

By Mr. Browning:

Q. Have you any comments on the second sheet of the ex-

—2,147—

hibit? A. The second sheet of the exhibit relates exclusively

to the bonds outstanding as of December 31, 1896, to 1939, inclusive and as at June 30, 1940.

One of the interesting figures is the issue of $4,950,000 of refunding and first mortgage bonds. These were issued in 1921 and were out only during that year and it was necessary to have a coupon rate of 7½ per cent. and to sell them at a discount.

That was one of the stormy periods referred to, when money was very expensive, and that compares with the present issue of mortgage bonds outstanding having a coupon 4904
rate of 3½ per cent. which sold at a substantial premium.

It indicates progress of the company, improvement in its affairs, as well as the condition of the money market.

Q. Have you any idea where the 3½'s are selling today? A. Approximately 108.

Q. Have you any comments on the third sheet of the exhibit? A. The third sheet of the exhibit is devoted exclusively to history corresponding to the ones previously given on sheets one and two except that it relates to notes outstanding in the period.

Probably the most important item, as indicative of what 4905
the company had to go through to finance itself in the period

following the first World War, is the column in which are shown amounts of ten-year 8 per cent. equipment trust certificates due in 1930.

This means that the company, in effect, had to put up its equipment in order to get money. Compare that with the present outstanding unsecured promissory notes due serially in 1948, amounting to $13,250,000.00 outstanding on June 30, 1940, and bearing an interest rate of 2⅝ per cent.

4906 *Gould W. Van Derzee—By Respondents—Direct*

Sheet No. 4 covers the outstanding capital stock for the same period previously described, shows how this has increased from 1896 in the amount of $7,000,000.00 at the time of the first large consolidation, to $44,619,880.00 at the present time.

This sheet covers both common stock and preferred stock. The most interesting item is that of the 8 per cent. series. This was 8 per cent. preferred stock sold at par, as it must be, not less than par in the State of Wisconsin, and that
4907 compares with the rate of 4¾ per cent. on the series now outstanding.

(Discussion off the record.)

By Mr. Browning:

Q. Sheets 1 and 4 show a reduction in the par value of the common stock from $21,000,000.00 on December 31, 1939 to $13,959,280.00 on June 30, 1940. Was this accompanied by the creation of a surplus? A. It was. The reduction occurred in connection with the refinancing of the outstanding 6 per cent. preferred stock issue of 1921 of the company at
4908 —2,149—
which time the par value of the common stock was reduced from $20.00 to $10.00 and a capital surplus created incident thereto.

At the same time, The North American Company exchanged 20,000 shares of 6 per cent. preferred stock, issue of 1921, which it owned, for 120,000 shares of the new common stock which also had the effect of contributing to the capital surplus.

Q. These sheets, embraced within Respondents' Exhibit 45, merely give the par value of the common stock and do

4909

not give any figures with regard to surplus? A. That is true.

Mr. Browning: I have finished with this exhibit, Mr. Examiner, and it is now almost 12:30. I think this would be a good time to recess.

The Examiner: Off the record.

(Discussion off the record.)

Mr. Browning: What is the last?

4910

(Whereupon, the last above recorded was read by the reporter.)

Mr. Browning: I move an adjournment until Monday morning at 10:00 a. m.

Mr. O'Dell: As far as Commission counsel is concerned, we would prefer to continue on this afternoon, but we will not object to Mr. Browning's motion for a continuance at this time.

—2,150—

The Examiner: I think, Mr. Browning, as he has been here all week, should be allowed to return to his 4911
office and family for the week-end and we will recess at this point until Monday morning at 10:00 o'clock.

(Whereupon, at 12:30 o'clock a. m., the hearing was adjourned until 10:00 o'clock a. m., Monday, September 30, 1940.)

—2,151—

4912

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

4913

Hearing Room 1101,
Securities and Exchange Commission Building,
Washington, D. C.,
Monday, September 30, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

4914 Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, HERMAN O'DELL, and MISS E. H. CALKINS, Attorneys on behalf of the Securities and Exchange Commission.

4915

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Hamilton: Mr. Examiner, I suggest at this time that we bring up to date corrections on the record.

In order to make the corrections without disagreement as to form, I suggest that the stenographer be given a typewritten list of corrections which she can transcribe into the record and that in the original copy of the transcript, which is part of the docket in this case, the corrections be recorded with a cross-reference to the page in the transcript in which the particular change appears as part of the memorandum of corrections.

4916

Mr. Binford: As I understand it, you propose that in the original docket the corrections be made in pencil but that the errata sheets showing these corrections which will be controlling, be separately incorporated in the transcript.

Mr. Hamilton: That is right.

Mr. Binford: I have no objection to that, Mr. Examiner.

The Examiner: Very well. I think that is a very good arrangement. The stipulation that you gentlemen have just stated will be followed.

4917

Now, I imagine it would take the rest of the morning for you to work on these corrections, will it not?

Mr. Hamilton: Yes, I believe it will.

The Examiner: Very well. We will take a recess at this point until two o'clock this afternoon and the corrections

—2,153—

that are agreed upon will be incorporated in the minutes of this morning's session.

(Whereupon, the hearing was recessed at 10:15 o'clock a. m., to reconvene at 2:00 p. m. the same day.)

—2,154—

4918 *Colloquy*

AFTERNOON SESSION

(Whereupon, at 2:00 o'clock p. m., the hearing reconvened.)

The Examiner: The hearing will be resumed.

Mr. Browning: The Examiner will recall that in the course of the testimony at the last hearing, it was shown that the present Wisconsin Electric Power Company and The Milwaukee Electric Railway & 4919 Transport Company, together, represent the putting together of fifty original companies or systems and that I pointed out at that time that the process of simplification had been developed by The North American Company beginning in 1890.

In that connection and because I think it is of real interest, I would like to refer to the opinion of Judge Seaman in The Milwaukee Electric Railway & Light Company versus the City of Milwaukee, 87 Federal 577.

4920 Mr. Binford: Mr. Examiner, I object to any argument on the part of counsel at this time. I can see that no purpose has been stated for making this statement. Counsel has proceeded with this statement and made the citation of the case and I object to any further statement by him unless the purpose of such statement is first stated.

Mr. Browning: My purpose was not argument, Mr. Examiner, but merely to refer to this decision in which Judge Seaman discussed the putting together of these

companies at this early period, and the resulting advantage to the public.

—2,169—

Mr. Binford: I move that the last statement of counsel as to the contents of Judge Seaman's opinion be stricken from the record as improper at this time.

If the case in question is deemed a part of the factual material to be considered in this case, the opinion, itself, might be offered in evidence, at which time it could be examined and such objections as 4922
might be proper, if any, be made to it.

Mr. Browning: I take it that it is unnecessary to offer opinions of Federal Courts in evidence in this proceeding.

Mr. Binford: Mr. Examiner, I take it it is also unnecessary to make statements which are self-serving as to what those opinions hold in the course of taking factual testimony before a trial examiner.

The Examiner: Well, is there any doubt or any controversy between you gentlemen that the opinions need not be introduced in evidence of Federal Courts. 4923
Can't they be judicially noticed?

Mr. Binford: I don't think the question of whether any such controversy exists between us is in issue at this moment and I object to the remarks along the lines that have just been made by counsel for the Respondents and I move that they be stricken from the record as highly prejudicial. If there is a proper way, that isn't it.

Mr. Browning: Mr. Examiner, there is no reason for any controversy. All I wanted to do was to get

—2,170—

4924 into the record for convenient reference, this particular description.

The Examiner: Well, I will overrule the motion to strike.

Mr. Binford: Exception, please.

The Examiner: All right.

Mr. Browning: Off the record.

(Discussion off the record.)

4925 Whereupon GOULD W. VAN DERZEE resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

Q. Turning now to Wisconsin Gas & Electric Company, will you outline briefly for us the history of that company? A. Wisconsin Gas & Electric Company was incorporated in the State of Wisconsin on June 5, 1866, as The Racine Gas Light Company.

This company was the successor to the property and business of Racine Gas, Light & Coke Company, which was in-
4926 corporated February 24, 1855.

An earlier company, incorporated in Wisconsin, April 2, 1853, and known as Racine Gas, Light Company, is not believed to have either owned or operated any facilities for the production or distribution of gas.

Gas utility service was first supplied by Racine Gas, Light

& Coke Company in the year 1855, in the City of Racine, Wisconsin.

In 1877, Racine Gas Light Company acquired through purchase, the operating property of Racine Peoples Gas

Company, which had been incorporated in the year 1870. Prior to 1912, the property of Racine Gas Light Company was limited to a gas manufacturing plant and a distribution system serving in and about the City of Racine and Racine County, Wisconsin, and a gas transmission line connecting the gas plant in the City of Racine with the gas distribution system in the Kenosha County, Wisconsin.

September 23, 1912, the name of Racine Gas Light Company was changed to the present name of the corporation, Wisconsin Gas & Electric Company, pursuant to authority 4928
granted by the Railroad Commission of Wisconsin; Wisconsin Gas & Electric Company, on October 4, 1912, acquired the assets of the Kenosha Gas & Electric Company on October 7, 1912, acquired the assets of Kenosha Electric Railway Company.

The Kenosha Gas & Electric Company was incorporated in Wisconsin on May 26, 1900, and had as predecessor companies, Kenosha Light & Power Company, incorporated December 16, 1895; the Kenosha Electric Light Company, incorporated June 22, 1893; Electric Illuminating Company, 4929
incorporated in Illinois July 29, 1899; The Kenosha Gas, Electric Light & Fuel Company, incorporated October 22, 1888; Citizen Gas, Light & Coke Company of Kenosha, in-

corporated May 11, 1877; and Kenosha Gas, Light & Coke Company, incorporated March 28, 1856.

At the time of its acquisition by Wisconsin Gas & Electric Company, the Kenosha Gas & Electric Company operated electric and gas utilities serving in and about the City of Kenosha, Kenosha County, Wisconsin.

4930 Kenosha Electric Railway Company was incorporated April 30, 1902. At the time of its acquisition by Wisconsin Gas & Electric Company, it operated an electric street railway system in the City of Kenosha and rendered electric service to a comparatively few customers in the city.

On July 14, 1915, Wisconsin Gas & Electric Company acquired a transmission line located in Jefferson County, Wisconsin, and connecting the cities of Watertown, Jefferson, Lake Mills and Fort Atkinson, and the village of John-
4931 son Creek.

On July 26, 1915, Wisconsin Gas & Electric Company acquired the property of both Watertown Gas & Electric Company, and the Burlington Electric Light & Power Company. The Watertown Gas & Electric Company was incorporated April 27, 1905, and had as predecessor companies, Watertown Gas Company, incorporated May 22, 1862; Watertown Electric Company, incorporated in August, 1902; Watertown Electric Light Company, incorporated June 14, 1889; and Watertown City Gas Light Company, incorporated March 24, 1855.

4932 At the time of acquisition by Wisconsin Gas & Electric

Company, Watertown Gas & Electric Company rendered both electric and gas utility service in and about the City of Watertown located in Jefferson and Dodge Counties, Wisconsin.

Burlington Electric Light & Power Company was incorporated March 23, 1903. At the time of its acquisition by Wisconsin Gas & Electric Company, it rendered utility service in the city and town of Burlington, Racine County, Wisconsin.

On February 9, 1916, Wisconsin Gas & Electric Company acquired the property of the Menomonee Falls Electric Company. This company was incorporated August 1, 1907, and operated an electric distribution system in the vicinity of the village of Menomonee Falls, Waukesha County, Wisconsin.

On August 9, 1916, Wisconsin Gas & Electric Company acquired a small distribution system in the unincorporated village of Clyman, in the Town of Clyman, Dodge County, Wisconsin. 4934

On October 18, 1916, Wisconsin Gas & Electric Company acquired by purchase a small electric distribution system operated in the unincorporated community of New Lebanon, the town of New Lebanon, Dodge County, Wisconsin.

On October 25, 1916, Wisconsin Gas & Electric Company acquired by purchase the property of Campbellsport Electric Light & Power Company. This company was incorporated June 27, 1908, and operated a small electric generating plant and a distribution system which served in and about the village of Campbellsport, Fond du Lac County, Wisconsin. 4935

On January 13, 1917, Wisconsin Gas & Electric Company acquired by purchase the electric distribution system of the Jackson Electric Light & Power Company located in the village of Jackson, Washington County, Wisconsin.

The Jackson Electric Light & Power Company was incorporated September 18, 1916, and continued the electric business of the Froelich Mercantile Company, which is believed to have first rendered electric service in 1914 in the village of Jackson.

4936 On August 30 and 31, 1917, Wisconsin Gas & Electric Company acquired by purchase a number of electric systems, including Theresa Electric Light & Power Company; Lomira Electric Light & Power Company; Resseville Heat, Light & Power Company; Iron Ridge Electric Light & Power Company; an electric system in the village of Ashippun, Dodge County; Marshall Electric Light & Power Company; Thiensville Electric Light & Power Company; Eden Electric Light Company; an electric system in the village of South
4937 Germantown, Washington County; an electric system in the city of Bristol, Kenosha County; and an electric system in the village of Union Grove, Racine County.

Theresa Electric Light & Power Company was incorporated May 15, 1912, and began rendering electric service in September of the same year.

At the time of its acquisition by Wisconsin Gas & Electric Company, it served in the village of Theresa, and operated a transmission line between the village of Theresa and the City of Mayville, Dodge County.

—2,175—

4938 In addition to the acquisition of Theresa Electric Light & Power Company, there was also acquired the electric system of Allenton Electric Company, located in the unincorporated community of Allentown, the town of Addison, Washington County, Wisconsin, Lomira Electric Light & Power Company, was incorporated March 6, 1911, and first rendered service in October of the same year. Its property included an electric system serving in and about the village of Lomira, Dodge County, Wisconsin.

4939

Reeseville Heat, Light & Power Company was incorporated November 12, 1915, first rendering electric service in March, 1916, in and about the village of Reeseville.

Marshall Electric Light & Power Company was incorporated December 23, 1915, and first rendered electric service in the village of Marshall in November, 1916.

Thiensville Electric Light & Power Company was incorporated June 11, 1912, and served in and about the village of Thiensville, Ozaukee County, Wisconsin.

4940

Eden Electric Light Company was incorporated February 20, 1913, and served in the village of Eden, Fond du Lac County, Wisconsin.

Iron Ridge Electric Light & Power Company was incorporated August 23, 1913, and at the time of its acquisition was rendering electric service in the village of Iron Ridge, and in the town of Hubbard, Dodge County, Wisconsin.

—2,176—

On June 23, 1920, Wisconsin Gas & Electric Company acquired by purchase an electric system of the Grafton Light, Heat & Power Company. This company was incorporated October 14, 1910 and furnished electric service in and about the village of Grafton, Wisconsin.

4941

November 22, 1921, Wisconsin Gas & Electric Company acquired a small electric system of the Koshkonong Light & Power Company which served the towns of Koshkonong and Summer both located in Jefferson County, Wisconsin. Koshkonong Light & Power Company was incorporated November 19, 1919.

On September 20, 1922, Wisconsin Gas & Electric Company acquired by purchase the electric distribution system,

4942 Bark River Electric Light & Power Company, located in both the village and town of Sullivan, and in the unincorporated village of Rome, all in Jefferson County, Wisconsin.

On December 23, 1922, Wisconsin Gas & Electric Company acquired a small distribution line operated by Lowell Light & Power Company. This company was incorporated November 1, 1915, and served in both the village and town of Lowell, Dodge County, Wisconsin.

4943 On June 2, 1923, Wisconsin Gas & Electric Company acquired the property of Waukesha Gas & Electric Company. Waukesha Gas & Electric Company was incorporated May 2, 1903, as a successor to both the Waukesha American Gas Company, which was incorporated April 21, 1886, and Waukesha Electric Light Company, which was incorporated June

7, 1886.

At the time of its acquisition by Wisconsin Gas & Electric Company, Waukesha Gas & Electric Company rendered electric and gas service in the city and town of Waukesha, Waukesha County, Wisconsin.

4944 On June 30, 1924, Wisconsin Gas & Electric Company acquired the distribution system of Whitewater Electric Light Company, which was located in the city and town of Whitewater, and the town of Cold Springs, Walworth County. This company was incorporated December 14, 1886, and is believed to have first rendered electric service in 1887.

On April 2, 1926, Wisconsin Gas & Electric Company acquired a small electric distribution system operated by Woodland Light & Power Company, and located in the unincorporated village of Woodland, and in the towns of Hub-

bard, Herman, and Rubicon, all in Dodge County, Wisconsin.

Woodland Light & Power Company was incorporated May 2, 1916, and first rendered electric service in October, 1916.

On July 24, 1926, Wisconsin Gas & Electric Company acquired the Ornamental Street Lighting System in the city of Waukesha, Waukesha County, Wisconsin.

On September 20, 1926, part of the electric system of the Cary Electric Light & Power Company, located in the unincorporated villages of Salem, Wilmot, and Silver Lake, town 4946
of Salem, and in the town of Randall, all in Kenosha County, Wisconsin, was acquired by Wisconsin Gas & Electric Com-

—2,178—

pany. Cary Electric Light & Milling Company was incorporated February 16, 1926, but its electric business is known to have been carried on some time prior to this date.

On December 1, 1926, the Wisconsin Gas & Electric Company acquired the gas and electric utility systems in the city of Fort Atkinson. The gas and electric utility systems acquired were operated by the Fort Atkinson Water, Light & Gas Commission, and served in both the city of Fort Atkin- 4947
son and part of the time Koshkonong, Jefferson County. The electric system is believed to have been acquired by the city of Fort Atkinson in 1901 from the Fort Atkinson Electric Light & Power Company which was incorporated July 22, 1890.

The gas utility was acquired in 1920 from the Fort Atkinson Gas Company which had been incorporated January 23, 1909.

On December 30, 1927, Wisconsin Gas & Electric Company acquired by purchase the electric utility properties of

the Helenville Light & Power Company, and the Lafayette Light & Power Company.

The Helenville Light & Power Company was incorporated June 6, 1918, and served in the Village of Helenville, Jefferson County.

Lafayette Light & Power Company was incorporated November 24, 1920, and operated a small electric utility system serving the town of Lafayette, Walworth County.

—2,179—

4949 On January 3, 1928, having first acquired the capital stock of that company, Wisconsin Gas & Electric Company merged into itself the Badger Public Service Company. Badger Public Service Company was incorporated April 5, 1915, as Elkhart Lake Light & Power Company, which company was successor to Milwaukee and Fox River Valley Railroad Company which was incorporated November 12, 1906.

Badger Public Service Company had acquired, prior to the merger, the electric utility properties of the Cleveland Light & Power Company, which was incorporated February 17, 1913; Oostburg Light, Heat & Power Company, which was
4950 incorporated March 4, 1916; The Malone Light & Power Company, which was incorporated May 27, 1919, and the Kewaskun. Electric Light Company, which was incorporated January 17, 1920.

At the date of its merger with Wisconsin Gas & Electric Company, Badger Public Service Company rendered electric service generally in the counties of Sheboygan, Ozaukee, Fond du Lac, and Washington.

In March, 1928, Wisconsin Gas & Electric Company acquired by purchase a small electric distribution system of

Newville Electric Company. This company was incorporated on January 4, 1926, and was operated as an electric distribution system in the town of Lake Mills, Jefferson County.

On June 6, 1928, Wisconsin Gas & Electric Company acquired the electric distribution system of the Cascade Electric Service Company, serving the village of Cascade

—2,180—

and the town of Lyndon, Sheboygan County.

The Cascade Electric Company was incorporated May 8, 1916. In June, 1929, Wisconsin Gas & Electric Company 4952
acquired the electric distribution system of the Hartford-Rubicon Electric Company, located in the town of Rubicon, Dodge County, and the town of Hartford, and also an electric distribution system in the village of Neosho, Dodge County, Wisconsin.

The Hartford-Rubicon Electric Company was incorporated May 5, 1920.

On January 29, 1932, Wisconsin Gas & Electric Company acquired the electric and heating utility property of Wisconsin Public Utility Company. Wisconsin Public Utility Company was incorporated on July 16, 1925. 4953

Following its incorporation, this company acquired the property of West Bend Heating & Lighting Company, which company was incorporated August 16, 1907. At the time of its acquisition by Wisconsin Gas & Electric Company, Wisconsin Public Utility Company operated a steam heating utility in the city of West Bend, Washington County, Wisconsin, and an electric utility system serving in the city of West Bend, and any number of communities in rural areas in Washington, Sheboygan, Ozaukee and Fond du Lac Counties.

4954 On November 4, 1936, Wisconsin Gas & Electric Company acquired the electric distribution system of Milford Electric Company, located in the town of Milford, Jefferson

—2,181—

County, Wisconsin.

Milford Electric Company was incorporated April 9, 1920, although the electric system operated by it is believed to have been in operation sometime prior to that date.

4955 Q. What is the total of original companies or systems which are today represented by Wisconsin Gas & Electric Company, that is of which it is the successor?

Mr. Binford: Objected to until the question is clarified so as to ask in effect what are the companies, the properties of which have been assimilated or acquired, or in lieu thereof, what are the companies, the corporate structure of which, or the securities of which have been taken over or otherwise acquired by the subject company.

4956 As the question is framed, the answer would necessarily be ambiguous. The question is ambiguous.

Mr. Browning: Mr. Examiner, I am really trying to ask a very simple question. The witness has given a description in some detail of the original companies or systems of which Wisconsin Gas & Electric Company is successor. I was merely asking if he had made a total so that he could give us a figure. The reason that I referred to original companies or systems is that in a number of cases there was an electric property which was not incorporated and I think the witness understands that I am talking about original organizations,

incorporated or unincorporated, which were in the

—2,182—

utility business.

Mr. Binford: The word "successors" is a word of very indefinite meaning. I still insist upon my original objection.

The Examiner: Let's read the question that was objected to.

(Whereupon, the pending question was read by the reporter.) 4958

(Discussion off the record.)

Mr. Browning: Will you please mark this chart entitled "Wisconsin Gas & Electric Company" as Respondents' Exhibit No. 46 for identification?

(The chart referred to was marked for identification as Respondents' Exhibit No. 46.)

By Mr. Browning:

Q. Was this chart, Respondents' Exhibit 46 for identification, made up under your direction, Mr. Van Derzee? A. It was. 4959

Q. And does it correctly set forth the facts shown therein, taken from the books and records of the company? A. It does.

Mr. Browning: I offer this exhibit in evidence as Respondents' Exhibit 46.

Mr. Binford: I would like to ask a question or two before deciding whether I have any objection to this or not.

4960 *Colloquy*

Now, this chart, Mr. Van Derzee, consists of three parallel columns, Wisconsin Gas & Electric Company being the only company set forth in the first column.

—2,183—

A number of other companies' names, together with certain dates, are set forth in the second column, and still a third group of companies, together with dates, being set forth in the third column.

There is no indication on the face of the chart what
4961 this columnar arrangement purports to reflect. Will you please state what it does purport to reflect, if you know?

The Witness: The best way would be to take an example of the West Bend Heating & Lighting Company as shown in what you call the third column, which was incorporated August 16, 1907, and which is connected with a line in the second column described as Wisconsin Public Utility Company, incorporated July 16, 1925.

That company's line ends in a vertical line at the
4962 left of column 2, to which is connected a single line leading toward Wisconsin Gas & Electric Company.

I will now go back to the exact description which I gave you concerning the West Bend Heating & Lighting Company.

Mr. Binford: If I may interrupt for a moment, possibly we can shorten this. Do the companies named in the third column consist of companies, the property of which was in some manner acquired by the respective companies in the second column to which they are connected by lines?

The Witness: Yes.

—2,184—

Mr. Binford: And in turn, do all companies named in the second column represent companies, the properties of which were acquired by Wisconsin Gas & Electric Company?

The Witness: Yes, if you include in your definition of properties, the ultimate acquisition of the property following an intermediate acquisition of the stock.

4964

Mr. Binford: But the intermediate acquisition of the stock is not necessarily to be inferred in each case, is it?

The Witness: No.

Mr. Binford: So that this does not purport to reflect the manner of the acquisition of the actual physical properties in any particular case?

The Witness: That is correct. That is covered by my description of each corporation.

Mr. Binford: No objection.

The Examiner: The chart is admitted in evidence as Respondents' Exhibit 46.

4965

(The chart referred to was received in evidence as Respondents' Exhibit No. 46.)

By Mr. Browning:

Q. Now, Mr. Van Derzee, will you tell us whether you counted the properties which are represented in this chart, and which were so acquired by Wisconsin Gas & Electric Company? A. Yes.

4966 *Gould W. Van Derzee—By Respondents—Direct*

Q. Will you give us the total? A. The physical prop-

—2,185—

erties now in the system of Wisconsin Gas & Electric Company, were at one time, except to the extent that possibly some of the property has been retired, owned by sixty different companies, individuals or municipalities.

Q. What was the effect of these acquisitions?

Mr. Binford: Objected to as too general, calling for the opinion of the witness on other than the technical subject upon which he has been qualified.

4967

Mr. Browning: I submit, if the Examiner please, that the witness' qualifications entitled him to answer the question.

Mr. Binford: As far as the record shows and as far as the question goes, it might relate to what is the effect upon public welfare, what is the effect upon politics, what is the effect upon the ultimate concentration of stock ownership or any other subject. What kind of effect is what should be specified.

4968

Mr. Browning: I can make the question more specific and inquire what was the effect upon service and rates.

The Witness: My opinion as to the effect of the acquisition of these properties on the service and rates of the several companies and systems is that the rates were materially reduced and that the service was improved.

Mr. Schmidtman has previously testified in detail with respect to the rates. I know from my own personal experience that it was necessary for us to re-

build parts of the systems of some of these small com-

—2,186—

panies to replace the poles, put up larger wires, and I say the service was also improved.

Mr. Browning: Will you please mark for identification, as Respondents' Exhibit No. 47, this chart which consists of four sheets, the first sheet being entitled "Wisconsin Gas & Electric Company, Securities Outstanding by Classes at December 31, 1902-1939, inclusive, and as at June 30, 1940." 4970

(The chart referred to was marked for identification as Respondents' Exhibit No. 47.)

By Mr. Browning:

Q. Mr. Van Derzee, was this chart, which is Respondents' Exhibit 47 for identification, prepared under your direction and taken from the books and records of the company? A. It was.

Q. And the facts therein stated are correctly set forth? A. Yes. 4971

Mr. Browning: I offer this chart in evidence as Respondents' Exhibit 47.

Mr. Binford: No objection.

The Examiner: The chart of four sheets is so admitted.

(The chart referred to was received in evidence as Respondents' Exhibit No. 47.)

4972 *Gould W. Van Derzee—By Respondents—Direct*

By Mr. Browning:

Q. This chart sets forth a summary of the financial history of Wisconsin Gas & Electric Company? A. Insofar as

—2,187—

it goes, yes.

Q. I think the material on the chart speaks for itself, but will you point out any matters which you think should be pointed out? A. I will refer to the four pages of this exhibit, No. 47, as 1, 2, 3 and 4. Page 1 is a statement of securities
4973 outstanding by classes as at December 31, 1902, up to 1939, inclusive, and as at June 30, 1940. It is interesting to note that as of December 31, 1902, the total outstanding securities were of two issues, aggregating $1,200,009.00 par value. At December 31, 1939, they had increased to $21,611,500.00.

During that period, the number of issues increased to a maximum of ten about the year 1924, and the number of issues has dropped until at the present time there are five outstanding, indicating a substantial simplification of our financial structure in that period.

On sheet number 2 is shown a record of the mortgage
4974 bonds outstanding within the same period indicated on number 1. Here are listed the names, interest rate and due dates, of the several mortgages including underlying mortgages on the property of the company.

In 1902, the total outstanding amount of securities was $700,000.00. In 1939, the amount had increased to $10,769,000. The highest coupon rate required at any time in order to get money, was 6 per cent.

—2,188—

There are also some 5 per cent. issues and there is still outstanding a non-callable issue of Waukesha Gas & Electric

Company underlying 5 per cent. bonds, but the important observation that one can make by glancing at this sheet is that the company was last able to finance its requirements by the sale of bonds at a rate of 3½ per cent., a material reduction from the high of 6 per cent.

Turning to page 3, we find a record of notes outstanding within the same period previously described. The first notes were issued in 1918 in the amount of $300,000.00 and they were 6½ per cent. of five-year secured gold notes.

At the present time, there are outstanding $1,200,000.00 4976
of 2¾ per cent. unsecured promissory notes of the company, due serially to 1946.

In between the first note issue and the last note issue the need for money required financing at a time when the credit of the company could do no better than to sell 7 per cent. notes on a ten-year basis.

On page 4 is a statement of the capital stock of the company by years for the same period previously discussed. In 1902 the capital stock at the end of the year was $500,000.00. At the present time it is $9,342,500.00.

The highest rate of dividends in any preferred stock issue 4977
of the company was 7 per cent. There were two issues of that type. On was non-cumulative participating and the other was cumulative non-participating.

—2,189—

This participating reference, I recollect, is to the opportunity that an owner of the 7 per cent. stock had to participate in the earnings on the common stock after a certain dividend had been paid on the common stock.

Outstanding at the present time is the relatively new series of 4½ per cent. cumulative and non-participating stock.

Q. Will you describe for us the corporate history of Wisconsin Michigan Power Company? A. Wisconsin Michigan Power Company, as presently constituted, results from the consolidation in the year 1927 of a group of companies furnishing electric, gas and electric railway, utility services in about the city of Appleton, Neenah, and the city of Iron Mountain and the neighboring communities in upper Michigan.

Subsequent to the consolidation in 1927, a number of
4979 minor acquisitions of electric property occurred. On May 17, 1927, pursuant to an application previously filed, the Railroad Commission of Wisconsin, predecessor to the present Public Service Commission of Wisconsin, issued an order approving the consolidation by merger of the following Wisconsin companies with Peninsular Power Company.

The latter company's name was changed to Wisconsin Michigan Power Company in May, 1927, and these companies mentioned were Star Electric Light & Power Company, Badger Utility Company, The Weyauwega Electric Light

—2,190—

4980 Company, Aurora Electric Light & Power Company, Niagara Light & Power Company, Wisconsin Light, Heat & Traction Company.

In addition to the merging of the above companies, approval was given for the purchase of the 132,000 volt Appleton substation and the Pemene Dam site, and for the purchase of all the assets subject to the liabilities of the Utility Realty Company, a Wisconsin company, and of each of the following companies operating in the State of Michigan.

Alpha Lighting Company, Iron Mountain Electric Light, Heat & Power Company, Amasa Lighting Company, Powers-

Spalding Light Company, Dickinson County Public Service Company, Loretto Light & Power Company.

Peninsular Power Company was incorporated in the State of Wisconsin on May 9, 1911. This company originally furnished electric service in and about the city of Iron Mountain, which is in Michigan, and certain iron mines in the vicinity of Iron River, Michigan.

This is a very important iron center in the upper Peninsula.

On October 20, 1926, Peninsular Power Company acquired by purchase certain of the electric utility properties of Wisconsin Northern Light, Power & Heat Company, Incorporated, located about the unincorporated village of Tustin, Winnebago County, Michigan. 4982

On May 17, 1927, the corporate name of Peninsular Power Company was changed to Wisconsin Michigan Power

Company.

Star Electric Light & Power Company, which is one of the companies previously named, was incorporated in Wisconsin on January 15, 1923. The company rendered electric service in and about the vicinity of the city of New London, Outagamie County. 4983

On May 26, 1927, it was merged into Wisconsin Michigan Power Company.

Badger Utility Company was incorporated on September 11, 1920, as the successor to the Pulaski Woodenware Light & Power Company. The latter company was incorporated in Wisconsin as Pulaski Light & Power Company on September 22, 1915, and rendered electric service generally in

and about the village of Pulaski, Brown County, Wisconsin.

On August 1, 1924, Badger Utility Company acquired from Northeastern Power Company certain electric utility property which had formerly been all or part of the property of the Gillett Public Service Company which operated in and about the village of Gillett, Oconto County, Wisconsin.

Gillett Public Service Company was incorporated in Wisconsin on March 6, 1917.

On May 26, 1927, the Badger Utility Company was merged
4985 into Wisconsin Michigan Power Company.

The Weyauwega Electric Light Company was incorporated in Wisconsin June 10, 1903.

—2,192—

Q. Isn't that July? A. Correction. That is July. It operated a hydro-electric generating and electric distribution utility serving in the village of Weyauwega, Waupaca County, Wisconsin.

On May 26, 1927, this company was merged into Wisconsin Michigan Power Company.

Aurora Electric Light & Power Company was incorpo-
4986 rated in Wisconsin September 22, 1922. It operated an electric distribution system serving in Aurora Township, Florence County, Wisconsin. On May 26, 1927, this company was merged into Wisconsin Michigan Power Company.

Niagara Light & Power Company was incorporated in Wisconsin August 8, 1918. This company served in and about the village of Niagara, in Marinette County, Wisconsin, and also in Dickinson County, Michigan.

On May 26, 1927, the company was merged into Wisconsin Michigan Power Company.

4987

Alpha Lighting Company was incorporated in Michigan in 1915. It rendered electric utility service in and about the village of Alpha, Iron County, Michigan. On June 4, 1927, the property of this company was acquired through purchase by Wisconsin Michigan Power Company.

Iron Mountain Electric Light & Power Company was incorporated in Michigan, April 16, 1891. At the date of acquisition of this property, on June 4, 1927, by Wisconsin Michigan Power Company, the property of the company con-

—2,193—

4988

sisted of an electric distribution system serving in and about the city of Iron Mountain, Michigan.

The Amasa Lighting Company was incorporated in Michigan on January 10, 1922. This company operated an electric distribution system in and about the village of Amasa, Iron County, Michigan. On June 4, 1927, this property was acquired through purchase by Wisconsin Michigan Power Company.

The Examiner: Let us take a recess.

(Whereupon a short recess was taken.)

4989

A. (Continued) Powers-Spalding Light Company was incorporated in Michigan on April 17, 1926, as successor to Power-Spalding Light & Power Company which was incorporated June 3, 1921. The company operated an electric distribution system in and about the village of Powers, Menominee County, Michigan. On June 4, 1927, this property was acquired through purchase by Wisconsin Michigan Power Company.

4990

Dickinson County Public Service Company was incorporated in Michigan on May 29, 1925, and rendered electric service generally in Dickinson County, Michigan. On June 4, 1927, this property was acquired through purchase by Wisconsin Michigan Power Company.

Loretto Light & Power Company was incorporated in Michigan on March 22, 1919. This company served in and about the village of Loretto, Dickinson County, Michigan, and was acquired through purchase by Wisconsin Michigan

4991

—2,194—

Power Company on June 4, 1937.

Wisconsin Traction, Light, Heat & Power Company was incorporated in Wisconsin, March 24, 1900. Upon or shortly after its incorporation, this company succeeded to the business of the Fox River Valley Electric Railway Company and the Appleton Electric Light & Power Company.

In September, 1904, Wisconsin Traction, Light, Heat & Power Company acquired the property of Fox River Valley Gas & Electric Company.

4992

In November, 1920, Wisconsin Traction, Light, Heat & Power Company also acquired the property of Seymour Electric Company, operating in and about the village of Seymour, Outagamie County, Wisconsin.

Of the above acquisitions and successions of the Wisconsin Light, Heat & Power Company, the Appleton Electric Power Company, which was incorporated in Wisconsin January 29, 1896, had in turn succeeded the Appleton-Edison Electric Company, incorporated July 28, 1891.

The latter company had succeeded the Appleton-Edison Light Company, Limited, which was incorporated on May

24, 1883, and Appleton Electric Street Railway Company, incorporated January 19, 1886.

The Appleton Electric Power Company had also acquired the Citizens Electric Power Company of Wisconsin, which had been incorporated in Wisconsin July 26, 1894.

Fox River Valley Electric Railway Company was incorporated in Wisconsin July 22, 1897, and was successor to

—2,195—

Neenah and Menasha Electric Railway Company, incorporated in Wisconsin May 10, 1892. 4994

Fox River Valley Gas & Electric Company was incorporated in Wisconsin March 31, 1901. This company had succeeded Appleton Gas, Light & Fuel Company, incorporated in Wisconsin October 27, 1894, and Neenah-Menasha Gas & Electric Company which had been incorporated in Wisconsin April 17, 1879, as Neenah & Menasha Gas Company.

Up to April, 1923, The North American Company had acquired 95 per cent. of the common stock of Wisconsin Traction, Light, Heat & Power Company issued and outstanding. 4995

At the time of the merging into Wisconsin Michigan Power Company, Wisconsin Traction, Light, Heat & Power Company operated, in addition to transportation and gas utilities, an electric hydro and steam generating plant located in the city of Appleton, Outagamie County, and an electric transmission and distribution system serving in and about the city of Appleton and the cities of Neenah and Menasha, Winnebago County, Wisconsin. On November 1, 1927, Wisconsin Michigan Power Company acquired by purchase the distribution system of Nadeau Brothers Elec-

4996 tric Utility serving in the unincorporated village of Nadeau, Menominee County, Wisconsin.

On November 30, 1927, Wisconsin Michigan Power Company acquired by purchase the electric distribution system of Wisconsin Land & Lumber Company serving in the Town-

—2,196—

ship of Myer, Menominee County, Michigan.

On February 29, 1928, Wisconsin Michigan Power Company acquired by purchase, certain electric distribution
4997 property of the Lake States Public Service Company, serving generally the counties of Baraga, Houghton, Ontonagon, Alger and Marquette in upper Michigan.

On March 9, 1928, the Wisconsin Michigan Power Company acquired by purchase the electric distribution system of Brunswick Lumber Company, serving in the town of McMillan, Ontonagon County, Michigan.

On May 11, 1928, Wisconsin Michigan Power Company acquired by purchase the electric utility system of Delta Public Service Company serving the towns of Escanaba, Baldwin, and Brampton, in Delta County, Michigan.

4998 On May 18, 1928, Wisconsin Michigan Power Company acquired by purchase of the electric utility system of the Township of Watersmeet, serving the unincorporated community of Watersmeet, Gogebic County.

In August, 1928, Wisconsin Michigan Power Company acquired by purchase the electric distribution system of Mapleridge Manufacturing Company, serving the unincorporated village of Rock, Delta County, Michigan.

On October 15, 1928, Wisconsin Michigan Power Company acquired by purchase the electric distribution system

of Northern Sawmill Company, serving the town of Sagola,

—2,197—

Dickinson County, Michigan.

On November 22, 1928, Wisconsin Michigan Power Company, pursuant to authority granted by the Railroad Commission of Wisconsin, acquired by purchase from Wisconsin Gas & Electric Company certain transmission property, including a circuit and one-half interest in towers from Appleton City Limits to a point west of Forest Junction, Wisconsin, both circuit and steel transmission towers from 5000
Forest Junction to Green Bay, Wisconsin, the circuit extending from Green Bay to Amberg, Wisconsin, the circuit from Amberg to Chalk Hills and both towers and circuit from Amberg to Twin Falls hydro-electric plant, near Iron Mountain, Michigan.

On June 5, 1929, Wisconsin Michigan Power Company acquired by purchase the electric distribution system of the Weideman Lumber Company serving in the town of Interior, Ontonagon County, Michigan.

On June 7, 1929, Wisconsin Michigan Power Company acquired by purchase the electric distribution system owned 5001
by Robert P. Kunze, located in the unincorporated village of Sidnaw, Houghton County, Michigan.

On June 22, 1929, Wisconsin Michigan Power Company acquired by purchase the electric distribution system of the Steuben Outdoor Club located in the Township of Winchester.

On August 2, 1929, Wisconsin Michigan Power Company acquired by purchase the electric distribution system of

—2,198—

Trout Creek Manufacturing Company, serving the unincorporated village of Trout Creek, Ontonagon County, Michigan.

On March 31, 1933, Wisconsin Michigan Power Company acquired by purchase the transmission power line of the Oliver Iron Mining Company located in the town of Breitung and in Norway City, Dickinson County, Michigan.

On July 5, 1934, Wisconsin Michigan Power Company acquired by purchase the Quinnesec Falls hydro-electric plant and the transmission system owned jointly by Oliver
5003 Iron Mining Company and the Chapin Iron Mining Company located in Breitung and the city of Iron Mountain, Dickinson County, Michigan, and the towns of Aurora and Niagara in Florence County, Wisconsin.

Mr. Browning: Will you please mark for identification this chart which is entitled "Wisconsin Michigan Power Company"?

(The chart referred to was marked for identification as Respondents' Exhibit No. 48.)

5004 *By Mr. Browning*:

Q. Mr. Van Derzee, was this chart, Respondents' Exhibit 48, prepared under your direction, and was the information shown thereon taken from the books and records of the company? A. It was prepared under my direction and the information taken from the books of the company and generally it has been prepared in the same manner and shows the same general information, except that there is a fourth column, as described in connection with Exhibit No. 46 in connection

with the Wisconsin Gas & Electric Company.

5005

Mr. Browning: I offer the chart in evidence as Respondents' Exhibit No. 48.

Mr. Binford: I would like to ask one or two questions with respect to this.

Are all these transactions presently reflected upon the books of Wisconsin Michigan Power Company, that is to say, all of the transactions purported to be reflected upon Respondents' Exhibit 48 for identification?

5006

I believe you stated that these matters were all taken from the books and records of that company.

The Witness: Yes.

Mr. Binford: They are all reflected in it?

The Witness: They are.

Mr. Binford: No objection.

The Examiner: This chart is received as Respondents' Exhibit 48.

(The chart referred to was received in evidence as Respondents' Exhibit No. 48.)

5007

By Mr. Browning:

Q. Can you state what is the full number of properties so acquired and which have gone to make up Wisconsin Michigan Power Company? A. Forty-two is the number of properties which have so entered into the Wisconsin Michigan

2,200—

Power Company.

5008 *Gould W. Van Derzee—By Respondents—Direct*

Q. What was the effect of the acquisitions upon the rates and service theretofore given to the customers? A. Rates were lowered and service generally was bettered.

Mr. Browning: Will you please mark for identification this chart entitled "Wisconsin Michigan Power Company, Securities Outstanding by Classes as at December 31, 1911-1939, inclusive, and as at June 30, 1940"? That will be Respondents' Exhibit 49 for identification.

5009

(The chart referred to was marked for identification as Respondents' Exhibit No. 49.)

By Mr. Browning:

Q. Was this chart prepared from the books and records of the company and does it correctly set forth the facts therein stated? A. Yes.

Mr. Browning: I offer it in evidence as Respondents' Exhibit No. 49.

Mr. Binford: I would like to ask one question with respect to this proffered exhibit.

5010

On page 2 of the present exhibit and on page 4, thereof, which purport to reflect, respectively, mortgage bonds outstanding and notes outstanding, the interest rate stated is, I presume, the coupon rate in the case of bonds, or the stated rate of interest in the case of notes, is that correct?

—2,201—

The Witness: Yes.

Mr. Binford: The figures at the tops of the respective columns on the pages indicated do not purport

to reflect the actual interest paid by the company, in that they do not show the discount or premium at which the notes or mortgage bonds were sold, that is true, is it not?

The Witness: That is right. There is no inference that the bonds were all sold at par by the mere statement of the coupon rate.

Mr. Binford: The observation is likewise true, in respect of Exhibit 47, is it not, as to the Wisconsin Gas & Electric Company? 5012

The Witness: Yes.

Mr. Binford: No objection.

The Examiner: This last mentioned chart or tabulation is admitted in evidence as Respondents' Exhibit 49.

(The document referred to was received in evidence as Respondents' Exhibit No. 49.)

By Mr. Browning:

Q. Do you have any comments with respect to this chart? A. Page number 1 of Exhibit No. 49 shows the securities outstanding by classes as at December 31, for the period 1911 to 1939, inclusive, and as at June 30, 1940. The table begins with 1911 at which time the par value of the outstanding securities, of which there was one issue, was $750,000.00. 5013

As time went on, the number of issues increased to a maximum of six in the year 1929, and has dropped to four at the present time, that is as of June 30, 1940, but the total par amount has increased to $22,545,000.00.

Going to the detail, and specifically page 2, which refers to mortgage bonds outstanding within the period previously mentioned, a total amount of bonds outstanding in 1912 was $375,000 and as of June 30, 1940, $12,500,000.00.

In that period the highest coupon rate of any of the company's bonds or the underlying issues, was 7½ per cent. Those bonds were outstanding from the period of 1927 to 1930, inclusive.

There were also issues at a 5 per cent. rate and at the
5015 present time the entire issue of $12,500,000 of bonds bears a coupon rate of 3¾ per cent.

As in the case of the other companies, this indicates improving credit and that the company is getting its financial house better in order.

Sheet number 3 shows the capital stock outstanding within the periods mentioned. In 1911 the total capital stock outstanding was $750,000.00. As of June 30, 1940, the amount had increased to $9,425,000.00.

During that long period of years, it was necessary to sell preferred stock having an 8 per cent. dividend rate. This
5016 condition prevailed from 1912 to 1917 in one of the predecessor companies.

—2,203—

There was also a long period from 1917 to 1926 when 7 per cent. preferred stock was outstanding, and from 1926 to 1938 a 6 per cent. series was outstanding.

At the present time, however, and for the last year and a half, there has been outstanding an issue of 4½ per cent. preferred stock, which indicates that the preferred stock rate has dropped to nearly one-half what it was at the peak.

The common stock of $5,425,000.00 now outstanding is all owned by The North American Company.

Page number 4 is a statement of the notes outstanding within the period previously indicated, except that no notes were issued earlier than 1921, at which time $300,000.00 gross amount was outstanding.

That amount has increased to the present time, that is June 30, 1940, to $620,000,000. At one time these notes were serial gold notes bearing an 8 per cent. rate. Those were of the old Peninsular Power Company. 5018

At the present time, the outstanding unsecured promissory note of the company, due serially 1940, bears a rate of 2½ per cent., indicating the improvement that has been made in source of financing by the company.

Q. Can you tell us what provision is made for depreciation by the three electric companies in the Wisconsin-Michigan group? A. In 1939, Wisconsin Electric Power

Company set up depreciation equal to 12.05 per cent. of the operating revenue. That amount was 2.31 per cent. of its property. 5019

Wisconsin Gas & Electric Company, in the same year, set up 12.24 per cent. of revenue and 2.74 per cent. of property.

Wisconsin Michigan Power Company set up 12.76 per cent. of revenue, and 1.77 per cent. of physical property.

The average of 188 public utilities included in the 1939 report of the Securities and Exchange Commission showed 10.88 per cent. of operating revenue and 1.9 per cent. of property. For the three companies, the depreciation reserve in per cent. of property, for Wisconsin Electric Power Com-

pany, was 28.65, for the Wisconsin Gas & Electric Company was 25.81 for Wisconsin Michigan Power Company, 14.03 per cent.; and for the average of the said 188 public utilities, 10.85.

The purpose of this table is to show that the amount of annual reservation by these three companies is substantial by comparison with what the industry is doing generally, and that the depreciation reserve in per cent. of property for the three companies is also well above the average for the
5021 188 companies.

The lowest reserve of the three companies is 14.03 per cent., which is the Wisconsin Michigan Power Company, and that is largely due to the fact that it has so much water power, and also to the fact that it is a relatively late acquisition by the company and its depreciation policies have not been in effect for as many years as in the case of the other

companies.

In giving these figures, I don't mean to state that we actually set up depreciation at exactly these percentages of
5022 operating revenue. These are the equivalent of the annuity and interest on reserve balances that follow the use of the sinking fund method of depreciation which is in effect for all three companies.

Mr. Browning: Mr. Examiner, in that connection, I should like to refer you to the dissenting opinion of Justice Brandeis in United Railways & Electric Company versus West, 280 U. S. 234, in which he said——

Mr. Binford: I object to the quotation. I believe a citation is sufficient for the purpose of this record at this time.

5023

Mr. Browning: The statement in question was The Milwaukee Electric Railway & Light Company was a pioneer in the United States in setting up depreciation, and I thought it would be helpful to the Examiner to have that reference, but what I was going to read was just two sentences and it makes no difference.

Mr. Binford: I will withdraw the objection without in any way conceding.

Mr. Browning: The statement was: "The business device known as a depreciation charge appears not to have been widely adopted in America until after the beginning of this century.

5024

—2,206—

Among street railways, The Milwaukee Electric Railway & Light Company became a pioneer by adopting it in 1897."

(Discussion off the record.)

By Mr. Browning:

5025

Q. Have investors in the securities of the companies in the Wisconsin-Michigan group been unable to obtain the information necessary to appraise the financial position or earning power of the issuing company because of the absence of uniform standard accounts? A. No. The company is using the Uniform System of Accounts prescribed by Public Service Commission of Wisconsin and designed to be in conformity with the requirements of the Uniform System of Accounts prescribed by the Michigan Public Utilities Commission for electric utilities.

5026 *Gould W. Van Derzee—By Respondents—Direct*

The present Uniform System of Accounts was made effective January 1, 1938, and it has superseded the classification which has been in effect for a great many years issued by the former Railroad Commission of Wisconsin.

Q. Your answer was designed to apply to all three companies, I take it? That is, to Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company, except that the Michigan Commission's rules only apply to the last-named company? A.
5027 That is right.

Q. Do the public utilities in Wisconsin publish any financial information? A. Yes, with respect to the information relative to the financial position of the companies, the public utilities of Wisconsin are obliged to publish by March 15 of each year, a complete statement of the assets and liabilities as appearing in their reports to the Public Service Commission in detail. It must be placed in a newspaper of general circulation so that anyone interested can get the information.

Q. Have any of these companies issued securities without
5028 the approval or consent of the states having jurisdiction over them? A. No. The issuance of all securities by public utilities in the states of Wisconsin and Michigan can be made only upon the consent and approval of the regulatory bodies of those states.

Q. Have the three companies issued securities upon the basis of fictitious or unsound asset values having no fair relation to the sums invested in them or the earning capacity of the properties?

Mr. Binford: Objected to upon the ground that the question as framed, being in the words of the statute

referred to, calls for a conclusion of law from the witness.

Mr. Browning: I don't agree that that is a conclusion of law.

Mr. Binford: The interpretation of those words as used in the Statute and as quoted apparently by Mr.

—2,208—

Browning, are words of law.

In effect, the witness is being asked whether or not certain recitals in the Public Utility Holding Company Act of 1935 are or have been applicable to his company. I believe that is a question of law. 5030

The Examiner: Read the question to me now again.

Mr. Binford: If it is not a question of law, it is certainly a question of ultimate rather than evidenitary fact.

(Whereupon, the pending question was read by the reporter.)

The Examiner: I overrule that objection.

Mr. Binford: Exception. 5031

Mr. Browning: Do you want to read the question to the witness?

(Whereupon, the pending question was reread by the reporter.)

The Witness: The state regulatory commission, prior to granting their consent for the issuance of any kind of securities, either in the state of Wisconsin or Michigan, conduct a very thorough and careful examination of the companies' financial condition and

5032 *Gould W. Van Derzee—By Respondents—Direct*

operations and say, themselves, that the proposed issue of securities are supported by sound asset values and bear a fair relation to the sums invested.

—2,209—

By Mr. Browning:

Q. Do the three companies issue securities upon the basis of paper profits from inter-company transactions, or in anticipation of excessive revenues? A. No. The Public
5033 Service Commission of Wisconsin, under its general order known as 2-U-2, issued June 11, 1931, requires that all contracts or agreements, whether oral or written, shall be approved by the Commission if they are entered into with affiliate interests. They have to be filed with the Commission and they are very carefully investigated.

I have something to do with that matter, myself, and very seldom is an affiliate agreement of any kind sent to the Commissions for approval that does not have a good many questions asked about it so that their files relate the entire
5034 circumstances surrounding the case. Sometimes there are hearings.

Q. Well, do you have paper profits between your companies? A. We have no paper profits.

Q. Has any of the three companies issued securities under circumstances which subjected it to the burden of supporting an over-capitalized structure tending to prevent voluntary rate reductions?

Mr. Binford: Objected to as calling for an opinion of the witness.

5035

The Examiner: Well, what have you to say to that, Mr. Browning?

—2,210—

Mr. Browning: I think the witness is well qualified to answer the question. The charge that is made against us is that this practice is intended to prevent voluntary rate reductions. The charge is entirely unjustified. It is not a fact. I think we should be entitled to put that in.

5036

Mr. Binford: I beg to differ as to any such charge of such character being made in this proceeding. Mr. Browning endeavors to construe the introductory portion of the Public Utility Holding Company Act of 1935 reciting abuses which led to the enactment of that Act as expressed by Congress as an indictment of his particular clients in this particular proceeding which he is called upon to answer. I fail to see that that is an issue before us at this time.

Moreover, I still assert and insist upon my objection to the effect that the question calls for the opinion of the witness. There are certain matters requiring expert knowledge as to which opinion evidence may be given as such, but as to conclusions of ultimate fact those things are for the tribunal which ultimately must judge the case and they are not to be answered by a particular witness upon the stand.

5037

Mr. Browning: I submit that this witness, by his training and qualifications, is so well qualified to express opinions on these questions that the tribunal which is ultimately to decide those questions ought to wish to have his opinion.

5038 *Gould W. Van Derzee—By Respondents—Direct*

The Examiner: I will permit the witness to answer the question and you may have an exception, Mr. —2,211—

Binford.

Mr. Binford: Thank you, sir. I will take the exception.

The Witness: Well, it is true that all public utilities operating in the state of Wisconsin and in the state of Michigan can issue securities only upon the

5039 consent and approval of the regulatory commissions of those states.

The point that Mr. Browning made that related to whether or not rate reductions were being held off because of securities being issued that should not be issued, I would like to state my intimate knowledge of the methods of regulation in Wisconsin and Michigan, which determine rates entirely independent of securities and based only on the fair value of the property.

I have had too intimate dealings in the last 28

5040 years with proving property and having the figures used in the determination of rates, without any reference whatever to securities to believe that any rate reductions are interfered with by improper issuance of securities.

By Mr. Browning:

Q. That is, the two things simply aren't connected. Rates are based on a rate base. A. Yes.

Q. Which is independent of securities issued. A. In the case of Wisconsin Electric Power Company, for example,

the old Railroad Commission of Wisconsin made an inventory and appraisal of January 1, 1914. I personally worked very close to that, supplying information that the Commis-

—2,212—

sion wanted at that time. The inventory of physical property, when finally completed, was appraised by the Commission and certain value set, and it is on the basis of that January 1, 1914 appraisal which happens to give a value less than the actual book figures that net property additions are added from that time to this to determine the rate 5042
base. It has no relation to securities whatsoever.

Q. Are your three electric companies subjected to excessive charges for services, construction work, equipment and materials by The North American Company? A. No, no payment is made to The North American Company for services, construction work or equipment.

Q. Have they entered into transactions in which evils have resulted from an absence of arm's length bargaining or from restraints of free and independent competition?

Mr. Binford: Mr. Examiner, I haven't objected to 5043
the last two questions but I wish to object most strenuously to that; it requires the opinion of the witness as to what is evil and it is certainly a thing upon which I have never heard of expert opinion testimony being offered.

The Examiner: I will sustain that objection.

Mr. Browning: Mr. Examiner, I find myself at a disadvantage because I should be the first to concede the nonsense that was placed in this statute. The witness has just pointed out the nonsense in the preced-

5044 *Gould W. Van Derzee—By Respondents—Direct*

ing question. I find myself at a disadvantage, there-
—2,213—
fore, in dealing with it.

By Mr. Browning:

Q. Has control of your electric companies by The North American Company affected the accounting practices and rate and dividend policies of such companies so as to complicate and obstruct state regulation of such companies? A.
5045 No.

Mr. Binford: I had no opportunity to object to that question before it was answered. Therefore, I now move to strike both question and answer, insofar as the question relates to the effect of The North American Company's influence upon state regulation, in that that, again, calls for the opinion of the witness.

There was a witness before this who might possibly have been qualified to express an opinion upon that subject but I do not believe that this witness has
5046 been a member of any regulatory body insofar as the record shows, which would qualify him to answer the question as an expert, nor is he now asked to state any facts which might lead to a conclusion by the Commission or the Courts as to the truth or falsity of the statement. He is merely asked for his own personal feeling in the matter, in effect, and at best his opinion.

Mr. Browning: Mr. Examiner, this witness has had a very intimate contact with state regulation. He has had a contact which has extended over a period of some 27 years. He has an acquaintanceship and

a knowledge of that subject which cannot possibly be

—2,214—

duplicated here.

(Discussion off the record.)

The Examiner: I think that the experience and activities of this witness before and with the regulatory bodies of Wisconsin and Michigan should be more clearly established in this record as a predicate for this question. 5048

By Mr. Browning:

Q. Have you had any contact with the Public Service Commissions of Wisconsin and Michigan? A. I have had quite extensive contact with the Public Service Commission of Wisconsin and a lesser contact with the Public Service Commission of Michigan. My contact with the Public Service Commission of Wisconsin goes back to 1914 and at that time, as I stated a few moments ago, I was very intimately connected with the valuation work of our property which was under the direction of the Public Service Commission of Wisconsin. I was the individual in the company then rated as 5049 assistant to the vice president who had charge of all of the contacts with the Commission engineers from the time the inventory was started until the appraisal was completed.

That experience involved a rather basic grounding in the making of appraisals of public utility property, in fact the valuation of January 1, 1914 of The Milwaukee Electric Railway Company has been referred to in subsequent years as one comprising great detail and the particularly good chapter on various overheads of construction that went with it.

—2,215—

5050 My personal duties at that time, in addition to taking care of the company's end of seeing that all the property was counted, included many discussions with the engineers of the Commission as to the proper price to be placed. The Commission did not just arbitrarily state, "We are going to use this figure". The Commission engineers asked us to produce evidence that prices of underground conduit poles and machinery as proposed by us were correct.

We had long and detailed discussions on what is the
5051 proper amount for interest during construction, what is a proper amount for omissions of inventory, what should be allowed for insurance, injuries and damages, and in fact in the three years that were involved in the making of the inventory before the inventory was finally priced, I think I went through every classification of inventory and appraisal work as applied to a rather large property.

After that time I had charge of rate contacts, all of them, for The Milwaukee Electric Railway and Light Company, Wisconsin Gas and Electric Company, and Wisconsin Michigan Power Company. I appeared at the request of the
5052 staff to discuss rates informally. I have appeared before the Commission to discuss rate problems of the company informally and I have appeared in many formal casses before the Commission and discussed the philosophy of rate-making in all its various aspects.

—2,216—

I have appeared before the Commission as a representative chosen recently by the utilities of the state to open up the discussion on various new rules and regulations which the Commission propounded and which the companies of the

state objected to because of the fact that it appeared to the companies that the Commission was endeavoring to enter the field of management through the route of regulation.

I have, in the field of accounting, appeared before the Commission on many different subjects and over a long period of years and on the Classification of Accounts with particular emphasis on important topics such as depreciation. I have put in testimony from time to time in connection with rate discussions on cost of money, rate of return, financial requirements viewed in relation to what you need to service 5054
your debt and cover your preferred stock dividends and your common stock, and for surplus.

I haven't had occasion ever to tell anybody on short notice just what are all the things that I have done in the field of regulation.

(Discussion off the record.)

The Examiner: Let's go back on the record now and let the witness finish his answer, unless you want to ask a question.

5055

The Witness: In connection with the appearance before both the Commission and the staff in the matter of rates, I have personally developed, for example, the "Ten for One" plan which was described by Mr.

—2,217—

Schmidtmann. I developed it and I named it. I had to sell it to the staff and to the Public Service Commission of Wisconsin so I have been active in the field of rates which is one of the end-products of the Public Service Commission deliberations.

5056 *Colloquy*

With respect to the Public Service Commission of Michigan, my earliest contacts with that body were about the time that our interests acquired Peninsular Power Company. I participated in a rate case before that body probably as far back as 1925.

One of the things that I remember about that particular case which looks strange in the light of present day conceptions was that they thought perhaps the depreciation was a little bit low and agreed that after
5057 earning eight per cent. on the investment we would have to put the balance in depreciation reserve until a certain figure was reached.

Those conditions, of course, are far away and long ago.

Shortly after the instance I just cited, and after we had completed a valuation which I had charge of for all of the various properties that went into the consolidation of Wisconsin Michigan Power Company, I appeared before the Michigan Commission and explained and had approved the valuation of the physical
5058 property of that company. One of the instances of that particular appearance, which was about 1927, as I recollect, was the look of amazement on the faces of the Commissioners when I volunteered that the company was not interested in reproduction cost for the making of rates or had never been up to that time,

and as far as I could see did not expect to be in the use of cost of reproduction.

I have had various contacts from time to time since then with the Michigan Commission, but infrequently.

The personnel set-up, methods of operation, are quite like the Wisconsin Commission although they haven't been as intimately into the details of things for as long a period of time.

I personally sign all of the rate sheets that go to the Michigan Commission and the Wisconsin Commission for all the companies in our group. I mention that merely to indicate that I still keep in active touch with matters of rates, methods of formulating them, and that I have a date for a personal appear- 5060
ance before the Public Service Commission of Wisconsin about the middle of October which will involve a long discussion on the question of the ability of the company at this time to make further reductions in rates and the relation of that problem to the future.

By Mr. Browning:

Q. As one of the general executive officers of the three companies, have you been in general charge of all matters in connection with the Commissions for some time? A. While there has been no line diagram stating that I am in 5961
general charge, I keep in contact with all important matters that are coming before the Commission and participate actively in the formulation of the character of information that is to be given before them where any important rate

cases are involved. I don't go out there on every little discussion of claims and minor changes in rates. I have an assistant, Mr. E. J. Steinberg, who is called an executive assistant, who devotes practically all of his time to the minor operations and rate problems of the three companies.

5062 *Gould W. Van Derzee—By Respondents—Direct*

Q. You are in intimate contact with the policies of the companies in dealing with the Commissions? A. I am.

The Examiner: Now, the state of the record is that the question propounded and the answer of the witness is in the record and there is a motion pending to strike both from the record.

Now, I understood, Mr. Binford, you wanted to make some additional objections.

5063 Mr. Binford: I wish to add to that motion which has not been passed upon.

The Examiner: All right.

Mr. Binford: May I have the question read?

The Examiner: Yes.

(Question indicated was read back.)

Mr. Binford: As previously stated and in the form previously stated, I renew my motion to strike the question and answer upon which the Examiner reserved ruling, and upon that motion which has not yet been passed upon, we wish at this time to have

5064 the following additional grounds therefor:

First, that it has not been shown that the common ownership of the three companies suggested by the question has affected the methods of accounting and other practises mentioned in the question of the three companies.

Secondly, that the question upon its face shows that it is a continuation of an attempt to interject as an issue in this case the question of whether the particular evils which the Congress in Section 1 of the Holding Company Act of 1935 found to be wide-

spread and to call for the enactment of that Act are or have been particularly present in the case of the instant respondents.

The Examiner: In other words, you say it is irrelevant?

Mr. Binford: And therefore the question and all questions along that line are irrelevant to the issues in this case.

Thirdly, the testimony given by the witness, since the question was propounded, is still insufficient to 5066
establish a predicate for an answer thereto by him.

The Examiner: I am going to reserve ruling on this motion and will dispose of it before the direct examination of the witness is concluded.

By Mr. Browning:

Q. Mr. Van Derzee, has any of the three companies ever defaulted in the payment of interest or principal upon any obligation or in the payment of any dividend upon any preferred stock?

—2,221—

The Witness: No, there have been no defaults in 5067
the payment of interest or dividends on preferred stock.

Mr. Browning: I think we have reached a good stopping point, Mr. Examiner.

The Examiner: All right, we will recess until 10:00 o'clock tomorrow morning.

(Whereupon, at 4:40 o'clock p. m., the hearing adjourned to reconvene at 10.00 o'clock a. m., the following day.)

—2,222—

5068

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

5069

Hearing Room 1101,
Securities and Exchange Commission Building,
Washington, D. C.,
Tuesday, October 1, 1940

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before: W. E. SWIFT, *Trial Examiner.*

5070 Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD,

HERMAN O'DELL, and

MISS E. H. CALKINS, Attorneys on behalf of the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon, GOULD W. VAN DERZEE resumed the witness stand and testified as follows:

Direct Examination by Mr. Browning (Continued):

Q. At yesterday's hearing you gave some comparative statistics with respect to the depreciation provision and reserve of your three electric companies as compared with the 5072
average of 188 public utilities published by the Securities and Exchange Commission and you were asked to check the basis of these figures.

Will you please tell us the basis you used? A. All of the figures which I quoted for the three companies in the Wisconsin Michigan group and figures for the 188 companies I found in a report of the Public Utilities Division of the Securities and Exchange Commission entitled, "Financial Statistics for electric and gas subsidiaries of registered public utility holding companies, Year 1939", on page 3 thereof. In other words, all of the comparative figures were obtained 5073
from said volume and presumably are on the same basis.

The column that relates to the per cent. of operating revenue is headed, "Per cent. depreciation of operating revenue." The column that relates to the depreciation in per cent. of property is headed, "Per cent. depreciation of property", and the column relating to the accumulated reserve

is headed, "Per cent. depreciation reserve of property".

I understand that these percentages are taken from the income accounts with respect to revenue and the balance

sheet items with respect to depreciation so that they would, therefore, show depreciation insofar as it relates to a per cent. of property as a per cent. of property shown on the balance sheet as per books, it would be total property.

Q. At the close of the hearing yesterday I asked you whether any of the three electric companies had ever defaulted in the payment of any interest or principal on any indebtedness or in the payment of any dividends on preferred stock, and I am not sure that your answer covered the ques-
5075 tion of payment of principal.

Has there ever been any default in the payment of principal of any indebtedness? A. There has been no default in the payment of principal of any indebtedness. There is also another item that should probably be mentioned and that relates to the payment of preferred stock dividends. They have been paid continuously since 1900.

I did not mention that on the early issue of non-cumulative preferred stock which I believe was issued in 1896, no dividends were paid until approximately 1900 because I did not consider that failure to pay non-cumulative preferred
5076 dividends constituted a default.

—2,225—

By Mr. Hamilton:

Q. Mr. Van Derzee, will you refer to Respondents' Exhibit No. 32, being the map of the three companies, and particularly to the territory and transmission lines in and about the community of Cooks in Schoolcraft County, I believe, in Michigan, and the community of Michigamme, in Marquette County, Michigan.

Will you state whether the lines I have just referred to and the surrounding service territory were acquired

by Wisconsin Michigan Power Company pursuant to any particular plan of acquisition? A. The two lines to which you refer were acquired for the interests of Wisconsin Michigan Power Company if not immediately by Wisconsin Michigan Power Company, as a part of a general plan for a system in the upper peninsula.

It so happens that up to the present time conditions have been not just right for the interconnection of these two systems directly with the balance of the system but the lines are a part of the long-term program designed for inter- 5078
nection at the proper time.

We have had negotiations, particularly with respect to intervening properties in between the village of Cooks and the point where power is purchased from the Cliffs Power and Light Company relating to taking on more property now owned by others. These negotiations come to life periodically, in fact within the last few months I have

—2,226—

received letters from representatives of the ownership of the most substantial property in between Cooks and Cliffs asking if we are now ready to look into the matter further. We 5079
have replied that we are interested and it is primarily a question of price. That is where the matter stands at the moment.

The acquisition of more of the intervening property in between Cooks and the point where power is purchased by the Cliffs Power and Light Company for that line will be a material factor in the time that our lines may be extended from another point on the system so as to interconnect. We expect that that will be done, in fact I had to do with the laying out of the original line down to Cornell.

5080 If my recollection serves me right that is a 66,000-volt line and the high voltage was made available so as to provide a source of power beyond that point. When we originally acquired the system from Michigamme leading in a general westerly direction to the point on the map where power is purchased from the Cliffs Power Company, we had in mind ultimate connection across from Sidnaw to the west. It was about the time that we had acquired some substantial water power sites on the Sturgeon River which is in the township
5081 of Baraga and flows into Lake Superior.

The idea was that at the appropriate time we would make a development on the Sturgeon River and then run high voltage lines approximately due southeast towards Twin Falls where the 132,000-volt line of the company now

terminates, and would tap the line not now existant between Sidnaw and Michigamme to bolster up the voltage at that point.

We also had in mind at that time further extension of our own lines from some point near where Cliffs Power Company
5082 sells power to a point in the general neighborhood of Cornell, making a form of loop which would be advantageous in the supply of power entirely by our system if we should ever have outages that require rerouting of service.

Q. The map is stated to be of a scale of 10 miles to the inch. Would you approximate the distances between the transmission line terminating at Sidnaw and the transmission line originating at Michigamme? A. I would say about 30 miles.

Q. And similarly from the community of Channing in Dickinson County, to Michigamme? A. Between 20 and 25 miles.

5083

Q. And if you will, the approximate distance from the community of Perkins in Delta County, I believe, to the community of Cooks in Schoolcraft County? A. Between 25 and 30 miles.

Q. Both the transmission line running from Cooks and the transmission line running from Michigamme are connected with the system of Cliffs Power and Light Company, are they not? A. They are.

—2,228—

5084

By Mr. Browning:

Q. Does the management of your utilities involve problems of a diverse nature, Mr. Van Derzee? A. Yes, there is a great variety of problems in almost every field of activity. I have testified previously that financing involves quite a variety of very complex and continuing problems. The generation, transmission, and distribution of electricity involve many problems of a different kind and some of them are extremely technical in nature.

In the field of generation for example, the determination of the proper time at which to add additional generating capacity and the determination of the place at which such capacity shall be added are important problems, in fact they are major problems. Extensive studies are made of the costs and advantages of alternative locations at which plants may be placed in order to have the most effective and most efficient location and at the same time with due regard for the future requirements of the system.

5085

After we determine the location of a power plant there are a great many technical problems that have to be solved. They relate to the selection of the proper type of generator

and the discussion of the generator, itself, involves a good many problems. If it is a new station the question of the proper type of voltage and the proper steam pressure to be used in the turbine and the point at which the most load will be carried for the longest time comes into the picture.

—2,229—

If it is an 80,000 kw. turbine and your average load is going to be 60,000 kw. then you would be foolish not to design the turbine so that you get the maximum efficiency
5087 at three-quarters load.

There are a great many problems in the proper selection of boilers. There are innumerable problems in connection with the determination of the hundreds of auxiliaries of various kinds that go into the make-up of a station.

We had a little problem that may be of interest to you in connection with the determination of temperature of steam. It doesn't sound like an important problem but one of the engineers came to us and said, in effect, "We think that we ought to reconsider the steam temperature of the steam to be used. Instead of 825 degrees F. maybe we should go to 900
5088 degrees F."

Well, we said, "What does that involve?"

After examining the question with the boiler makers, the turbine makers, the makers of pipe, we found that altogether it would add about $100,000 to the cost of the additional capacity in order to raise the temperature 75 degrees. They found that with that increase in temperature we could probably save, say, $12,000 worth of coal per year so the problem of management was, Is $12,000 a year worth saving with an investment of $100,000?

5089

To the average engineer that looks like a 12 per cent. return but we can't overlook the fact that taxes and depreciation over the life of the property take fully half of that amount, leaving only a 6 per cent. return on the investment,

—2,230—

and if there are other places where $100,000 can be used to greater advantage that will help tend towards reduction in rates by accomplishing a larger saving than that, then that is the place for the $100,000 and not in equipment necessary to raise the temperature of steam 75 degrees.

5090

The general executive officers of the company don't make these studies but they direct that they be made and it is quite essential that the general executive officers be able to pass intelligently upon the problems that come before them of the nature that I have indicated.

A typical problem in the field of transmission would be the selection of suitable transmission line. We have such a problem now in connection with Port Washington No. 2. Should it be a wood pole "H" frame construction line with long spans of aluminum wire and a steel core, or should it be a steel tower line involving copper conductors, shorter spacing and smaller wire?

5091

In this particular case it happens that the company has need for a single circuit line, at least it has need for it at sometime connecting Port Washington and the Granville sub-station at the outskirts of Milwaukee. Right now we have one 80,000 kw. turbine and two transmission lines, each one of 90,000 k. v. a. capacity, so that if one line is out there is a reserve line to carry the output of the generator.

—2,231—

5092 The ultimate installation at Port Washington is expected to be four 80,000 kw machines. It is obvious that at such time we need at least the additional transmission line of 132,000 volts, so that in case of outage of one of the lines we will have one spare and the problem of whether we shall now put in that single circuit line which would be the fifth line upon the completion of the whole project, or whether we shall now put in a set of steel towers capable each of holding two circuits at greater present costs, is one of the
5093 problems of management in connection with transmission lines.

My own inclination is to save the money. While we think we are going to build a station to ultimate capacity one never knows. We haven't an abundance of available capital so I think the decision of the management will be that we will put in the "H" frame construction with a longer spacing, aluminum wire with steel core, and perhaps avoid an investment of $100,000 that would be involved in putting in steel towers capable ultimately of carrying two circuits.

5094 In connection with those problems there are such little minor engineering questions as what are the facts with respect to corona losses in transmission lines? The larger wire that goes with the aluminum construction and steel core has somewhat less corona losses than the smaller copper wires of the same conductivity, both operating with the same voltage and spacing, but that is not a particularly important problem in these determinations and I merely mention it to

indicate that there are diversion problems in what appears to be a simple field of transmission that involves engineering

knowledge for the executives to pass intelligently upon those things that are brought before them for decision.

A typical technical problem involving distribution of electricity we find in the downtown district of Milwaukee. We had to determine sometime ago whether we were going to continue direct current disfribution in the downtown district continuously or whether we should go to some other more economical form of distribution. Many large cities, in the downtown areas, have inherited the direct current system. It was the system originally designed by Mr. Edi- 5096
son and was known as the Edison Three-Wire Direct Current Distribution System.

In those days voltages were low; distances were short. 230 or 240 volts across the outside wires of the Three-wire system, that is from the positive to the negative, represented the voltage in use. Naturally when you start a system you have to continue it for sometime and so 240 volts between positive and negative wires has continued in the case of the downtown distribution system of Milwaukee, with 120 volts between either outside wire and the so-called neutral wire.

Power is taken off the 240 volt wires and lighting for 5097
the average incandescent bulb is taken off the circuit between the outside wire and the neutral wire.

—2,233—

The transmission of power by such a system in a downtown district was recognized a number of years ago to involve inherent disadvantages. Buildings were getting higher, air conditioning was beginning to be required by customers and lighting loads were growing with great rapidity. The source of direct current for these downtown buildings was from sub-stations. As a rule they are known

as converter sub-stations and in them are rotary converters which obtain their source of power from an alternating current line and such alternating current is converted into direct current required for the Edison Three-wire System.

The growth of direct current load means more sub-stations in downtown areas because you cannot transmit direct current long distances. The picture before the management was of buying very expensive downtown property with the possibility that zoning or other restrictions might not
5099 even permit the installation of such rotary converter sub-stations. It involved continuous extension from such sub-stations of larger and larger cables and more of them in order to supply the needs of these buildings that were continually going higher up into the air.

So we adopted, after considerable study, a long-term program of gradually converting the downtown area from direct current Edison Three-wire distribution system to the alternating current work system. We had in mind at that time that it might take 25 or 30 years to bring about the change.

5100 A great problem of management in connection with such an undertaking was to determine first what is the best

system to use, and then, how shall it be carried out? We didn't want to rush foolishly into such a program when we didn't need to. We had the consideration of making the old direct current equipment last its useful life. We had considerations of human nature to take into account and human nature is involved in problems of this kind.

Suppose we were to go to a large office building and

5101

say, "Well, we are just dead anxious to change you over from direct current to alternating current. The capacity of our direct current system is right up to the limit. We must make the change." The obvious answer of the building owners is, "Well, come on in boys, but don't charge us anything."

Right away you get into the problem of changing hundreds of pieces of expensive apparatus used by doctors, thousands of direct current motors to alternating current motors. They would even charge you for the sub-station 5102
space in the basement, so that isn't the method of approach, but somebody has to decide that.

I know of instances where that has been the method of approach and it has cost a great deal of money so we started early and the natural inclination of business and property owners in the downtown district was to come to the company and ask if they could at sometime have alternating current service; because we were still able to supply them with direct current we said, "Yes, you can have it in accordance with the rules that we have filed with the Public Service

 5103

Commission of Wisconsin," and that involved supplying alternating current service from the new A. C. network providing it was a new building, providing that the load was at least 75 kw., and there were some other conditions that were favorable, not so much to the company but to the ultimate customer.

It would not be fair to saddle onto the cost of other classes of service or even onto commercial service as such, the great expense of an ill-considered change from direct current to alternating current. Now we get the use of these

5104 large spaces in the basements of buildings under the sidewalks for nothing. They are glad to get the service and we make the change when we don't have to pay for the cost of changing the equipment of the customer. We expect to do it over a period of a great many years and to the ultimate advantage of the customers.

The technical reason why the expense is so much less for the alternating current system than the direct current system is that the capacity of a cable for carrying power is a
5105 direct function of the voltage impressed on the cable. If you have 13,200-volt cables, as we do servicing each one of these customer sub-stations in the alternating current network, it is obvious that with the same size of cable in the old ducts that carried direct current cables before, many times the amount of power can be transmitted.

Now, there are managerial problems of a different kind involved in the determination of sales policies. Engineer-
—2,236—
ing skill, without parallel sales push, would be useless. We would be all dressed up and no place to go, so it is important
5106 that some degree of intelligence be directed so far as we are capable to the determination of proper salesmen and policies. They involve at many stages the direction of the proper place to put your emphasis.

As an example of that, a number of years ago we saw a big field in electric water heating in the homes. We knew, first, that we had to have a very low rate for current in order to sell electric water heating. In order to get a low rate for current, you can't have very many fixed charges attached to the rate. The current is used at a time when

other people are not demanding service and that means largely in the night hours.

We developed a storage electric water heater. We had it made, as I believe I testified a few days ago, by the Hevi-Duty Electric Company because at that time you could not go to all the different manufacturers and just pick a well-developed electric water heater off the shelf. If that had been the case we would have had no occasion to be thinking about developing the electric water heater business. Somebody else would have already developed it and the manufacturers 5108
would have handled the problem, perhaps, but we found considerable usual delay.

We decided that the time during which the current could be used for heating the water in the homes was a period of ten hours ending at 7:30 in the morning and beginning at

—2,237—

9:30 the following day. With a period of ten hours for heating all the water you are going to use the next day, you have to have a fairly good-sized tank. We developed sizes of 50, 80, 120 and 160 gallon tanks and put suitable units in the bottom and top of them in order to get the water up to 140 5109
degrees in that 10-hour period and also in the case of unusual demand for water by the householder resulted we had another unit in the top of the tank which was connected directly across the house meter terminals and if the customer wanted heat in the daytime he had to pay the regular rates but very seldom was that the case.

The terminals supplying current to the lower unit were behind the meter because of a flat rate and we charged so-much for electric water heating service when you had a 50-gallon tank and so-much when an 80-gallon tank was used. The service was quite popular.

It developed, however, that because of the short time for heating water the cost of apparatus was greater because the tank had to be larger and so we set about later developing an alternative proposition involving a smaller tank and an increase in the hours of charging, so-called, from 10 to 16 a day. We picked out a period in the night when the current could be used without interfering with the distribution of the plant peaks and periods in the daytime such as the natural let-up of industrial activity at the noon hour and for quite
5111 a while thereafter, and together we have now a 16-hour charging period with an 88-mill rate for it and the cost of

—2,238—

water heating in the home is quite competitive and it is very popular. That represents one of the problems that management had to get in on. I, personally, worked extensively on that particular problem.

There are other types of managerial problems. The field of accounting requires managerial attention. It involves complex problems which require a knowledge of both accounting and engineering. Under the classification of ac-
5112 counts the Public Service Commission, effective January 1, 1938, companies were required to make comprehensive depreciation studies and to indicate within a certain period the justification for the type or method of depreciation accounting desired by the company, if it desired to differ in any way from straight line depreciation, which was practically laid down as preferential in the Classification of Accounts.

The determination to continue to use the sinking fund method which our companies had employed for a long time with the 3½ per cent. interest charge on reserve balances

was a managerial problem, with which the management was in close contact for a period of two and one-half years prior to the time that the Commission issued its order making the sinking fund method of depreciation accounting effective.

The management should be able to understand problems of that type and I am glad to say that not only the general executive officers understand the distinctions between straight line and sinking fund depreciation accounting with

its various ramifications, but that the executive committee 5114
as a whole has a good working knowledge of that subject and it was very much in discussion at the proper time.

We have borderline cases between capital expense and maintenance expenditures which find their way up to the management for discussion at least. Comptrollers are, of course, men who are by training and qualification best able to expound the subject of what is the proper account to use but sometimes a little knowledge of engineering and accounting and practical application of the thing that is being discussed goes a long way to clarify the mind of the accountant that may possibly not have had an engineering background. 5115

We have a problem just like that in the shop now. The generator winding of a 30,000-kw. unit at the Lakeside plant burned out. We were all much surprised to find that the cost of replacing that generator winding was $50,000 and we were quite shocked with the magnitude of that expenditure. We checked it up very carefully with friends of ours in the turbine business who had not made the turbine of which the coil burned out and they just told us off-hand, "That ought to cost about $48,000."

5116 *Gould W. Van Derzee—By Respondents—Direct*

Well, now we all know what units of property are, or we think we do. A unit of property is something that you can write out of the property account and replace by a charge for the new unit to capital and charge the old one to depreciation reserve and credit the reserve with whatever scrap

—2,240—

value there is in it and charge the reserve for the cost of removal.

Was this $50,000 expense in replacing a winding a capital
5117 charge or a maintenance charge? Well, notwithstanding the definition of units of property there are some collateral interpretations which read to the effect that improvements in what might be elements of property, if they affect the efficiency of the machine or the life of it, generally make a betterment out of it, can be considered as a capital investment. So there was a problem that the management had to face.

Should the cost be charged to maintenance or should the new winding be charged to capital and the old winding retired? These and many other accounting questions involving both engineering and accounting find their way to the desk of
5118 management.

(Discussion off the record.)

The Witness: We come to one of the last fields in which management has to delve and that is in the field of customer relations. In that field arise some of the more difficult problems of management. They are different from other problems because there are no set accounting and engineering rules by which the satisfaction of the customer with the service can really be determined.

After all, the customer is fundamentally interested in efficient service at low cost. He has no knowledge and probably has no interest in the problems that the company has. He does not care whether we use a

—2,241—

boiler made in Timbuctu or some other place. Of course, the over-all effect of good general management rebounds to his benefit, but he has not any particular interest in the details of how we accomplish that result. That is what he pays us for. He is too busy 5120 with his own problems to have any great concern in ours. He is a local customer dealing with a local company, manned by local people.

Thus we see the great diversity of problems which reach the desk of the management.

Mr. Browning: Will you please mark for identification this chart entitled, "Wisconsin Gas and Electric Company, Electric, Gas and Transportation Systems."

(Chart was marked for Identification as Respondents' Ex. 50.)

5121

By Mr. Browning:

Q. And does it correctly set forth the facts which it purports to set forth? A. It does.

Mr. Browning: I offer it in evidence as Respondents' Exhibit No. 50.

Mr. Binford: No objection.

The Examiner: This chart is admitted in evidence under the number assigned to it.

5122 *Gould W. Van Derzee—By Respondents—Direct*

(Chart admitted in Evidence as Respondents' Ex. 50.)

—2,242—

By Mr. Browning:

Q. Does the local character of your problems vary? A. Yes, the local character of our problems varies quite extensively but before going into the details of just how that variation occurs I think it would be well to get a certain
5123 amount of background which I can give you best by reference to the last exhibit which has just been presented.

The exhibit shows, by outlining, what the various divisions and districts of the operating territory are of Wisconsin Gas and Electric Company. This, I think, is a typical company having far-flung districts and I will now describe where these districts are and how the company is generally operated within the districts and divisions.

Starting at the lower right-hand corner of the map, the word "Kenosha". That refers to Kenosha County but you will find a line drawn north and south about through the
5124 letter "N" as it appears in Kenosha which is the west boundary of what we call the Kenosha division. The Kenosha division is generally that part of the county of Kenosha east of the line just described. The head office of the division is at the city of Kenosha. The division manager is Mr. H. M. Pauley who operates from that point. He is a man 52 years old and has been with the company for 23 years. This division is so relatively small that it is not necessary to have what are called local agents distributed throughout the property.

—2,243—

5125

The next division to the north is the Racine division. The Racine division is outlined in the color brown. The Racine division has its main division office at Racine. Mr. R. I. Swift operates from that point. He handles both the electric business of Wisconsin Electric Power in Racine and the gas business of Wisconsin Gas and Electric Company and the remaining business in the territory called the Racine division of Wisconsin Gas and Electric Company. Mr. Swift is 42 years old and has been with the company for 18 years.

5126

In Cudahy and South Milwaukee there is a gas distribution system and in the Racine division there is one superintendent of what is called the Cudahy district. Mr. M. Martinson is the superintendent of that gas district. Mr. Martinson is 38 years old and he has been with the company for 20 years.

The largest division of the company is the Western division. The head office of the Western division is at Fort Atkinson. At that point Mr. W. D. Leonard directs all of the operations of the Western division. Mr. Leonard is 55 years old. He has been with Wisconsin Gas and Electric Company for 13 years and with the predecessor municipal system for a great many years prior to that time.

5127

In the Western division are a number of districts and the first one of these is the Burlington district which is shown outlined in red, starting just to the west of the west line of the Kenosha division. The local superintendent in the Burlington district is Mr. F. Langley. Mr. Langley is 46

years old and has been with the company for 14 years. He lives in Burlington and I believe is acquainted with most all the people in the district. Mr. Langley, as a district man

5128 ager or superintendent, reports to Mr. Leonard, the division manager, and the district managers, in general, have about the same relation to their proper[illegible] as the division managers to theirs where there is no districts.

In the Burlington district you will see a small red circle way down near the state line. That is the location of the local agert and I shall tell you later more about what local agents do and at the present time merely indicate that they take care of the need of the customers in the districts in
5129 which they circulate.

The next district of the Burlington division, further west of the Burlington division, is the Whitewater district. The office of the Whitewater district is at Whitewater and Mr. H. F. Winnie is in charge. He is 44 years old and has been with the company for 26 years.

As we go along I shall point out that the location of these district offices is practically the same place that the only office that the predecessor companies had was located prior to the time that we acquired such companies as the Burlington Electric Light and Power Company and the White-
5130 water Electric Light Company.

—2,245—

In the Whitewater district Mr. Winnie has one local agent. He operates out of the village of Palmyra where you will see a solid blue circle.

—2,246—

The next district is the Fort Atkinson district, the headquarters of which are located at Fort Atkinson.

This district is under the supervision of Mr. E. E. Hein. Mr. Hein is 36 years old and has been with the Company for 12 years.

It is merely a circumstance and an appropriate one that Mr. Hein, the superintendent of the district, is at the same location as Mr. Leonard, the manager of the division.

The fourth district of the Western Division of Wisconsin Gas & Electric Company is known as the Watertown District, with head office at Watertown, under the direction of the district superintendent, Mr. E. T. Hornickle, who is 49 years old and has been with the Company for 22 years.

In Mr. Hornickle's district is a local agent at the village of Lowell. 5132

That location is up in the northern part of the district which is outlined in green.

There is also a Waukesha District, consisting of the city of Waukesha and in charge of that district is Mr. L. V. Schivursky.

Mr. Schivursky is 41 years old, has been with the Company for 15 years.

Out of that office are directed the affairs of what was once the old Waukesha Gas & Electric Company.

In the case of Watertown just described, we have a local

 5133

office, just as the old Watertown Gas & Electric Company had. That is possible where you service large areas out of one office.

Now we come to the Northern Division, and that is one of the typical divisions.

It has no districts, and for which reason there are a number of local agents.

I wish to describe to you, because it is typical, more of the detailed operations of this particular division. The division is in charge of Mr. W. E. Kuehlthau, who is 56 years of age.

Mr. Kuehlthau has been with the Wisconsin Gas & Electric Company for eight years, and he was with the predecessor company, which we acquired, for 32 years. So he has been in the public utility business for 40 years.

Mr. Kuehlthau's headquarters are located at West Bend, which is the so-called division headquarters. At that point Mr. Kuehlthau has an assistant division manager by the name of C. P. Strodthoff.

Under Mr. Kuehlthau and Mr. Strodthoff are all of the operations of the Northern Division.

One of the principal divisions of the work in the Northern Division is that of the chief clerk—Mr. R. S. Kelley. Mr. Kelley has under him some nineteen employees—a senior clerk, one figurer, one general clerk, one cash poster, one

machine biller, one addressograph operator, one balancer, one receiver, one prover, three credit and collection clerks, and two stenographers, one telephone operator, three meter readers and one stock checker.

That little group does practically everything that the Customers Accounts Division does in a large company. It takes care of all the operations, from meter reading to the collection of the bills for the entire district, except as it is necessary to make occasional check meter readings, and that is done by the local agent.

Then, under these two directors of the Northern Division, Messrs. Kuehlthau and Strodthoff, is a sales and promotion department, which operates as a unit.

In this sales and promotion department are seven service advisors, and this is the new form of service that has just recently been started in the Northern Division, and takes the place of the old sales representative plan.

These seven service advisors each have a district. They obtain new customers, answer rate or service complaints and inquiries, cooperate with dealers, demonstrate appliances, arrange and conduct group meetings of customers, sell merchandise, inventory customers' appliances, promote the use of service in all ways, attend sales office meetings as necessary, provide information for service connections.

If they happen to be in the field and are asked a question,

—2,249—

"How can I get service?" they take care of if they are right 5138 there.

Then, in addition to those seven service advisors, there is one lighting advisor, who works with all of the salesmen. This lighting advisor cooperates with the service advisors, sells the better-lighting idea, prepares lighting and wiring lay-outs, lectures on lighting and better wiring, cooperates with contractors and architects.

There are also other employees in the sales and promotional division consisting of a customer servicer and demonstrator, who demonstrates appliances that have been sold in homes, and conducts group cooking meetings, and a cus- 5139 tomer servicer and demonstrator who attends to the display room care, keeps all service advisor records, prepares reports, issues and follows up routine sales department work to and from the advisors, assists in home or group demonstrations, arranges for delivery and installation of certain equipment which is sold.

Those ten individuals in the sales and promotional department are a unit in themselves, detached from the balance of the Company, except with respect to the furtherance of the general policies laid down by the home office.

5140 They operate, in this Northern Division, just as if there were no other connection with the outside world.

They take care of everything that should be taken care of in the line of sales promotional work.

—2,250—

The third division we come to, which is under the direction of Messrs. Kuehlthau and Strodthoff, is that which relates to the installation of service and the maintenance thereof. There are two general foremen in this division, who
5141 report directly to the manager and assistant manager.

They in turn are responsible for an organization of 33 line foremen, linemen and ground men.

Of course, the number of that type of employees required depends upon whether you are in an expansion period and it is capable of being contracted; employees can be sent to other divisions if work is slack in this division.

In addition to the line foremen, linemen and ground men, there are six local agents.

These local agents carry out system operation as directed. They receive trouble calls. They inspect weekly street light-
5142 ing system records.

They also inspect the systems. They inspect sub-stations and large meters. They do collecting, supplementary meter reading, complaint investigating, remove and install meters, obtain change of name, set testing equipment, prepare orders to do minor work, gather information as requested, do miscellaneous appliance repair work, cooperate with service advisor and above all cooperate with the customer on the job.

By turning to the map you will note that there is a local agent at Elkhart Lake, where the solid red circle appears.

—2,251—

There is another in the northwest corner of the territory at a place called Lomira, and another almost due east at Random Lake.

There is a fourth at Thiensville and still another at Menomonee Falls in the south central portion of the Northern Division.

In this general division of the Northern Division, which takes care of the installation of service and the maintenance thereof, there are also four trouble men, who are available for use around the division—one appliance repair man, three 5144
meter testers, an engineering clerk who takes care of all the information necessary of an engineering nature, which may finally have to go to the home office for record purposes or approval of long line extensions by the general engineering department, one storekeeper, four storekeeper helpers, who do work of loading the various trucks and a substantial amount of other work, and one janitor.

So you see we have another complete section of operators in this division, which is completely capable of taking care of the requirements of service extension and the maintenance thereof, entirely divorced, except that it has to follow the 5145
engineering principles laid down in connection with the construction of lines, and has to receive certain executive approval for expenditures over a certain amount.

That, generally, describes the skeleton organization of

a division of Wisconsin Gas & Electric Company.

Now, we can come back to your question, "Do the local problems vary?"

There is no hard and fast rule about what is local. Perhaps the best way to state the matter is that things that are

5146 done locally are the things that need doing locally, and I can assure you that they are done.

Perhaps we should go further in this description and pick out some small town and a customer therein that enables us to describe more definitely the problems of a local customer.

I mentioned to you a little village up in the northwestern part of the Northern Division, called Lomira. Lomira is a typical small city. There is a local agent located in it.

5147 It is a rural village on Highway 41, a stop on a railroad known as The Soo Line. It has some small industries. It is in a dairy center.

There is a brewery there, a small feed mill, a hatchery, a small sub-station of Wisconsin Gas & Electric Company.

The population in the 1930 census was 603. It is estimated now that the population has increased to 641. There are 258 customers.

The Lomira Electric Light & Power Company formerly operated there and was acquired by Wisconsin Gas & Electric Company at the end of 1917.

5148

I have given you the information with respect to that company. Mr. Schmidtman has given you details with respect to downward trend in rates that occurred in connection with a large number of small companies immediately upon acquisition, and the facts with respect to the village of Lomira are that a cost of 40 kilowatt hours to the customer on the system of the old Lomira Electric Light & Power Company, before acquisition, was $4.83, and promptly after acquisition, wa· $2.74—a reduction of 43 per cent.

Now, we have a local agent at Lomira, and his name is Elmer Waechter.

He is 32 years old. He has been with the Company for 12 years, including the time that he spent with the predecessor company—Wisconsin Public Utility Company at West Bend. It just so happens that the manager of that division—Mr. Kuehlthau—had Elmer as one of his employees when the Wisconsin Public Utility Company was operating.

So those men have found important places in what has long since ceased to be a relatively new order of things, 5150
under Wisconsin Gas & Electric Company, but they go along with substantially the same relations to each other.

Elmer has been in Lomira since September 1, 1933.

By Mr. Browning:

Q. He has been the agent there? A. And during that period he has been the local agent. —2,254—

(Discussion off the record.)

A. (Continuing) Mr. Waechter has charge, as a local agent, of the operations of 2,111 customers in the area which he 5151
covers, being the area in and around Lomira.

The Examiner: We will have a short recess.

(Whereupon a short recess was taken.)

The Examiner: You may proceed.

By Mr. Browning:

Q. How does this local agent take care of the customers in Lomira? A. Well, suppose we do this by example, and that means we need to get a typical customer, and let's call

5152 her the Widow Smith, or Mrs. Smith. The question is, What are Mrs. Smith's needs?

Assume Mrs. Smith applies for electric service, how does she get it? How does she find out about appliances? Whom does she contact in case of trouble? How does she get her bills and how does she pay them?

Well, Elmer is the answer to her prayer. Suppose that Mrs. Smith has never used electric service. She decides that it would be a nice thing to do away with the old-fashioned
5153 methods—oil lamps, coal ranges. She calls in Elmer, who has been there a long time, and takes him into her confidence.

—2,255—

Elmer finds out generally how much money she can spend for wiring and for appliances, and knowing that, he goes to work on the problem for her, because he is a joint maintenance and salesman looking out for the interests of the company. Under the new set-up with the service advisors, he asks the service advisors also to call on Mrs. Smith and corroborate his judgment and give her additional information which such service advisors have with them in catalogues and in their
5154 minds and that is done while Elmer is getting a wiring contractor to make a bid on the wiring.

Finally, after conferences with the service advisor, Mrs. Smith knows that she would like to have, say, an iron, washing machine, electric grill, good lighting throughout the house, small electric refrigerator, vacuum cleaner and miscellaneous things in accordance with her pocketbook.

The local wire man makes an estimate on the cost of the wiring and finally the wiring is installed. In the meantime, Elmer has made arrangements with the district office at West Bend and on the date that service is wanted, which is after

the wiring has been installed and has been officially accepted by state inspection, the line crew of the company appears on the scene in connection with a routed plan for the day of doing the necessary work.

Then they have work in Theresa, a few miles away and work in Lomira and work in some other point after they get through with Lomira. The work is routed and it is always

—2,256—

possible to have a sufficient amount of advance notice so that work can be routed sufficiently. 5156

In case of real trouble, Elmer is a line man and he can climb a pole and put in emergency service himself with a little help he can pick up around the village, but the whole philosophy of this divisional operation is to do things efficiently in places where they can be done effectively and cheaply so in this particular instance, the service comes from the line crew with headquarters at West Bend.

The meter is installed or can be installed by Elmer and we come to the point where a customer is all ready for service and there is nothing left to do except turn the switch. She has had made available to her services that are necessary in 5157 the proper selection of the type of apparatus she should get, the kind of wiring to be put in, without stirring outside of the village of Lomira.

If she doesn't want to buy an electric grill or washing machine without actually seeing a larger number of samples that can be found in the local store, arrangements are made frequently by the service advisors to take the parties in their automobiles back to West Bend but usually a customer can see something installed in another customer's premises and doesn't have to go very far.

5158 He says, "I want one like that." Some time or other, Mrs.

—2,257—

Smith, after enjoying electric service, may have an outage. A fuse may blow in her home; something may happen due to a lightning storm that interrupts service. Now, how does she take care of that? Well, her first thought is of Elmer and she has Elmer's telephone number and she calls him and Elmer, being both educated as a trouble man and a line man is able to handle any minor trouble in the district.

5159 Of course, these troubles don't happen all at the same time. In case of very grave troubles due to an extensive sleet storm, then the entire resources of the divisional headquarters with all the trucks and the men are thrown into the work and service is restored practically as promptly as if that whole division was located at Lomira because with the hard concrete roads, there is very little travel time involved.

At least service is restored within all reasonable practical limits of time in which any customer could expect service to be restored and that is the test.

People are reasonable in those matters and their ideas of
5160 how quickly service should be restored are colored somewhat by the nature of the trouble that they can see visually.

Now, Mrs. Smith may have a complaint on her bill. The complaints are taken up to the service advisors that travel the territory or with the local agents and if it is necessary for the matter to be taken to the divisional office, that is taken care of entirely by these representatives who are local in the

—2,258—

field and Mrs. Smith does not have to go to West Bend in order to settle her complaints.

5161

The bills are mailed out of West Bend to Mrs. Smith and she can make payment at a local station or she can put it in an envelope and send it back to West Bend headquarters. In other words, Mrs. Smith enjoys local management, because all the contacts she needs and that she makes are handled locally. Now, there are other matters that are best handled in the district office.

We have pointed out some of those. To enumerate, for example, in the northern district office, we have the complete organization that handles the customers' accounts. We have 5162
the organization that extends the lines and services them. We have the sales office that takes care of all of the needs around the community.

These matters are handled in the district office or divisional office, as we call it, where there are no districts for the entire division, because they can best be handled there. Mrs. Smith would gain no advantage from having these matters handled more expensively in Lomira which can be better and more economically handled for the entire division in West Bend.

Still other matters are handled in the home office at Ra- 5163
cine. All of such work as the general sales department, which lays down the sales policies which are handled in the field; all of the general accounting work on the books, for example,

as distinguished from customer service accounting is handled at the home office at Racine; all of the general engineering work is handled at the Racine office for all of the divisions —gas, electric, heating, and transportation—and the general executive offices are located there, and they service the requirements of all of the operating divisions and utilities.

5164 The result is, as we have pointed out in previous testimony, substantial economies by spreading the efforts of the executives, the engineering department, general office division, the sales policy-making division, over all of the company. Obviously, Mrs. Smith would gain no advantage from the standpoint of service or rates from having these matters handled locally at tremendously increased costs.

She is blissfully unaware of such problems as depreciation accounting, reactance and capacity effects on trans-
5165 mission lines and the cost of a 90-day bank loan at a local bank. These are matters, of course, which ultimately reflect in the cost of service and redound to her benefit, but she is paying in her electric service bill an element of cost to see that these things are done right and there is no reason why she should be concerned with them.

The fact is that they are handled there at Racine because they can best be handled there.

There are some other matters that are handled in Milwaukee. For example, the work of the operating research bureau which has been described in previous testimony at
5166 —2,260—
some length, which does work for all of the companies.

There is a real estate department of Wisconsin Electric Power Company which does work for Wisconsin Gas & Electric Company. I remember seeing an order go through not long ago, asking that the real estate department, which was familiar with real estate matters in the territory served by Wisconsin Electric Power Company in Port Washington, obtain a right-of-way through the City of Port Washington, so that a high voltage Wisconsin Gas & Electric Company line could be built through the city to the terminals of the

sub-station adjacent to the power plant in order to ge a new source of power.

The real estate department of Wisconsin Electric Power Company was capable of doing that work cheaper and better than any representatives of Wisconsin Gas & Electric Company. Hence, the old test, Where can things be done cheaper and better? is applied.

We have at Milwaukee, an executive officer known as the president of Wisconsin Gas & Electric Company. We have two other vice presidents who are in the category of general 5168
executive officers. They are available for consultation and the fact is that Wisconsin Gas & Electric Company could not afford to pay the full time services of such men and the fact that they are available for such consulting services and are used at relatively small cost, just adds up the benefits which Mrs. Smith gets in Lomira. —2,261—

I think it must be obvious that such services as are performed in Milwaukee better than they can be performed for Wisconsin Gas & Electric Company elsewhere can not possibly detract from the local character of the management in Lomira. 5169

Still other matters are best handled outside of Wisconsin. For example, boilers for power plants can not be bought in Wisconsin. Western cedar poles, which grow in Idaho and on the Pacific slopes, have to come from without the state. A flotation of large bond issues for the properties must originate in the East. We can not buy boilers in Lomira or sell large bond issues there, but this fact does not detract one whit from the effectiveness of Elmer's local management.

The test on all these things is no geographical test, but where the matter can best be handled. By "best" we mean

5170 with maximum efficiency at lowest cost. This does not mean that the present arrangement is inflexible and final and not subject to change if and when changed conditions mean that something can be done better some other way at some other place.

On the contrary, we are always endeavoring to achieve important developments. We have an open mind. We can change our organization set-up any time.

I like to look at a divisional organization of Wisconsin
5171 Gas & Electric Company as being the ideal arrangement that we have made of the services required for these little companies. We have set down a local management in Lomira

—2,262—

where it is needed for their and surrounding territory. We have set down in West Bend the people who take care of the customer accounting business, the divisional sales offices, the men who take care of the extension of the lines and the maintenance of them, just as if he had the moulding of a new company in our hands. We can, in effect, mould it to our heart's desire by the mere change of the location of a local
5172 agent or a district office, and accomplish all of the things that are required for successful efficient service to the individual customer.

Both our customers' and our security holders' interests are to have such maximum efficiency at lowest cost. In the time that I have personally been with the property, since 1913, it has grown from an area of 305 square miles to 12,318 square miles, and the number of customers served has increased from 29,917 to 352,788.

The kilowatt hours sold to customers has increased from 62,732,315 kilowatt hours in 1913 to 1,317,564,313 kilowatt

hours per annum, but the problem is still essentially the same.

Where can the matter best be handled? That is our test. As my testimony shows, our history has been one of a combination of small companies, accompanied by improved service at lower cost.

We are, naturally, very proud of our results and we think

that we have good reasons for so being.

There are a substantial number of pioneer developments 5174
in the public utility field for which our group has been responsible. I want to just recite a few of these and I can do it because most of these results are what has been accomplished by either the whole organization or somebody other than myself. I think I would mention first, among the real fundamental benefits that have accrued through the efforts of our people, the use of pulverized coal as adapted to the central station industry.

Not long ago, when I was taking through the East Wells Street power plant, formerly known as the old Oneida power plant, a group of men who were interested in last securities 5175
issued that we got out, I pointed out to them a boiler that we had saved which bore a legend indicating that it was the first boiler to be operated by pulverized fuel in the world.

John Anderson, a canny and efficient Scotch engineer, originally conceived the idea of applying powdered fuel to boilers in the central station industry. Prior to that time, it had been thought that the use of pulverized fuel would do all sorts of damaging things to the brick work and other parts of the boiler, that it just couldn't be done.

5176 *Gould W. Van Derzee—By Respondents—Direct*

John was one of the types of individuals, of whom there are a lot in this country, who enjoy doing things that can't be done, and so he confided his hopes and aspirations to Mr.

—2,264-2,265—

Way, and together they set their heads to work on the problem of pulverized fuel in the industry. The way they did that was to take an old boiler, the one I just referred to at the old Oneida Street power plant, and experiment, together with one of the manufacturers who made up various pieces
5177 of apparatus in accordance with their design, and to see what could be done. It was a long, long experiment, and about four years were used in the development of all the necessary auxiliaries required to pulverize the coal to the fineness of talcum powder, to blow it into the boilers and to ignite it and to have the heat pass through the boiler in the most efficient, effective manner so as not to destroy the brick work, so as not to form slag in the bottom of the boilers and so as to generally operate as a medium for the production of economical steam for power generation.

At the end of the war, you may recollect that there was
5178 a decided shortage in capacity of plants, business began to boom. With our company in particular we had to make a decision on short notice that a new plant had to be built; we had some four or more mortgages on the property of The Milwaukee Electric Railway & Light Company and we couldn't get the money from that source and finally the idea was developed of forming Wisconsin Electric Power Company to own the Lakeside Power Plant which in turn would be leased to The Milwaukee Electric Railway & Light Company.

—2,266—

In connection with thoughts on that matter, Mr. Anderson and Mr. Way were giving a great deal of prayerful thought to whether or not they dared to risk putting up to the management of the company and the New York officers, the question of using powdered fuel in the new plant

They finally concluded that they should make such a recommendation, and one day there appeared at the New York office, Mr. John Anderson and Mr. S. B. Way, with the courage of their convictions and their recommendations that the new plant should be a powdered fuel plant, and they virtually staked their reputations and their jobs on the powdered 5180
fuel recommendation. I think it probably is putting it mildly to say that the men who heard them and who had not been close to this four years of experimentation were literally aghast that there was a new way and that they would recommend it to the extent that they did, but as time went on in the discussions, and it was shown that 20 per cent of the coal bill might be saved by this revolutionary process, the officers of the company in New York and The North American Company, which was really the one to risk its money, took the venture with these men who were risking their reputations 5181
and their jobs, and said, "We will back it up financially," and that was an epoch-making decision for the utility industry of this country.

It has saved millions of dollars. The story of how the first extension of the Lakeside Plant was begun late in February

and finished in December of the same year, bringing with it all of the new problems of design and the new form of burning coal, is an epoch-making action in itself.

5182 The plant was finished within a year, it operated satisfactorily, and since that time the central station industry has made tremendous strides, has saved millions of dollars to the everlasting credit, courage and perseverance of John Anderson and S. B. Way and The North American Company which made the experiment possible by putting out the money.

Q. Mr. Van Derzee, I don't think you mentioned where John Anderson came from. Was he brought to Milwaukee
5183 from Union Electric Company of Missouri? A. Yes. John Anderson was an engineer. He and Mr. Way were friends. Mr. Way, as I previously described, had been brought by The North American Company to Milwaukee Electric Railway & Light Company in 1911 and it wasn't long after that that Mr. Way arranged, through The North American Company, to release John Anderson from his work in St. Louis.

There were other collateral problems in steam generation which followed over the year, new developments which also have been revolutionary. The first installation of high pressure steam, 1,200 pounds pressure, at the Lakeside Plant, in-
5184 volved a great many new experimental problems.

The boiler worked from the very first minute it was put on the line and it was the initial and largest high pressure

—2,268—

steam boiler to be first operated successfully.

There were some others that were being experimented with at the same time; they were smaller; and it was a matter of years in one instance, before such boilers were operated satisfactorily elsewhere.

The radiant superheater was a development that followed the development of powdered fuel, in which the walls of the

inside of the boiler can be lined in part with tubes carrying the steam and thus perform, by radiant heating of such tubes, the purposes of the superheater, and accomplish other functions of helping to maintain the boiler walls cool at the same time.

Some other developments in other fields include the three-truck train. That was an invention of Mr. Way, working with the engineers of rolling stock department. At that time, we had a number of single cars on the railway system that were getting old. Mr. Way's idea was that two of these cars 5186
would be reconstructed and rejuvenated and held together by a single truck in the center, and with a vestibule passage between the cars so that there would be large carrying capacity at the time of the peak loads.

(Discussion off the record.)

A. (Continuing) A great number of old cars that might otherwise have been put on the scrap heap were thus rejuvenated and the last of the two-car three-truck trains is just being disposed of. They have performed a very valuable service over a period of ten or fifteen years. 5187

—2,269—

At the present time, as I have testified, we are gradually changing over the rail lines, as we have money, to trackless trolley lines or gas bus lines, as the case may be. That does not necessarily mean that we now have in mind that all of the lines will eventually be changed from street car service to bus service, but it is likely that many more will be and that there will be continuous change.

In other fields, we have developments of Hevi Duty Electric Company with which our sales department has been in

close contact, concerning which I testified at length a few days ago. One of these is the vertical carburizer, the metal alloy ten, and another alloy twenty, which I did not describe in my previous testimony, but which is now being developed by that company, in the hopes that it will replace the present type of nichrome wire and range units as a medium which will stand higher temperature and have longer life and be cheaper.

Not long before I left Milwaukee, Mr. Post, our vice
5189 president in charge of power, took up with me two developments which he thought ought to be patented that Mr. Dornbrook and the engineers had worked on.

We concluded that the ideas were probably patentable and that we should take out patents on them. These ideas relate to a new form of de-aerator, taking air out of boiler feed-water, and a new improvement on a certain type of valve for power plant work. —2,270—

I have passed over a long period of experimentation which finally resulted in the issuance of American and British patents on a process of taking out of coal, gas which
5190 could be used as an illuminating gas, various residuals which have by-product value, and powdered coke which would be the end result to be burned under the boilers instead of powdered coal.

Experimental models were built and tried and the patent has been kept on ice awaiting a time that it might be used advantageously.

There are many other developments and improvements which have been made by our engineers in various fields, working with manufacturers, which we have not sought to patent.

5191

I remember one not long ago with respect to certain features of installing high pressure tubes in the boiler drum which we decided the manufacturer could patent if he would give us the right to use that improvement in design which we were really responsible for without the future royalties. This he readily agreed to.

Q. Will you tell us what is the Coffin Award? A. Probably the Coffin Award can best be described by giving the citation which Wisconsin Electric Power Company received last June at the annual convention of the Edison Electric 5192
Institute covering performances in the year 1938:

> "The Prize Awards Committee administers the Charles A. Coffin Award and it is now my privilege
>
> —2,271—
>
> to announce the winner of the 1938 award.
>
> "This award, established in 1922 by the General Electric Company as a tribute to the memory of the late Charles A. Coffin, founder of that company and one of the great leaders in the electrical industry, each year goes to that company which has made a 5193
> distinguished contribution to the development of the electric light and power industries for the convenience of the public and the benefit of the industry.
>
> "The winning of this award is considered a very great honor and distinction and it is deservedly the most highly prized award for which electric utilities can compete. The Committee of Judges this year were confronted with an unusually difficult task because of the excellence of the exhibits submitted for the award and the strong claims which each of the

six contesting companies was able to put forward to warrant its selection as winner.

"In reviewing the presentations, the judges have been definitely impressed with the splendid evidence of diligence and capable efforts to bring about improvements in service and to contribute benefits both to the public and to the industry.

"It gives me pleasure to announce the unanimous decision of the judges, consisting of Dr. Carl T. Comp-
5195 ton, president of Massachusetts Institute of Technology, A. C. Marshall, vice president and general man-
—2,272—
ager of Detroit-Edison Company, and your chairman of the Prize Awards Committee, which, for outstanding accomplishments during the year 1938, awards the Charles A. Coffin medal to the Wisconsin Electric Power Company.

"This company has made distinguished contributions to the technical development of this industry in efficiency, power generation and in power sales to
5196 the public.

"In 1938, Wisconsin Electric Power Company's combined generating plants produced electric energy at the remarkably low yearly average of 13,677 B. t. u. per kilowatt hour, and the yearly average for its low cost Port Washington generating station was only 10,788 B. t. u. per kilowatt hour, a world's record for this class of station.

"Efficiency in handling customers' accounts from meter reading to collecting has enabled the company to reduce the cost per bill to a remarkably low level.

"The company's record in the sale of power for industrial, commercial, domestic, and rural purposes, is outstanding. It has achieved most effective and satisfactory cooperation with dealers in electrical merchandise. The company has established good relations with the public, it has built up good employee relations and placed them on a sound basis. It has achieved an excellent safety record with no fatal accidents in a period of five years.

—2,273— 5198

"In 1938, the company effected a reorganization and refinancing plan which has placed it in a strong financial position and materially reduced its fixed charges. The public which this company serves has benefited greatly and will continue to benefit from its achievements.

"The industry likewise has benefited and will continue to do so."

The individual who is being quoted as delivering this citation and who was the third member of the committee 5199 was Mr. Liversidge, chairman of the Prize Awards Committee of the Edison Electric Institute Convention and president of the Philadelphia Electric Company.

It so happens that the receipt of the Coffin Award by one of our three companies was not the first time that our Wisconsin-Michigan group had been so honored. Prior to the time that the separation of the companies was made and the former Milwaukee Electric Railway & Light Company was in existence, that company received the companion award to the electric award from the American Transit Association for

5200 the same type of performance in the interests of the public in the transportation field.

Mr. Browning: Read the last answer please.

(Whereupon, the above recorded answer was read by the reporter.)

The Witness: Thus Wisconsin Electric Power Company and its predecessor constitute the only company

—2,274—

5201 that has ever received the two awards.

By Mr. Browning:

Q. Has your group of companies received a further award while you have been testifying here? A. Yes. During the past week, the American Transit Association met at its annual convention and The Milwaukee Electric Railway & Transport Company received an award made by the Transit Journal.

The plaque which it received as evidence of this award reads as follows:

5202 "Maintenance award presented to The Milwaukee Electric Railway & Transport Company for its contribution to the improvement of maintenance policies in the transportation industry through participation in the Transit Journal maintenance contest of 1940.

Mr. Browning: This is a good stopping point.

The Examiner: Very well, we will recess until 2:00 o'clock.

(Whereupon, at 12:30 o'clock p. m., the hearing recessed until 2:00 o'clock p. m., the same day.)

—2,275—

AFTERNOON SESSION

The Examiner: Let us resume.

Whereupon, GOULD W. VAN DERZEE resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

Q. You outlined this morning, in some detail, the principles and methods which you apply with respect to local 5204
management in the case of Wisconsin Gas and Electric Company. Are the same general principles and methods applied in the cases of Wisconsin Electric Power Company and Wisconsin Michigan Power Company? A. Yes, the same underlying principles apply. The actual operations differ somewhat. Wisconsin Michigan Power Company is more like Wisconsin Gas and Electric Company in its divisional operations. Wisconsin Electric Power Company is somewhat more compact but even that company has a large number of local agents who perform the same general character of work for customers as do the local agents in Wisconsin Gas and Elec- 5205
tric Company territory.

Q. You adapt the general principles to particular factual situations? A. We do. Always our endeavor is to do best locally what can best be done locally.

Q. Has The North American Company been of any assistance to your companies in their management problems? A.

—2,276—

Yes, The North American Company has been of great assistance to our companies down through the years. With respect to financing matters we have always had at our disposal the

services of The North American staff. In financing we have availed ourselves completely of such service.

The North American officers have not only followed security markets and developments for us, but have usually planned and carried out most of our financing on down through the years. While we have helped from time to time locally, we do not pretend to keep in Milwaukee a financial staff such as The North American Company has.

There is only one Mr. Fogarty, only one Mr. Freeman,
5207 only one Mr. Piske, and only one of a number of other people who are skilled and have a high reputation in financial work in the New York office.

Q. Would the maintenance of a comparable financial staff in Milwaukee involve any additional expense to your companies? A. Well, obviously to maintain such a financial staff in Milwaukee would involve large additional expense because this field is a highly technical field. On account of the situation which has prevailed we therefore enjoy a considerable saving each year and the result is, as I testified recently, that the officers are free to do more on various
5208 operating properties and perhaps that has had something to do with the great technical developments that have resulted.

—2,277—

Personally, I am only the general manager. I don't pretend to be an expert in general financial matters. If we were to set up a financial staff in Milwaukee we would not keep it busy on financial matters because we don't have enough of such problems.

I would like to give you one example of North American aid to us in financing and that relates to the Wisconsin Michigan Power Company merger in financing in 1927. I would

like to give this in detail because only by going through some of the details of a typical job of financing can a full appreciation be gained of just what help The North American Company has been on down through the years.

Mr. Buswell: What was the date of this financing?

The Witness: 1927.

The North American officers have developed and directed the program which resulted in the combination of the properties of 12 small companies with two larger companies in Wisconsin, and the upper peninsula of Michigan, the elimination of 13 of those corporate entities, leaving one financially stronger company, namely the Wisconsin Michigan Power Company. 5210

The power generating and transmission system owned by Wisconsin Michigan Power Company, upon consummation of the plan, was connected with the system of the Wisconsin Gas and Electric Company, and The Milwaukee Electric Railway and Light Company to the south, providing the exchange of power

—2,278— 5211

which has already been described.

To the many problems involved in effecting this desirable reorganization, questions of State laws, mortgage liens, elimination of outstanding preferred stock, transfer of assets and franchises and assumption of liabilities, merger of certain of the companies, creation of senior and junior security financing media; to all of these and others the answers were found by The North American Company.

5212 *Colloquy*

The plan as finally developed involved the acquisition by Peninsular Power Company of all the property, assets and franchises of six Michigan corporations operating electric utilities in the northern peninsula of Michigan, certain water power property on the Menominee River, known as Pemene Dam site, owned by Wisconsin Gas and Electric Company; a certain sub-station and adjacent property at Appleton, owned by Wisconsin General Railway, and certain property
5213 owned by Utility Realty Corporation; the merger by Peninsular Power Company of five Wisconsin corporations owning and operating electric utilities, utility property or water power property in Wisconsin, the creation of a new mortgage and the issuance thereunder of $5,000,000 of bonds, the issuance of $1,275,000 par value of six per cent. preferred stock, and $5,225,000 par value of common stock, of which $1,200,000 par value was exchanged for common stock then outstanding and owned by the holding company;

—2,279—

5214 the merger of Wisconsin Traction, Light, Heat and Power Company, a Wisconsin Corporation owning and operating an extensive electric utility in the Fox River valley, and an electric railway system in and about Appleton.

The major companies in the group were two Wisconsin companies, Peninsular Power Company with total assets as of December 31, 1926, of over $6,800,000, and Wisconsin Traction, Light, Heat and Power Company, with total assets of over $9,300,000.

5215

Peninsular Power Company had no funded debt outstanding except $200,000, principal amount of eight per cent. serial notes, its $471,000 of outstanding bonds having been retired in November, 1926. It had $1,650,000 par value of seven per cent. preferred stock and $1,200,000 par value of common stock outstanding.

Under the plant, the charter of Peninsular Power Company was amended to provide for $13,000,000 par value of stock, of which $6,000,000 par value was pre- 5216
ferred stock issuable in series, and $7,000,000 par value of common stock.

The name of the company was changed to Wisconsin Michigan Power Company. Creation of this serial preferred stock provided a junior security financing medium which enabled the company to provide its financing requirements from that source from time to time.

Wisconsin Traction, Light, Heat and Power Company had outstanding $3,000,000 principal amount of

—2,280— 5217

first mortgage bonds due July 1, 1931, of which $1,500,000 bore five per cent. and $1,500,000 bore seven and one-half per cent. interest, in addition to its outstanding stock, all of which was acquired in part from the North American Edison Company by the Peninsular Power Company prior to merger.

Attention had been given by the officers of North American and officers of its Wisconsin subsidiaries for considerable time to the general situation from the end of 1925. A preliminary plan had contem-

plated acquisition of Wisconsin Traction, Light, Heat and Power Company by Wisconsin Gas and Electric Company.

In 1926 plans were prepared and several times revised, looking towards the merger of Wisconsin Traction, Light, Heat and Power Company by Peninsular Power Company. The major obstacle to any such merger was the existence of the Traction Company's mortgage, since it was felt by counsel that the
5219 lien of that mortgage might extend to the property of any company with which the Traction Company might be merged.

Because of the ten per cent. redemption premium on the Traction Company's bonds and the necessity of paying the additional interest on coupons to maturity, redemption of those bonds and the satisfaction of the mortgage were out of the question. After careful consideration it was concluded that a new first mortgage should be created for the Power Company prior to

5220 the merger.

Numerous intricate problems arose in effecting the consolidation of the companies involved. Under the State laws, Michigan corporations could not be merged with Wisconsin corporations. Accordingly, it was arranged to have Wisconsin Michigan Power Company acquire all of the property, assets and franchises of the Michigan corporations and assume their liabilities. The ownership of the stocks of the Wisconsin corporations was vested in Wisconsin Michigan Power Company.

Colloquy

Many questions of mortgage, bond and preferred stock redemption, franchises, etc., of the various companies, were sucessfully solved after many months of careful planning and intensive work. 5221

The holding company not only assisted in the solution of these questions but also assisted in the acquisition of some of the companies. A new mortgage was developed by the North American officers with counsel and reviewed by the Wisconsin Companies' officers and counsel. 5222

In addition to many general improvements over the Power and Traction Company's previous mortgages, such as being an open-end mortgage and mortgage providing for the issuance of bonds in series, it hurdled the problem arising from the existence of the Traction Company as a separate corporate entity and the spreading of the lien of that company's mortgage to the Power Company's property by including a covenant of the Power Company, within six months, to

—2,282—

merge the Traction Company or acquire substantially 5223 all of its assets and thereupon to convey to the new mortgage trustee the Traction property in accordance with a supplemental indenture, the form of which was stipulated when the mortgage was executed.

The property owned by the Traction Company on June 14, 1927, so to be conveyed, was also specifically excluded from the term "property additions" as a further protection to bond holders, so that no additional bonds would be issued against that property,

5224 *Colloquy*

and provision was made that the Traction Company mortgage was not deemed to be an underlying mortgage until the Power Company should have conveyed the Traction Company property to the trustee of the new mortgage as above provided.

Certain property of Wisconsin Traction, Light, Heat and Power Company, on which a power plant of the Company was located, was not owned but was used pursuant to long-term lease with the Green Bay
5225 and Mississippi Canal Company. These leases were assigned to Wisconsin Michigan Power Company and then conveyed to the trustee of the new mortgage as further security for the bonds.

While the recording of a mortgage in public offices is normally a routine matter, the recording of the new mortgage and the supplemental indenture was a matter in which time was the essence. Counsel had advised that in order to avoid any question as to the lien

5226 of the Traction Company mortgage applying to the properties of the Power Company prior to the lien of its new mortgage, the new mortgage should be filed for record wherever necessary before the merger of the Traction Company had been effected.

Because of the softening of the bond market with the possibility of still further softening, because of the large amount of then recent security issues still undigested, the investment bankers wished to offer the new bonds at the earliest possible date in order to maintain the price agreed upon for their offering

to the public. If the offering had been postponed to a time which would make it impossible to sell the bonds at that price, because of market conditions, it would have been necessary to re-trade the price with the bankers or postpone the offering until the market would take the bonds at the original price, which was 99.

(Discussion off the record.)

A. (Continuing) It was necessary that the merger of all of 5228
the other properties be effected and properly recorded before the Traction Company was merged. Then that Company had to be merged and some more recording done, all preparatory to formal delivery of the bonds required to help finance the re-organization. Everything was in a hurry. The holding company did its part and the operating company finished the job.

—2,284—

The time schedule was laid out by the North American officers and through minute men cooperation of the Wisconsin staff was successfully carried out in spite of the fact 5229
that ten counties in Wisconsin, in addition to the office of the Secretary of State, and five counties in Michigan, were involved and the Recorder's offices in the various counties were at remote and inaccessible points.

The mortgage and supplemental indenture were signed on behalf of the Company and the trustee in New York, on Saturday, June 25. That was in 1927.

The Holding Company dispatched 22 counterparts by messenger on a fast train. Within a minute after his

arrival in Milwaukee at 12:30 p. m., Sunday, June 26, men were speeding to the far-flung points with the result that the documents were received for record on June 27 at 8:00 a. m. in Oconto County, at 8:02 a: m. in Winnebago County, and had been received in all of the Wisconsin counties by shortly after 11:00 a. m.

A Directors' meeting was then held in Milwaukee to merge the Traction Company with the Power Company and a certificate of merger, recording such action, was rushed
5231 to Madison and filed with the Secretary of State. Promptly thereafter an additional supplemental indenture conveying the Traction Company property to the new mortgage trustee was executed in New York and rushed out to Lansing, Michigan, where it was required at a hearing to determine

the Michigan State mortgage tax before 10:00 a. m. on Wednesday, June 29.

After the hearing they were sped to Milwaukee and on to the County offices for recording.

The Holding Company had notably developed the plan of
5232 financing and advanced $7,800,000 to the Power Company and the Traction Company to enable the acquisition of the various properties involved and the redemption of the Power Company's preferred stock, and payment of certain of its indebtedness, but in order that the Power Company might have the benefit of issuing and selling $5,000,000 of its new bonds prior to an acquisition of the assets of the Traction Company, the Holding Company, North American Edison Company purchased the bonds forthwith and agreed with the investment bankers to resell the bonds to them at the same price after the acquisition of the Traction Company's

assets, the bankers being willing to buy at that price only after those assets had been acquired.

Under the mortgage covenant above referred to, the Power Company was required to acquire those assets within six months. However, under the time schedule worked out in New York, the merger was successfully consummated within two days after the mortgage was executed and within 10 days thereafter the bonds had been delivered to the investment bankers.

In furtherance of the improved financial structure of 5234

—2,286—

the Wisconsin Michigan Power Company, the plan also involved the creation of serial preferred stock, of which $1,275,000 par value of six per cent. series was purchased by the Holding Company, North American Edison Company, at par.

The serial preferred stock created by charter amendment in June of 1927, of which $6,000,000 par value was authorized by the amendment, provided a junior security financing medium which was effectively used for a long period of years. 5235

By Mr. Browning:

Q. Do your companies have any contacts with North American Executives on matters other than financing? A. Yes, they do. We are in constant contact and consultation with North American Company Executives. Some examples of which—a few may have been previously recited—include the recent and extensive conversations in New York concerning the advisability of Wisconsin Electric Power Com-

5236 *Gould W. Van Derzee—By Respondents—Direct*

pany proceeding to plan on 80,000 kilowatts of additional generating capacity.

We have had recent discussions on budgets and other accounting matters, on purchasing policies, and just at the present time conversations are going on with respect to handling problems that arise out of the Selective Service Act.

There are innumerable contacts of various kinds on all the phases of the business between the officers of our com-
5237 panies and the North American Company. Sometimes we get special help from them. The best instance of that is the time that Mr. Doolittle spent a number of months in Milwaukee about the year 1925 working on the so-called service

—2,287—

at cost contract.

That contract was an arrangement which was to be voted on at the referendum under which the voters would decide whether the city should make a contract with the Company covering service at costs. Mr. Doolittle has also been out with us on other occasions. One that I remember at which he
5238 stayed several days was early in 1938 when he acted as our witness in a hearing before the Public Service Commission on depreciation methods.

Q. Do your companies have contacts with other North American subsidiaries? A. Yes, we have direct contacts with other North American Company subsidiaries. We get general help from the pooling of technical information. One of the ways is through the inter-company committees, the Electrical Committee, Station Advisory Committee, the Accounting Committee, and the Committee of Purchasing Agents.

Q. Could you give us some examples of help which your companies have received through such sources? A. The experience of the other North American companies, that is, subsidiaries, has been valuable in connection with contemplated employment of outside forces for inspection and maintenance work. A few years ago when we were seriously considering employing a certain firm for bushing testing work on our sys-

—2,288—

tem, we were influenced against contracting for such services by experiences of other companies with the same organiza- 5240
tion. Instead, we acquired equipment and assigned one of our own employees to testing work. We feel that the work being done with our own organization is effectively meeting operating requirements and the estimated savings is approximately $1500 per year.

Obviously this information we received was highly confidential and could only have been obtained from companies with which we were very closely associated.

As a result of inquiry on types of load-limiting resistors employed by other companies in starting rotary converters and the receipt of information from Cleveland regarding a 5241
satisfactory load-limiting resistor constructed in their own shops, we undertook the construction of such limiting load resistors with the result that we saved approximately $20,000 on one of them and we have since constructed five

A load-limiting resistor is a device consisting principally of resistance which is a necessary adjunct to a rotary converter if there is no battery connected with the system. When you have a rotary converter starting with no load and you endeavor to take load quickly without a load-limiting resistor, you get a flash-over in the rotary.

—2,289—

5242 *Gould W. Van Derzee—By Respondents—Direct*

The other companies have been of service to us in connection with extensive studies made from time to time on practices relative to reconditioning of transformer oil. Confidential information from other companies deterred us from installation of an activated alumina process for reclaiming and reducing acid content of transformer oil.

Figures on economies, which we compiled, suggested that if the equipment would function satisfactorily as claims made for it, we would be justified in making an investment of about
5243 $8,000.00 for the installation.

Due to the reporting unsatisfactory functioning of the process, where it was tried out in St. Louis, we did not go ahead with our proposed recommendations.

St. Louis' experience indicated that activated alumina process for reducing oil, acidity, gave good results for newly conditioned oil, but that after a few weeks in actual service, such conditioned oil showed a marked tendency to return to its original acid content.

As a result of experience of the various companies regarding frequency of inspection on certain construction practices
5244 on fault bus systems, we were prompted to make a detailed inspection of our own fault bus system at Lakeside. As a result of this inspection, certain connections and practices were discovered and changes made to improve the protection. These corrections eliminated possible failure of the fault bus

system to function as intended, with possible extensive damage to equipment.

The fault bus system is a general arrangement whose primary object is to trip out certain switches faster than they

might ordinarily trip out with another kind of trouble due to their delayed action timing.

Studies are sometimes prepared, incorporating the experience of all companies on certain matters. One such subject was Diesel power which was assembled by the Cleveland Electric Illuminating Company. Two reports were made entitled, "Diesel Engine Power Costs," and "Package Diesel Engine Costs."

Copies of these reports were turned over to our power sales department for use in competing with Diesel power. St. 5246
Louis developed a method of cleaning turbine blading with dry pulverized fuel, ash and air. This method does a very good job of cleaning turbine blading, being by far superior to sand blasting, as it does not mar or scratch the metal, but it creates a very unpleasant dust condition.

Milwaukee took the matter up at that point and experimented further by using water, pulverized fuel, ash and air. This was done by mixing the water and the pulverized fuel ash, in a tank by means of a mechanical agitator, thereby keeping the ash in suspension and then feeding this mixture into an air gun, and blowing it onto the surface of the turbine 5247
blades. Use of this method by the different companies brought further improvement.

—2,291—

Instead of a mechanical agitator, the air used is first blown through the tank containing the ash and the water, causing an agitation, and then feeding the complete mixture of water, ash and air to the nozzle used in spraying against the turbine blade.

All companies experience trouble with pulverized fuel in storage bins, becoming in a muddy state due to condensa-

5248 tion taking place. This caused clogging of feeders, thereby reducing boiler capacity. It also caused corrosion of steel work on the bunkers.

We found, on inspection of our own bunkers, that there was one of the main roof girders that was becoming quite seriously corroded on account of the moisture that had condensed in the pulverized fuel bin adjacent to this steel girder.

Cleveland devised a method that remedied this condition by insulating the bins. We, therefore, lined several of our
5249 bins with insulation, conducting tests, and from the result obtained from this have lined all of our pulverized fuel bins at Lakeside.

—2,292—

When the capacity of the roll type pulverizer mill is reduced by reason of the feed to the mill being reduced, there is a tendency of the rolls to strike the grinding ring creating a metal-to-metal contact.

Mr. Browning: Will you please read that last?

(Whereupon, the above recorded answer was
5250 read by the reporter.)

The Witness: You see, here is what happens, and I am illustrating with my hands. There is a grinding ring inside of the pulverizer mill and a set of rolls comes along on the inside and rolls on the interior grinding surface and powdered coal comes down between. (Indicating)

When there isn't very much powdered coal, I am trying to say that the roll impinges on the ring and obviously tends to wear it out and what the boys did was to get together on some form of restraining har-

ness which would keep the roll back at a time when there was not much of the pulverized coal flowing down to the ground and thus prevent the wear.

By Mr. Browning:

Q. You developed the solution for that difficulty in Milwaukee? A. Yes.

Q. And passed it on to the other subsidiaries? A. Yes. Recently, Potomac Electric Power Company orginated the plan of flow controls for contact heaters at the Buzzard 5252

Point Station. This is a different set-up than we have in any of our high pressure stations in that the heaters are tray type instead of tube type.

This diagram has been turned over to our engineering division to determine what advantages it might have over our installations and also what disadvantages there are in an installation of this kind.

These contact heaters are trays of feed-water, which comes in contact with live steam, whereas the ones that we are using are tubes with the water inside and the steam 5253 flowing over the outside. This diagram referred to relates to the method of controlling the flow of the steam over the water and there may be a good deal in it and we are trying to find that out.

Q. Will you tell us something about the accounting committee? A. About two months ago, or perhaps a little longer, the so-called budget sub-committee of the accounting committee of the subsidiaries of North American Company met in Milwaukee. Mr. John Dockendorf is the chairman

of the sub-committee and the general purpose of this committee meeting in Milwaukee as distinguished from meeting in one of the other properties was because Milwaukee has probably gone a little further than some of the other companies in its method of budget control.

I was very much interested in the meeting and am always much interested in budget control work, so I was asked to

—2,294—

5255 address the meeting at its opening and I spent about three-quarters of an hour talking to the assembled group on the working functions of a budget, how you can really control the business, how the budgets ought to be devised, going down the line as far as possible, getting everybody interested in them, passing on the ideas up the line.

I think that a great deal of value is coming out of more intensive budget work. I mention this budget committee because I happen to have been present at it myself and because it is only one phase of the work which is being done by the accounting committee.

5256 On September 16, the entire committee known as the accounting committee, also met in Milwaukee and I had the pleasure of attending that meeting. There were present at the meeting Mr. A. H. Shettler, controller, Union Electric Company of Missouri; R. H. Smith, controller, Cleveland Electric Power Company.

Q. What is that name? Shouldn't that read Cleveland Electric Illuminating Company? A. Here it says Cleveland Electric Power Company. That is'nt right though.

Q. What company is it?

The Examiner: You intended to say "Illuminating Company" instead of "Electric Company"?

The Witness: Cleveland Electric Illuminating Company.

A. (Continuing) H. G. Haydon, controller, Electric Power —2,295—
Company; J. H. Keys, controller, Illinois-Iowa Power Company; F. M. Bocher, assistant treasurer, Kansas Power & Company; J. H. Keys, controller, Illinois-Iowa Power Company; 5258
F. M. Bocher, assistant treasurer, Kansas Power & Light Company; A. J. Bohl, controller, Wisconsin Electric Power Company; Linda Hollenbeck, chief accountant, Wisconsin Michigan Power Company; John Dockendorf, assistant research engineer, Wisconsin Electric Power Company, and also representing Wisconsin Gas & Electric Company of which he is an employee.

I think it is important to give you an idea of the subjects which were covered at this meeting. There were operating and construction budget discussions. The progress to date on the 1941 budget was gone into. The present plans of 5259
the subsidiaries are to make budgets for an entire year ahead.

We are now preparing those budgets for the year 1941.

The question of budget forms was also discussed. In that connection, there was conversation concerning the use of estimates of the Federal Reserve Index. The Federal Reserve Board Index is an index of industrial activity.

You hear it expressed as 120 or 124 or some other figure, which is issued by the Board and depends upon the industrial activity that has prevailed in accordance with the formula of the Board during the past month.

Several of the companies among the subsidiaries have very substantial amounts of industrial power and the use of industrial power varies quite generally with industrial activity. Hence, it is important that in preparing budgets for the future we have some idea from experts on what the Federal

—2,296—

Reserve Board Index of Industrial Activity is likely to be, so we have obtained what we consider good counsel in that respect and it is the plan of the various companies to use a
5261 more or less uniform index of industrial activity in computing the estimated sales of industrial power in the budgets for the year 1941. There are, of course, situations peculiar to individual locations which may bring about a lag in business activity compared with a national boom, and those conditions are taken into account in applying the index to budget estimating in individual situations.

The subject of internal audits was discussed and under this heading the progress on organization of audit staffs was stressed. The audit staffs are being bolstered. Development of the audit program came in for considerable discussion and
5262 in this connection, the so-called flow diagrams or write-ups of departmental procedure were discussed.

Those are not the ordinary types of write-ups. Each department in each one of the companies is endeavoring to lay down these flow diagrams, the purpose of which is to chart the course of each financial transaction that originates in a department and which finally winds up on the books of the corporation, and when all of these are done, the so-called flow diagram descriptions will be used to see at what points audit work is necessary from time to time to best head off or catch any possibility of things going wrong.

—2,297—

5263

Another topic of discussion was the form of the president's monthly report to the Board of Directors, some details of which I have previously testified concerning.

Excess profits tax is another subject which was discussed, under the general headings "Necessity for Making Early Estimates," "Invested Capital Problems," "Desirability of having a Committee of Company Tax Experts meet to discuss the Problems," "Need for viewing every capital transaction in the light of the new tax law."

5264

Then construction overheads were discussed and the progress on the study of these overheads was enumerated by the different representatives.

There is a great variety of ways of handling construction overheads. What should interest during construction be? How should the general undistributed expense of the corporation be apportioned to capital monthly? And what items in the general undistributed groups should be used?

It is an important and helpful matter to have the counsel of all these representatives who are working on the same problems from different angles.

5265

Then, customers' accounting and collection expenses were reviewed. Since that subject first came up in an accounting meeting at which the system at Milwaukee was discussed, we have had several visits from a number of the different companies endeavoring to find out just what the process is. That

was described in the Coffin Award.

Sales promotion and general administrative expenses came in for their share of discussion to point out the differences in the costs of these groups of expenses between the different companies.

5266 *Gould W. Van Derzee—By Respondents—Direct*

Sometimes you think you are going along all right and that your expenses are at the proper level. When you come in contact with other companies that are doing about the same things and find that they do them cheaper and perhaps better, that is the time to look around.

The additional items which were up before the meeting, but which were not all of them wholly discussed to completion, were apportionment of stores to transportation expenses, reserve for extraordinary maintenance, spread of
5267 vacation expenses, handling of scrap materials, effect of selective service act on accounting organizations.

One of the interesting items in there is the spread of vacation expenses. We have been doing that in Milwaukee for a long time and it avoids having any large expenses on account of paying for vacations when there is no work done by our people during the summer time and each month there is a part of that yearly vacation expense that these men are allowed spread over the direct labor as an overhead.

I was particularly interested in the meeting of the accounting committee which I have just described and I made
5268 —2,299—
a point of talking to the representatives of each company.

I was very much impressed with the effectiveness of the meeting. While most, if not all of these companies attended other meetings of accounting organizations and societies, the great advantage of this kind of meeting is that each one is much interested in each other's topic, and each one has a chance to discuss the topic to a conclusion.

Questions can be asked freely and are answered without reticence. This is a far different thing from a formal society

5269

meeting where some formal papers are read to a much larger audience, with limited discussion and far less opportunity to question the speaker or to exchange detailed information as to current practices.

At the formal society meeting, much of the time is spent in listening to details which are interesting more to the speaker than to one's self, unless it just happens to click with the subject that you are very much interested in.

You have all been to meetings of that kind and you know that is a fact. One might attend meetings of professional 5270
accounting societies for a number of years and not cover even casually all the subjects that we discussed in two or three days of the meeting of the inter-company accounting committee which I have just described.

The value of such an inter-company meeting should be apparent when one realizes that here is that rarest of op-

—2,300—

portunities, the opportunity to sit down for an extended period and talk shop with the fellows who are doing the identical work in companies with the same problems and all interested in directing their attention to the same subject at 5271
the same time and to reach a conclusion.

There is no doubt that there is always inertia operating against a change in methods and procedures. It is always easier to follow the old way and to think it is best. If the opportunity is not present where a man is matching his own methods against those of other competent experts, he is likely to not make changes to more logical or economical methods. The fundamental thing which makes all this possible is, of course, the community of financial interest and

the fact that it is a common stockholder who is suggesting that we discuss methods and procedures with the other companies.

No company is going to disregard a suggestion made by its principal stockholder. Whether or not the suggestion is ultimately accepted the subsidiary is certainly going to study the question thoroughly before reaching its decision and not pass it off as it might in the case of the same suggestion being made by some disinterested third party.

5273 I have given only a few examples, but we have received assistance in many other such operating questions. The result of such committee activities is to make available to each company in The North American System the experience,

—2,301—

knowledge and ability of the engineering and operating staffs of all companies. It would be out of the question for any one company to maintain a separate or outside engineering staff comparable to this.

Q. Have you visited another subsidiary? A. Mr. Coffin, now our vice president in charge of sales, and then the sales
5274 manager, and I and Mr. LaPorte in charge of customers' accounts in 1927 visited the Union Electric Light——

(Discussion off the record.)

Mr. Binford: I object to any prompting of the witness as to the correct name of the company.

Mr. Browning: Mr. Examiner, may we call for the Commission's Exhibit which shows the corporate charts?

The Examiner: Yes.

5275

Mr. Hamilton: Are we off the record?

The Examiner: Off the record now.

(Discussion off the record.)

The Examiner: Let the record show that that chart is produced. Now go ahead, Mr. Browning.

Mr. Browning: I would like for the witness to complete his answer.

The Witness: I would like to add to my incompleted sentence, where I hesitated to recollect the name of the company I visited, the words, "& Power Company."

5276

—2,302—

Mr. Binford: Mr. Examiner, with respect to my last previous objection, I wish to withdraw any objection to the prompting by counsel for Respondents of the witness in respect to the names of these affiliated companies, but, of course, where such prompting is done, I will request that it appear of record that it is done.

The Examiner: Off the record now.

5277

(Discussion off the record.)

Mr. Browning: I would like the record to show that all I was endeavoring to do was to verify whether the exact corporate name was being used correctly and simply in the interests of greater accuracy in the record and I submit, Mr. Examiner, that nothing is to be gained by minor errors in the names of companies.

The Examiner: Well, let's go ahead and try to get along.

5278 *By Mr. Browning:*

Q. The company which you were describing owned the property now owned by Union Electric Company of Missouri and was the subsidiary of The North American Company at that time? A. Yes. The interesting thing about the visit to St. Louis to see Mr. C. E. Michel, sales manager, and the accounting people, was that we had been informed that St. Louis had the lowest customer accounting costs on the system.

5279 Hence, we wanted to find out just what caused these low customer accounting costs. We had a very pleasant stay there, as I recollect, and gained considerable information on

—2,303—

St. Louis methods with respect to customer billing and also with respect to sales matters.

A commentary on this situation is that just about the week before I left to come to Washington on this trip, St. Louis was up to our office, having heard about the Coffin Award and knowing about our accounting results, to see how we got that way.

5280 Q. Could you give us another example of such a visit? A. Mr. Schmidtman went to Cleveland in 1934, for three weeks on the municipal plant situation. A number of articles had appeared in one of the Milwaukee papers which we didn't think were quite correct concerning the matter of the Cleveland plant and we wanted to get at the facts.

We were received in Cleveland in very fine style and were given a great deal of information which was more or less confidential to the company with respect to the affairs of the municipal plant.

5281

Q. Have you borrowed personnel from another North American subsidiary? A. We have. The management of The Milwaukee Electric Railway & Light Company, in planning its promotional activities at the beginning of 1919, had decided that it would be a great benefit to its electric service customers and a substantial help to its load-building program, if it modernized its merchandise sales quarters and facilities

—2,304—

for the merchandising of electrical appliances, portable lamps and other equipment, and engaged in a somewhat broader merchandising program.

5282

The Milwaukee company needed some expert counsel in this undertaking and inasmuch as the Union Electric Light & Power Company of St. Louis had a merchandising manager of broad experience and reputation, who had successfully achieved and expanded the merchandising program of that company, arrangements were made through the offices of The North American Company for the St. Louis company to loan the services of its merchandising manager to the Milwaukee company on a part-time basis.

5283

The manager of the merchandising department of the Union Electric Light & Power Company, therefore, visited Milwaukee early in 1919 and made a complete survey of the merchandising operations of the Milwaukee Company.

The results of this investigation included the recommendation that the merchandising quarters of the Milwaukee Company be rebuilt at an initial cost of approximately $50,000.00 and that a comprehensive program be adopted for the merchandising of electrical appliances and portable lamps.

Previous to this survey, the entire merchandising volume of the Milwaukee company had been of the magnitude of

$330,000 a year. The management of the Milwaukee company decided to adopt the recommendations of the survey and arranged with the management of the Union Electric Light & Power Company for the merchandising manager of the latter

—2,305—

company to assume direct supervision of the reconstruction work in Milwaukee and the establishment of the enlarged merchandising program.

Mr. Michel spent one-third of his time in Milwaukee and
5285 carried on the supervisory functions there in addition to his work with the Union Electric Light & Power Company.

The St. Louis merchandising manager retained supervision of the Milwaukee merchandising operations until nearly the middle of 1924. By that time the merchandising volume of the Milwaukee company for electrical appliances and portable lamps alone had been increased over $800,000.00 a year and the total merchandising volume had been increased over $1,200,000.00. The merchandising profit of the Milwaukee company had been increased from approximately $30,000.00 a year to over $100,000.00 a year. In addition
5286 to this, the improved merchandising facilities and methods of the Milwaukee company greatly stimulated such merchandising by electrical dealers in the Milwaukee area. Thus a period of broad merchandising activity of electrical appliances, lamps and other types of electrical equipment was started in Milwaukee which has constantly expanded and continued throughout the years up to the present time.

This merchandising program has been one of the largest contributing factors in bringing about the average annual consumption of Milwaukee residential customers, an increase from 303 kilowatts in 1918 to 1060 kilowatt hours per cus-

tomer per annum for the year 1939 with corresponding reduc-

—2,306—

tion in the average residential rate to customers from 6.6 cents to 3.01 cents average in 1939. And I say that that increase is still going on during the current year.

The last figures which I saw for August were of the order of about 1116 kilowatt hours per customer average. I, personally, spent a great deal of time with Mr. Michel and can say from my own experience that we received great value from his merchandising ability. 5288

Mr. Michel has made a great showing in St. Louis and we were glad that we were a subsidiary so that the inconvenience that went along with losing him at St. Louis could be overlooked and he be made available to us.

Q. In these cases, do the other subsidiaries of The North American Company place themselves at your disposal? A. They place themselves entirely at our disposal as we do with other men that come to us from other subsidiaries because we know that it is desired that there be this exchange of more or less confidential information and experiences.

Such general interchange of intimate information and 5289 special work done on inquiries could exist only within a group bound closely together by common stock ownership. We could not ask such information or help from others nor would we give it to others.

An example of intimate information and information which we have recently received is the case of an inquiry

—2,307—

I made of Mr. Shea, the president of The North American Company not long ago, when we were buying a new 80,000

5290 kilowatt turbine. I wanted to check from all possible sources what some other current prices were for turbines.

Mr. Shea gave the inquiry to Mr. Moody, assistant to the president, and he personally got in contact with Mr. Neal at Washington and with the Cleveland company—I think that was all. The result was, however, that we secured, very promptly, some intimate information that dealt with what had been paid for turbines of the same general characteristics as those that we were about to buy and considerably for-
5291 tified us in willingness to accept the final price that we got on the turbine. As a matter of fact, the information that we received was helpful in actually gaining a reduction in price.

Q. Could you give us an example of special work which your companies have done on the inquiry or affairs of another North American Company subsidiary? A. At the request of Mr. Edwin Gruhl——

Q. (Interposing) Who was he? A. (Continuing) ——who was president of The North American Company until his death in the early part of the last decade—my recollection is that his request came in 1931—certain studies were made
5292 by our operating research bureau with respect to the Baltimore tie-line and preliminary report was made dated January 2, 1932.

Evidently, Mr. Gruhl wished to get the views of our company with respect to the facts that he was able to transmit to us. Subsequently, North American Company furnished more factual background and there was a further report from Milwaukee dated March 15, 1932.

This last report was at the request of Mr. Doolittle to Mr. Way. I do not claim that Milwaukee laid out the final

program, but I do claim that we were asked early in the game to make a report and I am certain that we wouldn't have been asked if it hadn't been for at least one party to the negotiations, which was an affiliate, and we would have been disinclined to make such a report if there had not been a community of interest.

Q. I don't believe that you have identified the Baltimore tie-line. You meant by that the line connecting Baltimore to what other company? A. Potomac Company.

Q. Of what city? A. Washington. 5294

Q. Have you furnished personnel to other system companies? A. We have furnished much personnel to other system companies. One example is Mr. Harvey Steinhoff, head draftsman of the mechanical division of Wisconsin Electric Power Company. He was transferred to The North American Light & Power Company group and became the

head mechanical engineer for the design of stations at Jefferson City, Missouri, Des Moines, Iowa, and many other locations.

Mr. Steinhoff was able to carry to those companies the 5295 long training and experience at Milwaukee, with resultant benefit to the associated companies.

Under no circumstances—and I say this rather strongly because we have had to plug the gap left by Mr. Steinhoff over the several years he has been gone—under no circumstances would the company have permitted Mr. Steinhoff to leave for work with non-associated companies, assuming that his services could be retained.

Q. Do you have any element of competition with the other North American subsidiaries? A. We are always competing

5296 with the other North American subsidiaries in costs and efficiency. We are keenly aware of this competition and it puts us on our mettle.

As a practical matter, we have no such feeling with respect to outside companies, and it is due to the close system relationship. I mentioned a few minutes ago about the St. Louis company paying a return visit to Milwaukee to see how our billing costs were so low and when Mr. LaPorte told me the result of the visit and that he thought the boys were
5297 going to catch up, I said to LaPorte, "Are they actually going to catch up with you?" and he looked at me and winked and said, "Leave it to me."

—2,310—

Common ownership or financial interest is the vital bond. If we did not have such committee work and general interchange of information with other North American subsidiaries and the family competition with them, important operating results would disappear.

As a practical matter, such work would not be kept up if the holding company relation were severed. This is shown
5298 by the fact that, however friendly we may be with other independent companies, we have no such activities with other independent companies.

Here is the Milwaukee Gas Light Company right in our own home town. We have no such relations with the Milwaukee Gas Light Company. True, it is in another business, but one would assume that there would be lots of problems that would come.

Q. You are in the gas business, as a matter of fact? A. We are in Racine.

5299

We believe we are doing a good job, but that we can always learn from others. There is an inherent danger of stagnation, particularly in a business such as ours, if we stay by ourselves. This constant contact with other North American subsidiaries is what we need to keep us on our toes.

The Examiner: Let us have a little recess.

(Whereupon a short recess was taken.)

By Mr. Browning:

5300

Q. Now, will you summarize for us the relations of your

—2,311—

company with The North American Company? A. As shown by the testimony here, our staff is mostly local, consisting of individuals whose life background and education have all been local.

For example, you have noted the large number of our employees who have been referred to as having their education at the University of Wisconsin. As a result, our companies have a strong local flavor and we are distinctly part of the local community.

5301

We do all things locally that need doing locally. In the last analysis, our companies are operated by their boards of directors or, as in the case of Wisconsin Electric Power Company, by its executive committee, which again are local in character. They actually make the decisions and operate the businesses.

At the same time, we are now and have long been in constant talks and consultation with the executives of The North American Company. Officers of The North American Company have spent many months in Milwaukee.

For example, the reference to Messrs. Gruhl and Doolittle. There was a time when Mr. Gruhl was assistant to the president and later, before his death, he spent a great deal of time in Milwaukee working with our conditions.

Our officers have gone to New York for conferences on an average of more than once a month. We, ourselves, have furnished or provided the training ground for various members of the North American staff. For example, Messrs. Gruhl,

—2,312—

5303 Doolittle and recently Mr. R. E. Moody, assistant to the president. We were extremely sorry to lose Mr. Moody. He was the top operating executive of Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company in the position of executive vice president, but he had this opportunity and we were glad to see him get it.

Thus, North American staff has an intimate background against which they can discuss our problems.

These conferences with North American Company are of great value to us because, in the last analysis, everyone works for someone else and is responsible to someone else. We work

5304 for our stockholders, we want their views, and to share the responsibility of various decisions with them. This would be impossible with widely scattered stockholders with small stockholdings but it is possible with The North American Company. They make very real contributions to our management because of their knowledge of other comparable utility properties, and this, combined with their intimate knowledge of our properties, enables them to give us the benefit of broader experience and knowledge and they have a more detached and objective viewpoint because they are further away from a particular problem and can see more clearly the

relative importance of the various factors entering into the decision.

I have noted that on a number of occasions, when we go

—2,313—

down there with something, we are all hepped up over some particular phase of it that to them doesn't seem important at all and when, having the thing reviewed in a broader sense by a number of our associates there, we, too, see that perhaps we have gone off on the wrong foot.

Thus, North American Company represents to us real 5306
friends and counselors and a staff to lean on. We know that we can also go to them for help and assistance. The value of the association can not be measured in dollars but is of tremendous value.

To take one example, Edwin Gruhl's insistence in 1932, that we issue $5,000,000 more of bonds than we had contemplated issuing. I remember that situation very well and with my more limited viewpoint from the financial field, I talked with Mr. Way about why borrow more money than it looks as if we actually needed to refinance the outstanding bond issue and some immediate needs, but Gruhl, in his 5307
broader vision—and he was a man of great vision and initiative—saw that there were some times ahead that would make it very convenient to have money in times of depression.

This money actually gave us the funds to go through the depression and, in my opinion, literally meant thousands of dollars, in fact, hundreds of thousands of dollars, to us in savings on account of the lower price at which we could build the Port Washington plant through the depression.

—2,314—

5308 There are many other instances where the help was just as important, although hard to measure. For example, North American Company sent Mr. Way to Milwaukee from St. Louis. I would hesitate to try to put a dollar value on Mr. Way's services down through the years to the Milwaukee company and, incidentally, The North American Company, but the testimony that I have given obviously makes it a tremendous figure.

Our financial task has been and will be especially difficult
5309 in Milwaukee because of the obsolescence which struck the street railway and interurban property. This makes our financing problems particularly difficult.

In the past, The North American Company, has, itself, loaned us money or advice and carried out financing plans. We need this help in the future. For example, our present construction program, the one that we are starting with the 80,000 kilowatt unit, has been started because of needs in connection with preparedness and we can't tell you at this time exactly how the matter is going to be financed, but we have had the assistance and the encouragement of The North
5310 American Company to go ahead and make the commitments.

We can go ahead and we have done so without actually having the money, as I have stated. Thus, we have a very real need for the holding company financial aid in the future.

There is a great difference between The North American Company and the ordinary stockholder. As a practical matter, we get nothing out of an ordinary stockholder in

the way of advice. The ordinary stockholder, naturally, hasn't either the time, ability or facilities to participate actively in the affairs of our company.

 5311

It requires a stockholder like The North American Company with tremendous investment in our companies to be able to do so. I have been to stockholders' meetings in the past when one man would turn out who happened to be a stockholder of the company.

They are, naturally, not interested when things are going well. The association with The North American Company has meant a tremendous amount to us in the past, including great savings, and will mean much to us in the future.

5312

Mr. Browning: That is all.

Mr. Binford: It is about six minutes before four, at the present time. The cross examination will obviously consume more than three-quarters of an hour. I would like to suggest that we recess until 10:00 o'clock tomorrow morning.

The Examiner: Well, I think that is a reasonable request. I hear no objection to it?

Mr. Browning: I have no objection.

The Examiner: We will recess until tomorrow morning at 10:00 o'clock.

5313

(Whereupon, at 3:50 o'clock p. m., the hearing recessed until 10:00 o'clock a. m., Wednesday, October 2, 1940.) —2,316—

5314

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

5315

Hearing Room 1101,
Securities and Exchange Commission Building,
Washington, D. C.,
Wednesday, October 2, 1940.

5316

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, Attorney on behalf of the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will come to order. Before the cross examination of Mr. Van Derzee starts, I will dispose of the motion to strike which I have under advisement. I have reviewed the witness Mr. Van Derzee's qualifications as set forth in this record and, while they are notable in his sphere of operations and extend over a period of many years, I am not convinced that they have been acquired in the field of operations nor that they are of the type which render him 5318
capable to express an opinion as a witness on the matters embraced in the question to which objection was made.

Motion to strike the question and answer appearing at the top of page 2214 of the transcript is granted.

Mr. Browning: May we have an exception?

The Examiner: Yes. I am glad for you to take that. In case I am wrong, the error can be corrected.

Mr. Van Derzee: Off the record, please.

The Examiner: Yes, off the record.

(Discussion off the record.)

The Examiner: You may proceed with cross examination, 5319
Mr. Binford.

Whereupon, GOULD W. VAN DERZEE resumed the stand and testified further as follows:

—2,318—

Cross Examination by Mr. Binford:

Q. Mr. Van Derzee, in the early part of your testimony on direct examination, you stated at some length your experience in the utility field and your educational qualifications as an engineer.

I presume you have, of course, kept up your contacts with engineering subjects in general along the lines of electric public utilities during all of your active working life? A. Those are things that you absorb by experience in your every-day contacts with your associates in the company.

Q. But you endeavor, I presume, and have endeavored to keep in touch as far as feasible with all general developments in that field that might affect your own particular business, is that true? A. I endeavor to keep up to date on things.
5321 I have contacts with our vice president in charge of power and at our various staff meetings, of course, we talk about developments in the industry.

Q. And you have a highly trained staff part of the duties of which, I assume, are to keep in touch with developments which might be of interest or of value to your own particular business, is that true? A. Yes, they endeavor to keep on top of the field. They usually do it by ideas which they, in the main, originate themselves.

—2,319—

Q. But you don't mean to say that they do not endeavor
5322 to keep themselves abreast of current developments by other independent companies? A. Oh, by no means. With respect to developments, I don't know they are, particularly, with respect to independent companies. They read the magazines; they go to the inter-company meetings of The North American group; they absorb information from many sources. You are not always conscious where you absorb it from.

Q. Would you say they are always on the alert to absorb, from whatever source it might come, such news of developments and advancements in the industry as might reach them? A. They always have their ears open. A recent de-

velopment in fluorescent lighting, for example, by the manufacturers, is of considerable interest to the utilities. Immediately we had caucuses about the effect of that type of development by the manufacturers on power factor of our system load. The average fluorescent lamp, for example, has a power factor of about 55 per cent inherently.

It was necessary to add capacitors. It was necessary to contact the manufacturers to see that they realized that problem. They are in the business of selling lamps. We are in the business of using them. It was an important development 5324
such as the type I indicated and our ears were open to that, so

—2,320—

we took the very necessary means of incorporating in our rules which we filed with the Commission that such lamps must have a power factor of at least 90 per cent unless they are in the form of small signs in which event, if they have a less capacity than 250 watts, they may have a power factor of 85 per cent. I think that is a very typical case of keeping our ears open to developments in the industry.

It is pretty hard unless one were wholly deaf not to have heard of that very important development. It almost ranks 5325
with the incandescent lamp.

Q. So you would not blacklist, as it were, an innovation which might have possibilities of economy of operation or other possibilities for benefiting your service, because it might have originated with, let us say, a company of the Electric Bond & Share System rather than of The North American Company System? A. We never blacklist anything. We always have our ears open. The type of development which I have just described was not originated by a

company, but by a manufacturer. Personally, I don't know of any particular underlying developments which have come from what you call independent companies. There may be some.

Q. By "independent companies," I presently mean companies not in The North American Company System. You know of no developments in the industry that have originated with any company outside of The North American System?

—2,321—

5327 A. In the field of sales I think the Commonwealth and Southern Company developed the objective rate idea, but I wouldn't use it on a bet. Our ten-for-one plan in my opinion is so far ahead of it that there is no comparison.

Q. Can you name another development outside of The North American Company system which pertains to the industry? A. The Hartford Electric Light Company has been for many years experimenting with a mercury boiler directly under the General Electric Company auspices but I don't know anybody that can use it.

Q. Why is that that no one can use it? It hasn't been
5328 perfected? A. I think it is too expensive and hasn't been perfected down through the years.

Q. Can you think of a third example of a development in the industry which originated outside of The North American System? A. My impression is—I am not certain that that development originated with the Hartford Company. The General Electric Company experimented with them on it. From my latest information they are still experimenting.

Possibly future generations may get some benefit from it. It is very hard to say whether such things as the use of very high voltages for transmission such as are used from Boulder

Dam are products of the engineers of large companies or a joint product of utility companies and the manufacturers.

—2,322—

I very distinctly find it difficult to recall epoch-making inventions of other companies.

Q. You do strive, however, to keep abreast of the possibility of such things happening, don't you? A. I think it is entirely possible that they may happen and quite likely that things come to the attention of some of our engineers that are examined and found wanting for some reason or 5330 another and not brought to me for any executive action.

Q. Then, you are unable to recall at this time any development in the art under consideration which originated outside of The North American Company System, is that true, and which is in use by your company or any of your companies? A. At the moment, they don't come readily to mind. I could, after thinking about the problem, and going through the field of generation, transmission and distribution, utilization, sales, perhaps recall more than I have. I won't say that none have ever come to my attention, but if they have, they have passed out of my immediate consciousness. 5331

Q. You don't recall ever adopting any plan that originated outside of The North American System? By "plan" I mean innovation or change for betterment of service, improvement of the industry. A. I can't tell you just where the use of alternating current in downtown districts developed, or whether our engineers were thinking about it at the

—2,323—

same time as others. That didn't impress me at the moment you asked the questions as being an outstanding develop-

5332 ment because we had used practically that same system for some little time, fully ten or fifteen years before the adoption in downtown Milwaukee.

The four-wire A. C. distribution system was used by the old Commonwealth Power Company which I recited our company absorbed many years ago. So I wouldn't say that that idea came from the outside. The man that developed it as engineer of the Commonwealth Power Company, was a man that gained his previous experience as an electrical
5333 engineer with our company.

In the field of generation, the important things of powdered fuel, high pressure steam, were practically original products with our company.

Q. Mr. Edison was never connected with your company? Mr. Thomas A. Edison was never connected with your company, was he? By "your company," in this case, I mean The North American Company System. A. Only indirectly through license agreements called "Edison Electric Company licenses" which we took out with the early General Electric Company. Mr. Edison, I think, assigned those patents to
5334 the General Electric Company and we became licensees and years ago got special discounts on account of that relationship.

—2,324—

Q. What technical journals are received by your companies? A. We take about four copies of the Electrical World, copies of Power and several other magazines which are circulated among people interested. We don't go in for these club offers of nearly all the technical journals because after a good deal of consideration of the subject, we don't believe it is worthwhile.

5335

Repeatedly the McGraw interests are after me to take ten, fifteen, twenty-five or fifty copies of something and give it to groups of engineers because in their opinion that is the only way they can keep abreast of the times.

We have enough copies so that what does happen on the outside comes to their attention.

Q. Do you personally ever visit the properties of operating public utility companies which are not in The North American group for the purpose of observing their methods or for any other reason? A. I will try to think of the last 5336
time that I visited a company not in The North American group. I think the last time was when I was in Chicago a year or so ago, working on the Committee of Judges who were judging the Forbes' Public Relations Prize for the best paper from any company on public relations.

After that meeting, I visited someone in the Commonwealth Power Company for a few minutes.

—2,325—

Q. That is the latest occasion that you recall? A. I think he showed us at that time the room which they had just refitted with new lighting. If I pass through a city for 5337
any reason and see an operating office, I go in and talk to the clerks, see what they are doing in a merchandise way, but I can't tell you where I had such contact last. I think it was when I drove by the windows of the Madison Gas & Electric Company. I stopped in there and talked to Mr. St. John, president, on an undertaking that we had jointly with the University of Wisconsin, to establish a new practice cottage for home economics students. I think that is about the last contact I had with another public utility.

5338 Q. When was that? A. That was the early part of August this year. I went out there specifically to talk to him about the practice cottage.

Q. You didn't, at that time, other than as a purely corollary matter, discuss with him the operating experiences in his plant and in his transmission and in his distribution systems? A. I asked him how he was getting along with his proposed interconnection with Wisconsin Power & Light Company and he said fairly well.

5339 Q. You knew of the proposed interconnection? A. Yes, I did.

—2,326—

Q. You keep in touch to that extent with the activities of other companies? A. Well, the reason that I came in contact with that was that we have, as stated by Mr. Schmidtman, an interconnection agreement with Wisconsin Power & Light Company, and Mr. Neff had told me that in any new agreement he made with Madison Gas & Electric Company, he expected to renew that interconnection arrangement.

Q. You stated Mr. Schmidtman's position with your
5340 group of companies. Would you mind stating it again please? A. He is with the operating research bureau, working on technical problems in a special investigating division.

Q. How long has he occupied that position? A. I can't tell you just when he became head of it but it has been for a number of years. He is under assistant operating research engineer who has other divisions under him, as I testified, and the operating research engineers who are assistants report to Mr. Seybold who is research engineer as well as vice president.

5341

Q. Of course, upon direct examination for the purpose of the record, as was reasonable, you used notes which served to refresh your recollection on numerous matters, did you not? A. I did.

(Discussion off the record.)

—2,327—

By Mr. Binford:

5342

Q. Since you have been in Washington during the course of this hearing, I presume you have visited the plants or offices of Potomac Electric Power Company, one of The North American Company subsidiaries, is that true? A. Well, the facts are that I came down here with Mrs. Van Derzee and I had taken my vacation without her earlier in the year in California. I think that answers why I haven't been able to go through plants of the Potomac Electric Power Company, much as I would have liked to, but to make up for that part, on account of the natural review of various things, which is proper so as not to unnecessarily lengthen the investigation, we asked Mr. Neal to visit us last night to try to make up for our visit and he came to our rooms.

5343

Q. Have you ever visited the plants or any of the plants of the Potomac Electric Power Company? A. No, I haven't. Until my recent visits here, I have not been in Washington but once before.

Q. You testified yesterday, I believe, that on one occasion you made a trip to Cleveland in connection with certain matters more particularly described in your testimony at that time. At that time, did you visit the plants or any of the plants of the Cleveland Electric Illuminating Company?

5344 A. My recollection of my testimony is that I did not testify that I had been to Cleveland, but I did testify that I went

—2,328—

to St. Louis to visit what was then known as the Union Electric Light & Power Company.

Q. Sorry. A. At that time I went through plants of the company.

Q. And that was in the year 1926 or '27? A. 1927.

Q. You haven't visited those plants or that company since
5345 that time? A. That is right.

Q. Have you ever visited the plants or any of the plants of the Cleveland Electric Illuminating Company? A. Never have.

Q. Have you ever been to Cleveland other than to pass through? A. I have never been to Cleveland to my recollection except to pass through.

Q. Have you ever visited any of the plants of any of the companies of The North American Company System other than those of the three companies with which you are at present connected? A. None except the plants of the Union
5346 Electric Light & Power Company.

Q. And that only upon the one occasion which you have previously mentioned? A. That is correct. We do not, in the first place, have as much time as we would like from the

—2,329—

operating affairs of our own company to go visiting. We have engineers and vice presidents who make it more of a point to see the properties. We have a field in Wisconsin, which is rather large, and takes considerable time to keep acquainted with it, but the mere fact that I don't go person-

5347

ally to various plants, doesn't mean that I am wholly ignorant of the practices as reflected back to me as a result of the inter-company meetings and correspondence that I have from time to time with the companies.

Q. Is your knowledge sufficient to compare the personnel and divisional and district set-up of your group of companies with that of the Cleveland Electric Illuminating Company? A. I wouldn't care to testify the way I have with respect to the organization of my own company as to the detailed organization of the other companies.

5348

I can tell you what was said to me, for example, very recently by Mr. Dornbrook, chief engineer of power plants in the regular correspondence, reporting to Mr. Post and me, things that have happened elsewhere, that did relate to the plant operations of the Cleveland Electric Illuminating Company.

Q. My question was directed to the divisional personnel set-up. A. May I continue?

Q. Yes, sir. A. And he said that the men in the plant

—2,330—

5349

organization of the Cleveland Electric Illuminating Company were able, because of the historical background of employment and things that they do, to do a great many more operations individually than our men were, who were highly specialized and also had certain restrictions as to their going from one kind of work to another on account of the unionization.

We were discussing the advantages of the Cleveland Electric Illuminating set-up from a labor standpoint—a highly confidential thing that I wouldn't care to have expressed

5350 *Gould W. Van Derzee—By Respondents—Cross*

elsewhere, but typical of the kind of things that we do get through the route of these inter-company committees.

I, of course, know that different companies have presidents, vice presidents, and the usual officers, but as to the exact duties of each of them, I have had no particular need to know their precise scope, because with respect to that, we have found a method, we think, that operates well with us. We are always willing to learn and do take advantage of information that comes, such as this piece that I recently
5351 mentioned through Mr. Dornbrook we are going back to our unions to see if there is some way, when a man changes work from one classification to another, that he can do it in a more convenient way than having charged so many cents per hour for five hours on this job and a different rate with the remaining hours on another job.

—2,331—

Q. Despite the fact that you have never personally been to Cleveland, as I understand it, you know, of your own general knowledge, that the area served by Cleveland Electric Illuminating Company is far different, in the character of
5352 its customers, than the area served by your group of companies, in that Cleveland is a highly industrial area, whereas the areas, speaking generally, served by your three companies, represent to a large extent residential and rural customers? A. Well, I don't know, as a fact, the inference that you make that our territory, as a whole, is largely residential and rural.

I do know that what we call the service area for the group of three companies, is probably a larger area than served by Cleveland Electric Illuminating Company, but that, with re-

spect to the territory of Wisconsin Electric Power Company, we have a very highly industrialized area—the greater Milwaukee district, which has many of the characteristics of the area served by Cleveland Electric Illuminating Company.

We have a large steel industry; we have breweries. In spite of the fact that Milwaukee has such a reputation in that respect, the manufactur of beer has never been first in the total output; it has always been exceeded by steel.

We also have a very substantial textile industry, food processing, and altogether, at the peak of industrial activity 5354

in the greater Milwaukee area, the output of products was estimated, by the Association of Commerce, at nearly a billion dollars.

Now, you can't get a billion dollars worth of products output in a substantially residential and rural area. It is true that we have had a very remarkable development of rural customers, but that has come about because we have taken the bull by the horns and run lines up and down practically every highway of Wisconsin Gas & Electric Company, and quite extensively, but not to the same extent, in the rural 5355 areas of Wisconsin Michigan Power Company.

Incidentally, we probably have more rural customers than the others, on that account.

Perhaps they are not as fully developed, from the standpoint of lines, as we are, and if they were they would have more rural customers by comparison.

I would say generally, though, in answer to your question, that we have a problem that is quite similar to Cleveland in the greater Milwaukee area.

5356 We are not as large as Cleveland, but we are affected because of the ups and downs of industrial power in somewhat the same way.

How do I know that? Because I have weekly before me, sent by The North American Company, the relationships of output that I have testified to.

—2,333—

Q. Are you familiar with the distribution and the transmission systems of the Potomac Electric Power Company?

5357 A. I have never had occasion personally to study those systems.

I have no doubt that the member on our electrical committee of the inter-companies, and Mr. Post, vice president in charge of power, are probably quite familiar with the details of it.

I have no particular occasion to be concerned with the precise size of pole tags, for example, although, in taking a walk behind the hotel yesterday, I did examine specifically a pole tag of Potomac Electric Power Company. It is much larger than ours. The figures are raised considerably more.

5358 I looked up at the pole and observed the type of construction, how they guy it, and there was nothing particular in that observation that impressed me one way or the other.

They have a type of distribution system that is probably more or less common knowledge to anyone who wants to observe it.

Q. But you have never had occasion to observe it? A. I wasn't informed that it was particularly unique. I think they have more underground than we have. I have observed the slot in between the rails of the transportation system, and that is an underground method of distribution of railway

energy that we don't have to have in Milwaukee—wouldn't

—2,334—

have it if we could.

Q. You weren't present during any of the testimony in this case which related specifically to the Potomac Electric Power Company and its subsidiaries, and its and their operations, were you? A. No, I was not.

Mr. Browning: Will you please read that last question? 5360

(Whereupon the last question, as above recorded, was read by the reporter.)

The Witness: No, I wasn't, but if I had occasion to find out something, I know, from my acquaintanceship with Mr. Neal, that all I would have to do would be to come down here and Mr. Neal would just go to great lengths to show me anything I wanted to know, and give me every detail that I needed.

The fact that I don't need those details is not an evidence of lack of interest. 5361

By Mr. Binford:

Q. Have you read that testimony, to which I referred? A. No, I have not.

Q. You were likewise not present when the testimony was given in this case, specifically relating to Cleveland Electric Illuminating Company and its operations, were you? A. No, I was not.

Q. Have you read that testimony? A. No, I haven't.

—2,335—

5362 Q. Your experience in the actual field of electric public utility operation has been confined exclusively, has it not, to the territory now served by the three companies with which you are at present connected? A. That is correct. Direct operating experience. There was one position I failed to indicate, in giving the details of my qualifications:

I worked on an underground gang, putting in an underground conduit, in Milwaukee, for a number of months, if that is of any value in indicating I know what a conduit
5363 looks like and what it feels like to be in a ditch.

Q. Have you ever had any contact with any state regulatory bodies, by which I mean bodies exercising regulatory power over electric public utilities, in any states other than Wisconsin and Michigan? A. No, I have had no direct contact with bodies regulating public utilities in any other states than Wisconsin and Michigan.

Q. You make no claim to personal knowledge, as to factors which influence the decisions of such bodies, other than in those two states? A. I lay claim to knowledge of a good many underlying principles, which those bodies must have in
5364 mind in making decisions. That is, factors relating to the basic principles of rate-making, depreciation, property ac-

counting, the basis on which securities are issued, but I have never sat in their councils nor do I know the exact mental processes that they have gone through.

With respect to the latter two comments, I can't say that even with respect to the Wisconsin Commission or the Michigan Commission.

Q. I believe you testified, in substance, that at one time the operating research bureau of Wisconsin Electric Power

Company made a study of and preliminary report concerning the interconnection of Potomac Electric Power Company with Consolidated Gas & Electric Company of Baltimore, is that correct? A. I made a statement which, I would like to add, contains my complete knowledge of the fact that reports were asked for by representatives of The North American Company, based on preliminary information that they sent, and then some subsequently expanded information, which was worked up into reports that The North American Company used in some way, concerning a tie line which I 5366
had never seen and know nothing about.

Q. Do you know who had charge of that investigation? A. No, I don't. That was eight or ten years ago. My feeling is that the normal arrangement for a report of that nature would be that Mr. Seybold would handle it himself.

—2,337—

Q. Mr. Schmidtman would have nothing to do with it? A. I can't say as to whether Mr. Schmidtman was in the field, of that particular division he heads now, at that time or not. I really don't know.

Q. What would be Mr. Schmidtman's rank in that division, if I may speak of rank in that connection? Would you 5367
consider him, possibly, the second or third highest man in the bureau? A. The organization is like this: Mr. Seybold still retains the position of research engineer. He has three assistant research engineers. Under one of them is the work of Mr. Schmidtman.

(Discussion off the record.)

Q. Will you please glance at Respondents' Exhibit No. 41, which is the organization chart of Wisconsin Electric Power Company?

5368 I call your attention to Page numbered 3 of that chart, in which, in the operating research bureau, there is shown a "special investigation division", of which Mr. E. H. Schmidtman is supervisor.

How long has that special investigation division been in existence? A. For some time, but I do not recollect how long.

Q. Would you say whether it has existed for ten years or more? A. I would say that it has not existed for ten years.

—2,338—

5369 This particular arrangement has developed in connection with the appointment of additional research engineers from time to time, and one of those was appointed within the last two or three years, and at that time I think there was a rearrangement of the specific duties.

Q. Should an investigation be made at the present time, of the type involved in your earlier consideration, of the connection between Potomac Electric Power Company and The Consolidated Gas & Electric Company of Baltimore, would such an investigation fall within the province of this special investigation division shown upon the chart, which is Re-

5370 spondents' Exhibit No. 41? A. I am inclined to think that it might, because Mr. Schmidtman, during the past three or four years, has gained a good deal of experience in connection with his statewide study of interconnections that he made.

Actually, the way in which a highly technical problem of that kind would be handled is about like this:

The research bureau would probably be assigned to the preparation and consolidation of material prepared both by the research bureau and also by the electrical engineer of the Company. In such a thing, I believe that he would also be consulted.

Q. At the time that the actual report and investigation was made upon this subject, was the position of Mr. Schmidtman in the operating research bureau such that he would

—2,339—

normally have at least known of the making of such investigation and the making of such report? A. He might have known it was in the shop. I really can't tell you whether he knew anything other than that.

Q. As a matter of course he would know that, though, would he not? A. I think he would be likely to know that 5372 there was an investigation in the shop. I didn't receive the original inquiry in this matter from the officers of The North American Company, and I have a very hazy recollection of what the flow of instructions was.

I really had no occasion to know about it or remember it but it is a fine example of the Company having put itself out, with no immediate return, just because it was, in effect, helping out a sister company.

Q. You say "the Company having put itself out". Do you consider that there was an outlay of money involved in anything of that kind? A. I don't know that there was any 5373 out of pocket expense, but I know that somebody had to spend time, and it is very likely that if the X. Y. Z. Company had asked us to do it, we would have said, "Sorry; we are too busy."

Q. You had to spend the salaries and the overhead, though, isn't that true? A. I don't think they donated their

—2,340—

services.

Q. At least it isn't usual, is it?

(No answer.)

5374 Q. As an engineer, are you familiar with developments in recent years of interconnections for the exchange of power between diversely owned electric utilities throughout the country? A. I know that there are interconnections, but I haven't charged my mind with learning about them. I am familiar with some in Wisconsin that have direct effect on our companies.

I know, for example, that Wisconsin Power & Light Company, with which we have an interchange contract, at one
5375 time, I believe, had an arrangement with some interests in Illinois, by which emergency power could flow, but I don't know the details of any outside inter-company contract.

Q. While you may not know the details of the contract, you do know that such interchange arrangements exist and are in operation, and have been so for some years, do you not? A. Well broadly speaking, I know that there are interconnections, but if you say do I know that there is an interconnection between Point X and Y? I can't say that there is such an interconnection without looking it up.

Q. You don't know the general manner in which such in-
5376 terconnections and interchange of power takes place? A.

Well, I know from our own experience the manner in which the interchange of power takes place between our own companies and between other companies in our state; whether those arrangements are the same, whether the contract is motivated by the same basic reasons, I can't tell you.

I can't tell you a single detail, much as I would like to respond to your question about the exact locations of other interconnections or the basic reasons therefor, outside of the fact that it is presumed to effect economies and advantages.

5377

Q. You don't know of any company outside of your own group, whose source of power is mainly from water power, which has an interconnection with a company or companies whose sources of power are primarily from steam? A. I don't know whether you could class Wisconsin Power & Light Company in that category or not. They have a substantial amount of water power.

They also have a substantial amount of steam. They have an interconnection with us, meaning Wisconsin Electric Power Company.

5378

But, outside of the state, I can't give you precise information on that.

I know that Pacific Gas & Electric Company has a very substantial amount of water power, and I believe that their steam plants are relatively unimportant.

With whom they are connected I can't say. I have no par-

—2,342—

ticular reason for knowing that precise type of information.

Q. Have you testified as to what proportion of the electric business done in the state of Wisconsin is done by the three electric utility operating companies in your group? A. No, I have not.

5379

Q. Could you state approximately what is? A. Generally speaking we have a phrase that may give you an idea on that, which is not exact, and that is that the North American group do approximately one half of the electric and gas business in the state of Wisconsin.

—2,343—

Q. Is that then far more than is done by any other affiliated group in Wisconsin? A. Yes. The next largest com-

5380 pany is Wisconsin Power and Light Company and then comes Wisconsin Public Service Company and Northern States Power Company. I don't recollect precisely their relationships but there is no other company or group of companies that does as large a business as is done by our group in the service area.

Q. Then, in magnitude, at least, there is no situation in Wisconsin from which you could draw any practical conclusions of benefit as to the situations in your own three
5381 companies, is that true?

Mr. Browning: May we have that question read back?

(Pending question was read back.)

The Witness: I don't think I understand the question. Can you explain what it intended to say?

Mr. Binford: Perhaps you had better read it again.

(Pending question read again.)

Mr. Browning: I suggest that the question should
5382 be rephrased.

The Examiner: Try it over again. Can't you rephrase it? I don't quite understand it.

By Mr. Binford:

Q. Let me state the question another way. From what you have said, it is apparent, is it not, that the other public

utility operations in Wisconsin, taken individually, are so much smaller than those of The North American group that you can't benefit much from their experiences in your own

5383

situation, is that true? A. Don't you mean that we can't benefit much from interchange with them because they don't have capacity of sufficient magnitude to help us out much on an interchange?

Q. No, that isn't what I meant. I won't press that question any further. If Wisconsin Michigan Power Company should be divorced in ownership from the interests that own the Wisconsin Electric Power Company, you are unable to state, I take it, from your experiences in that field, and from any source other than your own knowledge of the situation, that a satisfactory interchange of power agreement might not be worked out between those two companies? A. If Wisconsin Michigan Power Company were divorced, as you say, from any family relationship with Wisconsin Electric Power Company, and were thereby forced to dispose of its surplus hydro-electric energy to a buyer who would look at the proposal entirely from the standpoint of immediate benefits, I am certain that the arrangement for thus disposing of the hydro-electric power surplus would be considerably less satisfactory to Wisconsin Michigan Power Company operating alone——

5384

5385

Q. But it follows—pardon me. A. —than it is now.

—2,345—

You are probably not familiar with the fact that there is no other market for the large amounts of surplus hydro-electric energy that comes down from the north when the rivers run high than the power pool, so to speak, that is created by the existence of these large industries on the system of Wisconsin Electric Power Company, and that the result would be that a very substantial amount of the natural resources would go to waste.

Now, I don't mean to indicate to you that we could not have a contract with an outsider or that smaller amounts of energy might not be taken when, as and if we found it really convenient to take it. That is really what dump hydro-electric energy is but I do say very definitely and it isn't necessary for me to know at all what the XYZ Company does in Indiana, that the arrangement would not be as good, even though we could make an arrangement.

5386

Q. You base that upon your own knowledge of that particular territory and the particular relations existing between the companies? A. I base it on my own knowledge of the specific problem which is the one we are discussing. The fact is that our steam power plant engineers come to me at quite frequent intervals and tell me of the situation which is created by dumping a lot of hydro-electric energy on the company when they don't want to take it, but they take it to avoid an economic loss to the family without immediate loss, perhaps, but with some, to them, which is more than made up for at other times.

5387

—2,346—

Q. The security holders of Wisconsin Michigan Power Company are not identical with the security holders of Wisconsin Electric Power Company, are they? A. No, they are not.

5388

Q. Then what did you mean when, in answer to the last question, you spoke of the family relationship? A. I spoke of the family relationship in that the common stock of Wisconsin Michigan Power Company is wholly owned by The North American Company and most of the common stock of Wisconsin Electric Power Company is owned by The North American Company.

The fact that there are some other common stockholders at the present time makes it difficult to state that they are in all respects identical and that is the reason that I did not say that the common stockholders were identical.

Q. Then is it your thought that in dealings between two companies, despite the fact that the assets of these two companies represent the investments of distinctly different groups of people, it is perfectly proper management to think only of the interest of the whole, that is to say of the two jointly without distinction, if some person has enough common stock to achieve control of each of the two companies, whatever may be the detriment to the one company on an occasion or the detriment to the other upon another occas- 5390

—2,347—

ion? A. We don't consider that there is any detriment to any stockholder in this operation.

Q. But yet you consider—— A. We do not consider the interests of one particular stockholder as compared with another. We do consider, within each company, the interests of the corporation and when I work for my company I am considering the most effective and efficient means over the 5391 long pull to bring about the best service to the customers at most reasonable rates and I know that if we do that and work diligently that benefits will flow to stockholders of the one company and also to the other.

I happen to be an officer of each company, although I am not the head operating officer of Wisconsin Michigan Power Company. Now, in the case that we are talking about the thing that I said in connection with your question had this general intent, that if Wisconsin Michigan Power Company were wholly separate from Wisconsin Electric Power Com-

5392 pany and that company came to us like Wisconsin Power and Light Company has, and said, "We would like to make an interchange agreement", we might make an interchange agreement quite similar to that for dump power which we have now, although I think we might make some changes.

Q. In other words—— A. I am not through. The rate is 1½ mills per kilowatt hour. The point is, however, that

—2,348—

even though we might have identical arrangements in the
5393 two contracts, one where there is a family interest and the other where there is no family interest—I am not saying we would have them identical but just assuming they are—then the method of operation under those contracts is subject to very wide interpretation and latitude on the part of the Wisconsin Electric Power Company.

In the present case hydro-electric energy comes down at a time when it may not be most convenient to take it, yet it does represent an economic loss if it is not taken and if we take it our normal margin that we may have figured that we got by taking it and not burning coal is reduced
5394 and might be eliminated entirely for a short time.

Now, in the case that exists now, where there is a community of interest, we take that power and the fact that we take it does not throw any burden on the stockholders of Wisconsin Electric Power Company because the momentary loss on a few kilowatt hours, if there is any, is infinitesimal.

Take the case of Wisconsin Michigan Power Company, an independent company, calling us up when we have got only 20,000 kw. night load and saying, "We are going to dump 15,000 kw. on you if you can take it." What I mean to say is that at such times we would not be likely to inconvenience

5395

ourselves if there is inconvenience or reduce the margin of profit in the exchange, or suffer an extremely small momentary loss to be made up later by taking large quantities

—2,349—

when we can use it. It gets down to there being a family relationship that does not exist when two companies are separate and as to stockholders experiencing any particular effect from variations in the amount of value from time to time I don't think you can find it as far as Wisconsin Electric Power Company is concerned to any great extent.

5396

Q. Yet you don't think that such a result could be achieved by what is quite often spoken of as arm's length bargaining between independent parties? A. I have testified that we could go so far, and we have with Wisconsin Power and Light Company, as to make a form of agreement and such an agreement could be achieved, but I say that we would not go as far otherwise as we might in the case of companies which are divorced as we are willing to when it is in the family.

Q. As a matter of fact, don't certain other potential customers exist for the excess power of Wisconsin Michigan, such for instance, as certain subsidiaries of the Standard Gas and Electric System? A. Not for dump power, according to my understanding of the situation; they have plenty of their own.

5397

Q. Possibly not for dump power alone but if dump power were not required to be taken alone, but power other than dump power, firm power, were at times furnished, couldn't such an arrangement be perfected, possibly? A. Well, I

—2,350—

5398 can't speak for the managements of other companies. Wisconsin Public Service that you speak of evidently finds need for additional power because I read just recently that they are putting in a new steam plant addition at Green Bay. I think it must be obvious that if they could readily get that power from some other place and the character of power that is sent down to us for dump could be disposed of to them for firm power by some magic, that Wisconsin Michigan would immediately take them up on it and they would
5399 use it.

The facts are that it isn't usable in the form it comes down to us.

Q. There is no insurmountable geographical difficulty in the interconnection of Wisconsin properties with the properties of other utilities than the Wisconsin Electric Power Company, is there? A. I know of no insurmountable difficulties with respect to physical connection of the lines of one company with the other by the expenditure of certain amounts of money.

—2,351—

5400 Q. Wouldn't you go even further and say that such an interconnection would be perfectly feasible if desirable? A. The determination of a matter of that kind calls for my knowledge of the things that are going on in the mind of Wisconsin Public Service Company, and I can't predict that any more than I could what was in the minds of the Commissioners.

Q. I would restrict the question to feasible from a cost standpoint and technical standpoint. A. I have made no study of the problem. I wouldn't want to express an opinion without making a study.

5401

Q. You wouldn't want to express an absolute opinion that it was not technically and economically feasible, would you? A. I would not care to make a statement that it would be impossible to build a line from point A on the system of Wisconsin Michigan Power Company to point B on the system of the Wisconsin Public Service Company, but as to whether it would be of any value when the line was built, I am unable to say.

The Examiner: Let us have a little recess.

5402

(Whereupon a short recess was taken.)

By Mr. Binford:

Q. Mr. Van Derzee, you described at some length yesterday on direct examination, a recent meeting of one of The North American System inter-company committees, the accounting committee I believe it was. Did you, personally, attend that committee meeting? A. As I testified, I ap-

—2,352—

peared at that meeting. I was there for quite awhile. I could not stay all the time because I had a call from the 5403
office and I was back and forth, but I did this: We had three representatives there and in addition to the parts that I saw directly and the talks that I had with the men directly, I got reports on everything that went on. I am thoroughly familiar with what did go on. I attended the meeting.

Q. Your testimony yesterday was based upon notes made by you from your attendance at the meeting and from reports given to you by others from their attendance, is that true? A. That is true. I failed to state, in giving the names

of those who were there, that Mr. P. D. Preger, controller of The North American Company, was present, and Mr. Thurston, the auditor of the company was also there, and that the meeting was really under the direction of Mr. Preger.

The origination of this accounting committee idea was with Mr. Shea of The North American Company, and when I attended the meeting of operating executives of the subsidiaries several months ago in New York—I don't remember the exact date—it may have been the latter part of May or it may
5405 have been in June—he stated that such good results had come from the other two committees that he wanted to start immediately an accounting committee for the interchange of information and practices among the subsidiaries which

—2,353—

would work with the same facility and freedom of expression of thoughts and confidential information as the other committees worked.

Q. Which were the others—pardon me. A. The first meeting of the committee was then held at New York and then followed the meeting of the subcommittee which handles
5406 budget matters, which I attended at Milwaukee, as indicated in my testimony, and then followed the meeting of September 16.

Mr. Preger was there and had a good deal to do with the direction of the meeting and I am sorry I omitted to say that he and Mr. Thurston were there.

Mr. Browning: Who is Mr. Thurston?

The Witness: Mr. Thurston, I testified, was the auditor of The North American Company, and it was Mr. Thurston who was so much interested in the sub-

ject of audits which was one of the chapters for discussion.

Mr. Thurston, I think, had the original idea of creating these flow diagrams which show the passage of any accounting transaction from the originating department down to the books.

By Mr. Binford:

Q. From your observations, at the meetings of this committee, I understand it to be your opinion that the activities 5408
of the committee promise considerable benefit to the several subsidiary companies in The North American system. Is

—2,354—

that correct? A. It is my opinion that such benefits will result.

Q. What were the other committees which you mentioned as to inter-company committees within The North American Company system? A. I testified to the existence of the station advisory operating committee and the electrical committee.

Q. Have you ever attended a meeting of either one of those 5409
committees? A. No, I never have, but I have received reports from our vice president in charge of power and on various matters that have come up through those committees.

Some of my testimony——

Q. (Interposing) What was the last meeting of either one of those committees, or do you know? A. I can't tell you the exact date. Usually, Mr. Frost and Mr. Dornbrook discuss important features that come up in the meetings with me; obtaining those discussions and listening to their opin-

5410 ions as to the relative merits of things that are discussed such as I indicated in the testimony, is more or less a regular part of our business and I don't attempt to record in my mind the date I had the last discussion, but frequently Mr. Post says, "I would like to have Mr. Dornbrook go to this inter-company meeting. I don't want him to miss it. Have you anything that would interfere with his going?" Usually, I

—2,355—

say, "no that is about as important a thing as he has to at-
5411 tend."

Q. Usually, about how much time does that take? A. Well, usually, Mr. Dornbrook not only goes to the meetings but if the meeting happens to be in Cleveland or Potomac, he spends a little time looking around the property. As a rule he is gone two or three days or some such figure, or even longer, depending upon how much outside work there is in those companies.

Q. Did you state how long this September 16 meeting of the accounting committee lasted? A. From the beginning of the arrival of the individuals to the departure of the last
5412 one, I think it was about two and a half days.

Q. That was the first or the second formal meeting since the organization of the committee? A. That was the second formal meeting of the committee as a whole, but its subcommittee on budgets had met and that was rather a large meeting.

Q. When did that occur, as nearly as you can place it? A. I testified to that having occurred a couple of months ago and it met in Milwaukee and I attended it. I told you the reason why I attended it.

Q. Yes. And the organization meeting; that is to say, the first meeting of the committee, after, I understand, the

—2,356—

suggestion of Mr. Shea occurred—that was about when? A. I would say it was within a month or six weeks after the meeting of the executives of the subsidiary companies in New York.

Q. What was that date, then? A. I stated to you I didn't recollect exactly, but I think it was in the latter part of May or June. I can look it up for you if it is important. 5414

Q. So this committee has been created and these intercompany activities have been begun since the instigation of the present proceedings? A. I don't know what you mean by "the present proceedings."

Q. This case in which you are now testifying. A. Well, I couldn't say as to that. I didn't know when you began.

Mr. Browning: I suggest that the record will show that.

Mr. Binford: I acquiesce.

By Mr. Binford: 5415

Q. So far as you know, since the creation of the present committee, the same problems which it was designed to aid have existed, have they not? A. Some of the problems that I mentioned that were discussed at the meeting were current problems. For example, the question of how does the selective service act affect accounting matters. I think that also a gradual consciousness of the need for further perfection

—2,357—

in auditing work as well as in all other work has been there.

5416 We had auditing work sometime ago. Price, Waterhouse & Company has indicated to us ways and means from time to time in which it could be effected. We have tried to follow those suggestions. We have made real progress in that type of work, but now comes a new face into the picture in the form of Mr. Thurston who has had a great deal of experience. He suggests that we ought to make these flow diagrams. Perhaps we have been making them unconsciously in doing auditing work because of our very intimate knowl-
5417 edge of how a transaction does flow from the source to the books, but he doesn't know that, so he wants to see.

Hence, we engage in an activity that puts on paper the thing that may be wholly in the minds of the controllers. That is one of the activities. We have, naturally, had interchange from time to time, but not on the present scale. Because of the family relationship of information between controllers, one is willing to tell the other his secrets.

The basic relationship has been the same for a number of years. The fact that no formal meeting of all the people primarily interested in these things has been called, doesn't
5418 mean that no progress has been made in that direction, or that we aren't subject to improvement by new methods.

Q. Other than for the purpose of testifying in the present

proceeding, namely, that in which you are now testifying, when was the last occasion of a visit of a representative of your company, any one of your companies, to the properties or offices of Potomac Electric Power Company? A. I can't tell you that. I don't know.

5419

Q. Do you recall any occasion when any such visit was made? A. By whom in particular? Are you referring to any particular individual?

Q. No, no particular individual; any individual connected with your company. A. I don't have in mind the exact meeting place of all the meetings of the electrical committee and the operating committee, but in connection with those, I am reasonably certain that there have been visits to all the properties.

5420

Q. But you don't know, as a matter of fact, of any occasion upon which any officer or employee of your company has visited the Potomac Electric Power Company properties or offices, do you? A. I am unable to state to you the exact dates at which the visits which have occurred in the past have occurred.

Q. Are you able to state that there ever were any such visits? A. Outside of the plan of rotating the place for the electrical and station advisory meetings, which, in the course

5421

of time, would normally take in all the properties and would result in meetings of our people with the employees of other companies, I can't tell you the date on which any other officer appeared at any particular company.

Q. The last question wasn't directed to the date; it was as to whether you can testify that there ever was any such visit at any time? A. I can only tell you my background of thought in the matter, that at sometime or other officers of our company have visited. It would be difficult for me to prove to you that I ate lunch three years ago last February, but I am reasonably certain that I did.

5422 Q. And you are likewise reasonably certain that some officer or employee of some of your companies has been in Washington at some time? A. Yes.

Mr. Hamilton: Is there any doubt on that score?

By Mr. Binford:

Q. In respect to the offices and properties of the Cleveland Electric Illuminating Company, what was the last occasion upon which any representative of your company visited such properties or offices? A. Well, I make substantially the same answer with respect to those who are on the operating committees and my answer with respect to the indefiniteness of my mind as to dates when any of our officers

5423

—2,360—

went to Cleveland is the same as with respect to Potomac Electric Power.

Q. But, other than the occasion to which you testified yesterday, can you remember any occasion, regardless of date, on which any representative of any one of your companies visited the operating properties of the Cleveland Electric Illuminating Company? A. Outside of the visit of Mr. Schmidtman, I have in mind no dates or occasions of visits of our officers to the Cleveland Electric Illuminating Company, but I don't wish to convey by that that they haven't visited the company.

5424

Responsible officers of our company are able to travel here and there without getting permission from me. It is particularly true of the president.

Q. Do you recall any occasion other than any to which you have previously testified in this proceeding, of a visit of

5425

any representative of any one of your three companies to the properties or offices of the Union Electric Company of Missouri, or any of its subsidiaries? A. With respect to the matter of recollection, my answer is the same as last given with respect to Cleveland, but if you view the matter as important, I certainly can have history reviewed and see if I can find out.

Q. But, of your present recollection, you are unable to state as to whether any such visits have taken place, or if so,

—2,361— 5426

when? A. I believe that visits of that kind have taken place and for definite reasons, but I can't tell you the time nor do I know the reasons. There are so many things go on in this business that you don't attempt to recollect things of that type over the decades.

For me to say that an officer of our company never visited any of these companies, would be ridiculous, because I am certain that it isn't so and I know that the representatives of the inter-company committees which are on the firing line in their particular problems meet a number of times a year.

Q. How many times a year? A. Wherever the meetings 5427 are held.

Q. How many times a year? A. And as to whether or not they attend all the meetings or are able to attend all of them, I can't say, but I believe that they would average four a year in attendance and——

Q. (Interposing) Mr. Van Derzee, will you please refer to Respondents' Exhibit 32, which is a blueprint map of the territory served by the three companies with which you are connected? A. Yes.

5428 Q. You will note that there is an un-crosshatched strip of territory intervening between the northernmost territory an shown as served by Wisconsin Gas & Electric Company, and the southern area centering around Appleton served by

—2,362—

Wisconsin Michigan Power Company.

Can you state what the source of electric utility service is in that area extending across Manitowoc, Calumet, Winnebago, and Waushara counties, and also south of Winne-
5429 bago County, in Fond du Lac County? A. It has been quite a long time since I have examined the agreements which exist in most cases and are filed with the Public Service Commission as to the operating territorities for distribution.

My recollection is that the area which you refer to, east of Lake Winnebago, is generally served by Wisconsin Public Service Company, and that the area to the west embraces territory in which Wisconsin Power & Light Company has distribution lines. I haven't a map of their systems before me so I can only testify from recollection.

Q. Would it be correct to say, to the best of your recol-
5430 lection, that all of the territory south of the south line of the northern area, the northern service area, shown as served by Wisconsin Michigan Power Company, and east of the southern area so served, down to the northernmost service area of Wisconsin Gas & Electric Company, is served by Wisconsin Public Service Corporation, or affiliated companies?

Mr. Hamilton: Could that question be read back again?

(Whereupon the pending question was read by the reporter.)

—2,363—

Mr. Binford: Referring, of course, to the area shown on the map, Exhibit No. 32.

(Discussion off the record.)

By Mr. Binford:

Q. May I further identify the territory indicated by my question as lying within the counties of Marinette, Menominee, Oconto, Brown, Kewaunee, Manitowoc, Calumet and Winnebago? A. That area is generally served by Wisconsin 5432
Public Service Company except insofar as there are municipal distribution systems located therein. It is largely a rural area with a few cities.

Q. Now, the remainder of the territory immediately surrounding the southern distinct area shown as served by Wisconsin Michigan Power Company, is similarly served by Wisconsin Power & Light Company, is it not? A. Wisconsin Power & Light Company generally serves along the boundary lines which abut Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company southern division on the west, and in an area in Sheboygan and a part of Fond 5433
du Lac County.

Q. In other words, the area served by Wisconsin Michigan Power Company centering upon Appleton, as shown upon the map to which we are referring, might be described as somewhat of an island service area completely surrounded by service areas of Wisconsin Public Service Corporation, might it not? A. I wouldn't describe it as an island sur-

rounded by Wisconsin Public Service Company. In fact, I wouldn't describe it as an island at all. It is a matter of

5434 *Gould W. Van Derzee—By Respondents—Cross*

fact that every company has to be abutted by some company, no matter how big it is or how small it is. There is no one company that occupies the face of the globe, so the mere fact of being surrounded does not mean anything.

(Discussion off the record.)

(Whereupon, the preceding question and answer were read.)

5435 *By Mr. Binford*:

Q. The description suggested by my last question was possibly erroneous in that on the west, the Appleton service area of Wisconsin Michigan Power Company is abutted by the service area of Wisconsin Power & Light Company, is that correct? A. Yes.

Q. But the service areas of those two companies are the only service areas surrounding this crosshatched Appleton area upon the map, Respondents' Exhibit No. 32, is that right? A. Unless the village of Shawano, which is shown in the upper northeast corner as being approximately on the

5436 boundary line constitutes another system, which is not in the service area, although I think it is classed as being in the service area.

Q. Well, eliminating municipally owned plants, the statement in my last question is substantially correct, is it

—2,365—

not? A. Yes.

Q. Now, by the service areas of what companies, and excluding municipal operations, is the combined service area of Wisconsin Electric Power Company and Wisconsin Gas

& Electric Company surrounded, except insofar as it touches upon Lake Michigan on the east? A. By Wisconsin Power & Light Company on the west and generally on the north, except that one division of Wisconsin Gas & Electric Company abuts Wisconsin Public Service Company.

Q. That is on the north and east of Lake Winnebago, is that correct? A. Your comment applies to my very last statement?

(Discussion off the record.) 5438

The Examiner: This is a good point to stop for lunch. Let's recess until 1:30 p. m.

(Whereupon, at 12:35 o'clock p. m., the hearing recessed until 1:30 o'clock p. m. the same day.)

5439

AFTERNOON SESSION

(Whereupon, at 1:30 o'clcok p. m., the hearing resumed.)

The Examiner: Let us resume.

Whereupon, GOULD W. VAN DERZEE resumed the stand and testified further as follows:

5441 *Cross Examination (Continued)*:

Q. Referring again, Mr. Van Derzee, to the map marked Respondents' Exhibit No. 32 and particularly to the cross-hatched area showing the territory served in Michigan by Wisconsin Michigan Power Company, in Schoolcraft County, it appears that there is an area served which also encroaches upon and in Delta County, by Wisconsin Michigan Power Company, which is wholly unconnected with any other portion of the service area of Wisconsin Michigan Power Company and which derives its power solely through an interconnection on the east with Cliffs Power & Light
5442 Company, is that correct? A. There is such a system as you described which receives its power from Cliffs Power & Light Company. That is the particular stretch of line previously described and which has not developed to a point at which we think it advisable to make any extension from the end of the present 66,000 volt line in the vicinity of Cornell in order to serve it.

It is a fact that there have been, in the past, negotiations with respect to additional loads in between the source of power at Cliffs Power & Light Company and the village of

Cooks, which if obtained on a proper basis, would materially alter the present picture and advance the time that the disconnection of this strip would be removed from the rest of the system.

Q. From whom was that small system purchased? A. The system shown from Cooks to Cliffs Power Company was not purchased in the form in which it is shown there now. I, personally, worked on this matter many years ago, when it was necessary to bring in an oil engine from Watersmeet and establish service in the villages of Garden and Cooks. 5444

The former is not shown on the map. My recollection is that it is further down the little peninsula shown to the southwest from Cooks.

Later, when the load began to grow on this small system, consideration was given to another source of supply because the oil engine source of power was getting to be insufficient, and negotiations were opened up with the Cliffs Power & Light Company from which the company is purchasing power at other points to see if a line could be extended through Manistique so as to connect with this small independent system. 5445

Finally, those arrangements were made. My recollection is that the City of Manistique gave the company the right to go through the city but not to serve in the city. That is the way the matter stands at the present time.

Q. When was that interconnection with Cliffs Power &

Light Company effected? A. I can't give you the date offhand.

5446 Q. Can you give me approximately the year? A. I can look it up for you, but my recollection is that it was a matter of, say, three years ago or more.

Q. At that time, you evidently considered that the most economically feasible way of serving this particular small area was by an interconnection with Cliffs' Power & Light Company. That is true, is it not? A. True as far as it goes. There are a number of rural customers along this line that would take service and the point at which it was bought
5447 from Cliffs was the cheapest as far as the company was concerned as a source of power and incidentally, as a distribution line that could take care of additional customers.

It was cheaper as an expedient than any consideration of bringing a line over from Cornell or vicinity, which was the original idea in mind when we extended that line and started the development in the district of Cooks.

Q. Is the particular area served by the connection from Cliffs Power & Light Company in Schoolcraft and Delta Counties at present on a self-sustaining or paying basis insofar as monetary returns are concerned? A. We do not
5448 have separate income accounts for each small division of our system such as this. In fact, this is not a division, it is a

very small piece of line which is a part and a very small part of a very large division.

Q. So you are unable to answer the question? A. I am unable to tell you just what an income account for Cooks would look like on the bottom line, but——

Q. (Interposing) Now, that small area in turn is divided into two service areas according to this map, is it

5449

not, with a more or less perpendicular strip of unserved territory between the segments? A. There is shown a wide open space in between the two segments of the district you are talking about. I don't know whether you are familiar with the northern peninsula of Michigan or not, but there are districts where it isn't even advisable to take out a franchise if you can get one and this may be one of them.

Q. Well, do you know whether or not that area is served with electricity by any company other than—— A. (Interposing) I can't say whether the Cliffs Company has any 5450
stray lines into that township or not or whether the Manistique Light & Power extends over the boundary line into a township and thereby obtains some rights.

Q. Manistique plant is a municipal plant, isn't it? A. No.

Q. But it is confined to the community of Manistique in general? A. In general.

—2,370—

Q. Now, other than the strip of which I have spoken, and speaking particularly of Delta and Alger counties and 5451
with territory to the north and east of the area served by the line from Cliffs Power & Light Company to Cooks, what electric service is there—that is to say, by what companies is it provided or is any provided? A. I doubt if there is very much electric service of any kind in there at the present moment. I would like to refresh my memory, however, by consulting a map of the Cliffs Power Company system if we have one.

(Discussion off the record.)

5452 A. (Continuing) I have traveled in the district but not recently. At that time it was a very sparsely settled district. I doubt if there are many electric service customers in it now.

Q. And you can't at the present time state offhand as to whether or not electric service is provided by any companies within that area? A. I can't without reference to the latest maps showing the extensions of other systems.

5453 Q. That portion of the map, Exhibit No. 32, showing the unhatched part of Marquette County is served by Cliffs Power & Light Company? A. Yes, that district is generally served by Cliffs Power & Light. There may be some municipal plants in there.

—2,371—

Generally, the source of power is Cliffs Power & Light Company.

Q. The unhatched portion of Baraga County is served by what company with electric service? A. There used to be a small company in there with a name something like Baraga
5454 County Light Company. That county is even more sparsely settled than some others. I have been over a great deal of it on foot, because a large area in there known as the Sturgeon River Basin contains some water power sites which the company has.

Mr. Browning: Which company?

The Witness: Wisconsin Michigan Power Company. There is a small company serving in Baraga. I believe it has connections with the old Houghton utility that serves in the City of Houghton.

By Mr. Binford:

Q. Now, there is one other line that serves solely through the connection with Cliffs Power & Light Company, which includes the community of Michigamme, apparently, is that correct? A. Michigamme?

Q. Michigamme. A. Yes.

Q. That is correct, is it not? A. Michigamme is the correct pronunciation.

Q. But the sole source of energy in that distribution 5456
—2,372—
system is the electricity purchased from Cliffs Power & Light Company? A. Yes.

Q. When was that acquired—that distribution system? A. That was acquired, I would say, approximately the same time that a number of these other small companies were being acquired in this district.

It is entirely disconnected from the balance of the system and we acquired the system because we expected that sooner or later the line would be connected between Sidnaw and Michigamme and that we would develop one of the water 5457
power sites in Baraga County and bring therefrom a line due south so as to inject a source of power into the middle of the line and between Bruce Crossing and Michigamme.

We also had in mind that at some later date we might extend a line from a point somewhere near the word "Cliffs Power Company," which appears near the letter "A" in the word "Michigan" in a general southerly direction so as to make a loop with the Cornell line, but those events have not yet taken place. The possibility of them is still in the

picture and we are waiting for the best moment and the proper moment when it can be done efficiently.

Q. Do you consider that that isolated line, deriving its sole source of energy from Cliffs Power & Light Company is in any sense a part of the integrated system of Wisconsin

—2,373—

Michigan Power Company? A. Why, I think so. Historically, it has such antecedents. It is a fact that it is connected with the Cliffs Power Company at that point. We
5459 are connected with the Cliffs Power Company at other points.

The Cliffs Power Company has discussed with us from time to time during the past years, the possibility that we would be interested in acquiring their electric distribution system and when the negotiations last were dropped, it was a question that they wanted more money than we wanted to pay, but it seems to me very evident, even if we never acquired the Cliffs Power Company that our original plan contemplated a feasible interconnection with these, what you would call, "tag-end systems" with the main body of the
5460 northern division of the Wisconsin Michigan Power Company.

We wouldn't have bought them if we had expected to operate them independently and in perpetuity.

Q. But you think it may become in the future economically feasible to connect these two isolated small systems with your own sources of power, do you? A. I think it may. At the moment, transmission lines to accomplish that are not justified and hence, the purchase of power from Cliffs Power continues to be expedient.

5461

Q. At the moment, such interconnection would not be economical, in other words, is that true—not economically

—2,374—

feasible? A. Well, we wouldn't postpone it until the intended time in the future when we expect it would be if it were now feasible.

Q. You wouldn't say that more logically those two disconnected distribution systems would be appropriate to the system of Cliffs Power & Light Company rather than to the system of Wisconsin Michigan Power Company? A. Well, 5462
if the Cliffs Power & Light Company were giving consideration to absorbing our company, perhaps your statement might be correct.

Q. In the absence of such consideration? A. In view of the fact that future negotiations would be the other way around, I wouldn't draw any such conclusions from your question.

Q. Well, eliminating entirely the question of future consideration as to the purchase of one company by the other, now looking purely at geographical and operating facts, 5463
wouldn't it seem rather apparent that those two distribution systems which derive their sole power from Cliffs Power & Light Company should be a part of that system, if a part of any system, rather than of a company with whose lines they have no interconnection at all? A. Well, I have had so many arguments with municipalities buying power from us along the same line that I don't think it follows that the

—2,375—

mere purchase of electricity from some other source means that that is the place where ownership ought to rest in the interests of the ultimate customer.

5464 Q. You think your company and your security holders—that is to say, the company of Wisconsin Michigan Power Company and its security holders derive benefit from the ownership of these two isolated distribution systems, then? A. Yes, I am reasonably certain that they are making more than their out-of-pocket expenses because the rate that we were willing to pay at the start for current was predicated on their paying their way to a degree.

I can't tell you just what that degree is, but it is not a
5465 burden on the rest of the system.

Q. Even though there is no present interconnection with the rest of the system and such interconnection is not presently practicable? A. No, they make some contribution in my opinion to the fixed charges on the balance of the system. The customers in Michigamme, as long as they are looked out for by local agents, aren't particularly concerned with whether the power comes from Cliffs Power & Light Company or some other place as long as they get good service and we see that they get it.

Q. Well, that would be true also, wouldn't it, if you
5466 owned some isolated distribution systems in Oklahoma or some such place as that? A. Well, I was pointing out that

you have to consider these things, what the local people think. They are not crying for a transfer of this system to some other place because they think the service will be any better.

Q. Mr. Van Derzee, I believe yesterday you testified in substance that Wisconsin and Michigan rates, or the determination thereof, were made entirely independent of securi-

ties and based only on the fair value of the property which appears at page 2,212 of the transcript of record, and further amplified that statement upon the following page of the record by a statement, in effect, that the valuation of the property for the purposes of establishing a rate base was made with no relation to securities whatsoever. You were speaking from your knowledge as to what the law requires in the states of Wisconsin and Michigan in respect to the subject matter of your remarks? A. I was speaking from my understanding of the practice that has heretofore pre- 5468
vailed as far as I know it. The usual method of determining proper rates is to examine the income accounts of the company, the revenues that are derived from the sale of the business, the expenses that are incurred and are deducted therefrom, including depreciation, so as to arrive at what is usually called net operating revenue, net operating revenue being the operating revenues minus the operating expenses.

The operating expenses must include the proper allowance for depreciation. The next step in determination of

rates is to have an inventory and appraisal of the property 5469
which is used and useful in the conduct of the utility business. Not attempting to describe the long processes by which those are made and overhead values for construction are finally determined, the Commissions do arrive at a figure which is known in general in Wisconsin as the rate base.

That rate base is so determined—and I might say it includes a reasonable amount of working capital, materials and supplies and possibly some attention is given to going

value—that rate base becomes the denominator in a fraction, the numerator of which is the net operating revenue, in the determination of the rate of return.

If the per cent return on the fair value of the property is within the limits of fair return as so considered by the Commissions, then it is not the usual practice to make any change in rates but if the rate of return is considered to be excessive, then the changes are made so as to reduce the rate of return expressed in per cent to a reasonable figure.

5471 What I meant to indicate by my testimony was that that is the method of doing it that we have worked with and no other principles have been laid down to my knowledge that is definite in the determination, finally, of rates by the Commission, but I am well aware that some consideration is now being given around the country to covering the financial requirements, based on what you have to deduct from gross

—2,378—

income for bond interest, what you have to pay for preferred stock dividends, and what is a reasonable allowance for surplus out of which adequate common dividends can be paid.

5472 But, as far as my home grounds are concerned, that is the formula that is usually used and I think, as a matter of Wisconsin law, the Commissions are required to make appraisals of properties.

Q. Your impression of Wisconsin law and your impressions of Michigan law didn't enter into your answers on direct examination at the point indicated there? A. Not consciously.

Q. You are not a lawyer? A. I am not, but I do know that within the last couple of months a gentleman who is a

customer of the company went to the Public Service Commission and said, "How long since you have made an appraisal of the property of Wisconsin Electric Power Company?" and requested that the Commission forthwith make a new appraisal so that rates could be properly determined.

Q. In the computation of value or the appraisal of property, and more particularly in the computation of the value of additions to property after appraisal has once been made, there are problems, are there not, as possibly exemplified by you in some of your testimony yesterday or the day before, 5474 as to what items may properly be regarded as additions to

capital investment as distinguished from maintenance expenditures? A. Yes, there are borderline cases. Those cases, in sum total, however, are a very small per cent. of the continuous run of capital expenditures.

Q. But those are cases which necessarily call for not only the exercise of managerial discretion in respect of your own accounting, but also for the exercise of a quasi judicial discretion by regulatory bodies in determining the factors entering into your rates, is that not true? A. They would give 5475 consideration to those facts as to whether or not the rate base that we present as being proper is in effect the proper rate base.

I desire to mention, however, that this item of $50,000.00 that I spoke of, and which seems to be unquestionably a capital expenditure, is a very small per cent. of annual expenditures of three to four million dollars, and questions like that don't pop up every day. Our capital accounts are very thoroughly audited and we have to prove them to representatives of the Commission.

5476 Q. From your extensive acquaintance with the operations, other than the internal deliberations, of the regulatory bodies in Wisconsin and Michigan, can you state approximately what the number of the personnel of the Wisconsin Public Service Commission is? A. The number has been changed

—2,380—

within the past year and a half. There was a time, according to my recollection, when there were three or four hundred employees. At the present time there are three Commis-
5477 sioners. There is a chief engineer and there is Mr. Cobert; then Mr. Morehouse was head of the reseach division and he has left. Mr. O'Leary is now the acting head of the research division.

Surrounding Mr. O'Leary's office, I would just guess that he has four or five little offices in which, perhaps, fifteen or twenty men are located, and surrounding Mr. Steinmetz' headquarters, I would say that he must have at least thirty or forty men working on various projects.

When I see these officers, I don't see the men who are in the field and I have really no occasion to find out, nor am I
5478 curious about the exact number of employees that are working for the Commission. So what I give you is just the result of my own observations.

There is also another division that has to do with transportation.

Q. Will you please refer to your testimony on direct examination in this matter which appears at page 2,125 of the transcript at which point you stated in part, "In effect, The North American Company, over the years, has been our financial backer and as a result we have been freer to devote our

major attention to other phases of the business"? Is The North American Company at the present time the guarantor

—2,381—

of any securities issued by any one of the three public utility operating companies of which you are an officer? A. I know of no such guarantee.

Q. Has it ever been such a guarantor to your knowledge? A. I do not recall at this time specific instances unless the occasion recited in connection with the 1927 financing of Wisconsin Michigan Power Company, where the parent company put up, I think it was, $5,000,000.00 or $7,000,000.00 for a short period of time pending a certain transaction, could be classed as being in effect the guarantor of certain results. That was not the term that I had in mind when referring to "backer." 5480

Q. What did you have in mind? A. I had in mind that on many occasions—for example, when Wisconsin Electric Power Company in 1920 was constructing the Lakeside Power Plant, The North American Company made advances on open account for the construction of the plant.

Q. Do you know approximately what those advances amounted to? A. They were heavy but I can't tell you just the exact amount. It is a matter of record. 5481

Q. Do you know how much interest was paid by Wisconsin Electric Power Company upon those advances, what rate of interest? A. Generally, the current going rate of interest for loans of that type.

—2,382—

Q. In that territory? A. Yes.

Q. You have an approximate idea as to what those rates of interest were at the time under consideration, haven't

5482 *Gould W. Van Derzee—By Respondents—Cross*

you? A. I think they were in the neighborhood of 6½ per cent., that being the time when coupon interest on the bonds of Wisconsin Electric Power Company were bearing 7½ per cent., and the Public Service Commission of Wisconsin allowed a rate of return considerably in excess of that.

Q. You don't consider that that was a speculative loan upon the part of The North American Company, do you? A. I think that my statements yesterday with respect to the risk that The North American Company took in going
5483 into this first installation of powdered fuel bear me out in stating that along with John Anderson and Mr. Way risking their reputations, North American Company risked its capital.

Q. You mean to say risked these advances which came ahead of the preferred stock presumably and ahead of all the minority stockholders' interests? A. These were on open account without notes. In my opinion they did not come ahead of the bonds.

Q. What was that? A. These were on open account without notes.

5484 Q. And therefore? I didn't get your last statement. A. In my opinion they did not come ahead of the bonds.

—2,383—

Q. I made no suggestion of them coming ahead of the bonds, but I did suggest that they came ahead of the preferred stockholders' interests, and, in view of that fact—which you concede to be a fact, do you not? A. Yes.

Q. (Continuing) —the risk was not one that you would call extremely hazardous, was it? A. They might not have lost the exact dollars that they advanced, but they put com-

mon stock capital into the business which might have been seriously impaired if the whole plan had not worked, and, indirectly——

Q. (Interposing) But, insofar as the advances are concerned, there was no great risk involved, was there, as distinguished from the common stock investment? A. Well, if you consider just how that money would be paid back, in the event of failure of the whole project to work, it seems to me that somewhere in the picture there is a very distinct tinge of risk in connection with the whole proceeding, not 5486 only the common stock but any money advanced to effect the ends that the common stock funds were supposed to effect.

Q. Isn't it a fact that, when The North American Company was advancing you money at that time, at approximately 6½ per cent. interest, it was able to procure funds, which the Company so advanced, by paying merely three per cent. interest to person from whom it borrowed? A. I don't

know that to be a fact.

5487

Q. So you know nothing of any intervening profit there secured by The North American Company without any necessary extension of its own funds? A. I am not aware of any profit having been taken through any such channel.

Q. I believe there was a statement yesterday, by you or by your counsel Mr. Browning, to the effect that even at the beginning of the century—this present century—the process of corporate simplification had been begun by what were termed the predecessors of your present companies. I assume by that, and, from the history of the acquisition of

5488 properties by these several companies, which you have set forth, that you meant that The North American Company interests were accomplishing simplification of corporate structure by gradual absorption, throughout the area, of independently-owned companies.

Mr. Browning: Just a moment. The statement was mine and I think that probably counsel had better inquire what I meant rather than what Mr. Van Derzee meant.

5489 Mr. Binford: I believe Mr. Van Derzee is on the stand at the present time.

By Mr. Binford:

Q. I would like to ask the witness whether such a process

—2,385—

of corporate simplification as I have just suggested wasn't the principal one being effected by The North American interests in the territory now served by your three companies around the year 1900, and from then on for a considerable period of time. A. As Mr. Browning stated, I

5490 didn't make the statement that you referred to, and I wasn't with the Company in 1900, and I have never been an employee of The North American Company.

I came with The Milwaukee Electric Railway & Light Company in 1913, when the original consolidation of 1896 was a matter of dim history.

I can't say, from my own knowledge, what was in the minds of the people that brought about the consolidation.

Q. But you have traced, have you not, in your direct testimony, the acquisition of properties, which has—for

5491

the present, at least—culminated in the three public utility operating companies with which you are now connected? A. I gave the financial history, being largely a recitation of the time when the different companies were incorporated, and when they changed from one company to another, insofar as the information was available.

I did not, to my recollection, make any comments about who caused them to be combined or why.

Q. You also identified as correct the several charts on

—2,386—

5492

that subject, which were introduced in evidence by your counsel? A. That is correct. Those were prepared as the financial history of the outstanding securities, under my direction.

Q. And, as I believe you also replied in answer to a question upon the subject, from the records of the present company? A. Yes.

Q. Are you able to state whether or not those acquisitions of property were, in each instance, made directly by the company shown as the acquirer upon the several charts introduced in evidence upon that subject, or whether there was an intermediary involved? A. No, I am not.

5493

It is conceivable that someone might have obtained an option on properties and turned it over to the succeeding company.

Q. In fact, that was quite a common practice some years back, was it not? A. My recollection is, with respect to small utility properties, that was a reputable process.

Q. My question was not whether it was reputable, but whether it was not common—that is to say, frequent. A.

5494 *Gould W. Van Derzee—By Respondents—Cross*

Judging by the exchange of properties throughout the

—2,387—

country, from one owner to another, I think the evidence speaks for itself.

Q. And speaks in the affirmative, is that it? A. Yes.

Q. And you don't know to what extent profits were realized by intermediate persons or interests, in the acquisitions of these numerous properties? A. No, I do not.

Q. Or whether such profits were realized by persons
5495 affiliated with The North American System or not? A. I have no knowledge on that subject.

Q. In the course of your dealings with the Wisconsin Commission, have you been required to—and by "you", in this particular instance, I mean the three companies of which you are an officer, or any one of them—to write down values assigned upon your books to properties acquired? A. I think a part of the testimony I gave with respect to the Commonwealth Power Company indicated that a figure of $1,400,000.00 was changed to $1,200,000.00 by the Commission in connection with its approval of a certain transaction.

5496 Perhaps the best evidence of the over-all result in that connection may be a comparison of the book values and the amount of property which, by request of the Commissions, we have worked up to be assigned to Account 105, so-called, in the Federal Power classification.

—2,388—

Q. But, of your own recollection, that is the only instance that you recall? A. If you would like to have——

Mr. Binford: (Interposing) Please read the question.

5497

(Whereupon, the pending question was read by the reporter.)

The Witness: I recall an instance in connection with the purchase of Wisconsin Public Utility Company in which the Commission required that the company amortize out of operating expenses the amount of approximately $20,000.00 a year of the purchase price for a period of years and that another relatively small amount——

5498

Mr. Binford: (Interposing) Off the record.

(Discussion off the record.)

The Examiner: Better read it. I don't think the witness had finished his answer to that.

The Witness: No, I was in the middle of my answer.

(Whereupon, the statement of the witness was read.)

The Witness: (Continuing) ——be charged to surplus. I also recollect that there was some discussion with the Commission in connection with the authorization of the purchase of the Carey Electric & Milling Company, but I do not recall what the end result was.

5499

A few minutes back, I made the statement that I thought that reclassification of property, as required by the Wisconsin Commission, and also for certain companies by the Federal Power Commission, had

given some figures which might be useful in connection with your question.

Account 104, as I recollect it, is supposed to contain such amount of the total property account as represents the excess of book cost over historical cost. Account 105 is supposed to contain the amount of any write-ups of property that have occurred.

In the case of Wisconsin Michigan Power Company, the figures which have now been determined as
5501 chargeable to Account 104, are a red figure of $320,292.66. That is a very unusual entry, as you will all recognize, to Account 104.

It means that original cost for the property was in excess of the books by $320,292.00.

The amount which has been worked out for Account 105 for Wisconsin Michigan Power Company is $273,410.84. For Wisconsin Electric Power Company, the excess of books over historical cost, chargeable to Account 104 is $452,490.61 and at the time that these figures were prepared there was——

5502

By Mr. Binford:

Q. (Interposing) Will you please give the date as of which those figures purport to reflect the data therein? A. January 1, 1938. And as of that date, the amount then segregated out of the property account of Wisconsin Electric Power Company to Account 105 was $18,544.27, which amount has subsequently been eliminated by charge to surplus so that there is no write-up on the books of Wisconsin

Electric Power Company.

The charge to Account 104 which has been worked up for Wisconsin Gas & Electric Company is $130,541.25, and there is no amount chargeable to Account 105.

These amounts, as contained in the reports prepared pursuant to orders of the Public Service Commission of Wisconsin, have not been formally approved.

I think that there is extraordinary significance to be attached to the small amount of entries to be made in Accounts 104 and 105.

Q. Of course, the accounting figures which you have given 5504
are figures as of the day indicated and do not in any way reflect what write-ups there may have been in the past that may have been eliminated in the past, do they, but only what remain unaccounted for or to be accounted for? A. Figures are as of the date for which they were asked.

Q. And for the date which you stated? A. Yes.

Q. The Wisconsin Electric Power Company now has outstanding one class of preferred stock, is that correct? A. It has outstanding 6 per cent. preferred stock issue of about 1896, which we refer to as 6 per cent. preferred capital stock. 5505

Q. Which is non-callable? A. Which is non-callable.

And an issue of 4¾ per cent. preferred stock which is callable.

Q. That is as shown by Respondents' Exhibit No. 45, in this case, which shows that of the 6 per cent. preferred on June 30, 1940, there was outstanding stock to the amount in par value of $4,450,800.00 and of the 4¾ per cent. series there was outstanding, as of the same date, stock to the

par value of $26,209,800. Approximately when was the 4¾ per cent. series preferred stock last mentioned issued and sold? A. Early this year, in the late spring, as I recollect.

Q. And it was marketed, was it not, with the aid of local Wisconsin security dealers? A. It was.

Q. And without the intervention of any New York or out-of-state dealers? By "out-of-state" I meant outside of Wisconsin or Michigan. A. The underwriters of the por-
5507 tion of the stock not exchanged were entirely Wisconsin underwriters. You understand, of course, that there was no new money that went into the company in connection with this issue of stock and that it had a decided difference from other financial transactions involving large issues of bonds.

Not only in the respect that no additional money was put into the property, but the fact that the existing outstanding preferred stock, namely, the issue of 1921 6 per cent. was widely held in the locality——

—2,392—

5508 Q. (Interposing) By the "locality"—— A. (Continuing) —and it was considered that the local underwriters were, in this particular instance, particularly well qualified to make the exchange because of their intimate knowledge and acquaintanceship with the holders of a very substantial amount of the stock to be called in.

Q. And that exchange and sale was successfully carried through by the local underwriters, was it not? A. It was.

Q. Common stock, as of the same date, is shown by the same exhibit to have been outstanding in the amount of

5509

$13,959,280.00 par value. That is correct, of course, is it not? A. Yes; 1,395,928 shares outstanding, $10.00 par value.

Q. Where is the 6 per cent. non-callable preferred stock of Wisconsin Electric Power Company principally held geographically speaking? A. That stock, as you know, is a very old stock and it has come into the hands of a good many investors who keep the investment—universities, trust funds, where it is legal that it be used—and The North American Company has an amount which I do not recollect offhand, but it is a rather substantial amount.

5510

Before the refinancing referred to, I believe, if I recol-

—2,393—

lect correctly, that there were considerably under a thousand stockholders owning this stock. There are a great many small amounts in Milwaukee.

Q. Now, in respect to Wisconsin Gas & Electric Company, the preferred stock of that company is very largely held in Wisconsin and Michigan, is it not? A. It is.

Q. Was that stock—that is to say, the presently outstanding preferred stock of that company—recently issued in replacement of pre-existing outstanding preferred stock? A. Yes, in the early part of 1939, if my memory serves me correct, the plan to refinance the preferred stocks that were callable of all three companies was considered more or less as a unit.

5511

They were all of the same type. They all involved widespread ownership by residents in the communities served by the company and in the State of Wisconsin and Michigan and, hence, approximately the same general procedure was adopted. Not only was no new money involved on refinancing

5512 here from the standpoint of getting it from the sale of stock, but you will note that the amount of outstanding preferred stock of Wisconsin Gas & Electric Company decreased in connection with getting a bank loan.

Later in the year, about in December, after fininshing Wisconsin Gas & Electric Company matters, Wisconsin Michigan Power Company preferred stock was refinanced.

—2,394—

5513 Q. In each instance—that is to say, the case of Wisconsin Gas & Electric Company, the case of Wisconsin Electric Power Company, and the case of Wisconsin Michigan Power Company—the refinancing was effected through local underwriters, is that not true? A. That is correct, and for the particular reasons stated. There was, in effect, no new money going into the business and it was a question of dealers and their salesmen who knew the clientele, talking to them personally and getting the exchange and the stock called and making sale of the new stock, as the case was.

5514 Q. Now, in respect to such unsecured promissory notes, or bank loans, as were effected in these three transactions, or any one of them, isn't it true that such loans were effected primarily through the personal efforts of Mr. Way, the president of your company? A. In the case of Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company, the amounts involved were within the capacity of the local banks to handle and the records will show that the money was obtained locally and on reasonably good rates of interest.

In the case of Wisconsin Electric Power Company, where the requirement involved, as I recollect it, about fourteen

and a half million dollars, it was necessary to effect the loan in the east.

—2,395—

This was done through a syndicate headed by the Chase National Bank. I recollect that one of the Chase National Bank men came out and very carefully examined the property. I took him around and showed him the property at that time, and in answer to your question, while I don't know of my own knowledge what the extent of negotiations on that interest rate were by any of the financial men in 5516
The North American office, I am sure that Mr. Way had something to do with it.

Q. Was a finder's fee, so-called, paid in connection with the obtaining of that loan? That is to say, was compensation paid to someone for their services in connection with the negotiation or procurement of the thirteen million plus loan? A. Well, I testified that I was not a financial expert and didn't handle these matters personally. I recollect that there was a disputed finder's fee to be paid to a financing house in the east.

5517

Q. Dillon Read & Company, would that be the house? A. That sounds like the name. And I believe that that fee was finally allowed after consideration by the S. E. C.

On that point I am not certain, nor do I know the amount of the fee at the moment.

(Discussion off the record.)

By Mr. Binford:

Q. I believe you stated as a part of your reply to the

—2,396—

5518 last question that you did not regard yourself as a financial expert? A. That is right. I might say that there are varying grades of financial experts which go all the way from a good working knowledge of what makes the financial clock tick to the specialists that go considerably further. Just where I fit in that picture, I can't tell you at the moment.

Q. Did you take part in any negotiations in New York with relation to any recent financing of any of the three
5519 companies with which you are connected? A. I attended a board meeting at New York at the time of the closing of the bond sale in the amount of $55,000,000.00 to the underwriters.

That was in 1938, sometime in October. I went there as a director to make a quorum in order to facilitate the handling of certain matters that were necessary, incident to the closing operations.

Q. That was of the company now known as Wisconsin Electric Power Company, is that correct? A. Yes.

5520 Q. Who was the principal underwriter of that $55,000,000 issue? A. Dillon Read & Company I believe was the principal underwriter.

Q. Did you participate in the selection of Dillon Read &

Company as the principal underwriter? A. No, I did not. I had nothing to do with it.

Q. Have you anything that you would care to add further in regard to any financial assistance that may have been lent to any one of your three companies by The North American Company?

5521

Mr. Browning: By that I take it counsel means add to testimony on both direct and cross?

Mr. Binford: Yes.

The Witness: I think I covered the subject generally yesterday and cited a typical example of financing in 1927 of Wisconsin Michigan Power Company, which I worked on to a certain extent at the Wisconsin and Michigan end.

I think the record would show, if it were possible to bring on to it, all the transactions that occurred of a similar nature, that it would be a very voluminous record indicating continued cooperation in financial matters.

5522

By Mr. Binford:

Q. Principal offices of The North American Company are located in New York City, are they not? A. Yes.

Q. When did you last visit those offices? A. At the meeting which I referred to of the operating executives which I think occurred in May or June of this year.

5523

Q. And previous to that, what was your latest visit to

those offices? A. I would say that I was at the offices once or twice a year on some matter or other.

Q. Did you make a special trip to New York for that purpose or was that incidental to a customary annual or semi-annual trip to that part of the country on your part? A. No. The visit in the spring was particularly for that purpose and my visits are usually for that purpose. My friends in New York complain that I came down there to

5524 go back on the next train or shortly thereafter and they never see me.

Q. I believe you testified, in substance, upon direct examination that in the absence of such competitive incentives as may be furnished by your competition with your fellow companies in The North American System, there is an inherent danger of stagnation in the operation of a business such as that conducted by the three companies with which you are connected. You believe that to be true, do 5525 you not? A. Yes, I believe that to be true. I can't name you the exact degree of inherent stagnation but it exists very definitely.

Under the stimulus of what your brothers and sisters are doing, you are put on your toes to do better yourself. I think I recited the case of the St. Louis people coming to Milwaukee recently on their return visit where they were to find out why our billing costs were less than theirs and the comment that I made to Mr. LaPorte, which doesn't

express in the record the determination, vim and the vigor 5526 with which he said, "Leave it to me," when I asked him, "Are you going to let them get ahead?"

Now, if some other company had come and looked at our billing records and some remark had been dropped about "Are they going to exceed your records," I know as well as I am sitting here that you have got no such response as that.

Q. Are you at all familiar with the Detroit Edison Company or its operations? A. To some extent. Not particularly. I recollect having visited there about 1916 to find

out, in connection with a trip I was making, what they were doing to ration power. That was in a time of power shortage.

I have seen, but I wouldn't say that I know Mr. Dow very intimately. I met Mr. Savage, Mr. Marshall, Mr. Snow.

Q. These gentlemen you have mentioned are or were officials of the Detroit-Edison Company? A. I can't say as to whether Mr. Snow is an official but Mr. Dow was the president. I don't know what position he occupies now. Mr. Marshall is one of the top officers. I don't know what Mr. 5528
Savage's position is or whether he is still with the company.

Q. Do you feel that your knowledge of that company is sufficient for you to say whether or not you would regard it as

—2,400—

a stagnant company? A. I think my knowledge, including a certain amount of hearsay, is sufficient to say that it has a good reputation. I have never heard of it defined as a stagnant company.

Q. Does it participate, as far as you know, in the competitive endeavors which you feel are common to North American subsidiaries? A. It has membership on the—or 5529
at least is on the committee of operating engineers, intercompany station advisory committee, so-called, and I believe that it has a representative on the electrical committee.

I didn't see the representative from Detroit on the accounting committee.

Q. The accounting committee is the one recently created, is it not? A. Yes. I would like to add that there is a certain degree of financial interest on the part of The North American Company in the Detroit Edison Company which may be related to the participation on the committee.

Q. Do you feel that, possibly, the participation of that company, namely, Detroit Edison Company in these inter-company activities has aided it in escaping stagnation? A. Well, if they had their ears open, it would be very helpful to hear what goes on.

Q. Do you know the name of the principal electric public

—2,401—

utility serving the City of Chicago? A. Commonwealth Edison Company.

5531 Q. Is that it? A. I believe that is the name of it.

Q. That company is not at present a part of any holding company system, is it? A. I have no information on that. I doubt that it is.

Q. Would you characterize that company as stagnant? A. No.

Q. Do you know what company serves principally the City of New York with electric service? A. Consolidated Edison.

Q. That company is not part of a holding company system, is it? A. I can't answer that.

Q. Do you know enough about that company to say

5532 whether or not you would consider it stagnant? A. I really know very little about it with the exception that I have heard their residence rates are not as low as some in the middle west.

Q. Do you know what electric public utility company serves the City of Boston? A. I believe it is the Boston Edison.

Q. That company, likewise, is not a part of any public utility holding company system, is it? A. I can't answer

—2,402—

that.

Q. Are you sufficiently familiar with the operations of that company to be able to express an opinion as to whether it is stagnant or not? A. I really have no information with respect to its degree or lack of stagnation.

Q. You do concede that it is possible for a company—a public utility company—independently owned, to be operated progressively and not to stagnate, do you not? A. I don't know any reason why, with proper circumstances, it ought not to be progressive, but I am not attempting to pass on how much more progressive it would be if it had the facili- 5534
ties of family relationships of people in the same business.

Q. Would you say, along that same line of reasoning, that the ultimate good in this direction would be accomplished by a single holding company system for all the major utility companies of the United States? A. No. Then you get into meetings of the intimate inter-company committees which become conventions and I have previously described why you can't get much out of a convention.

Q. Where would you draw the line at the size of such associations? A. My experience goes only to the size of the committees of the inter-company group of North Amer- 5535
ican Company.

I can't say what would happen with considerable enlarge-

—2,403—

ment in the size of the committee because I have no experience but I think it is true that if you attempt to add too many members, you lose some of the intimacy and close touch and ability to go through with a single subject to conclusion.

—2,404—

By Mr. Binford:

Q. Would you say then, in your opinion, the decrease in the number of companies participating in these activi-

ties would result in a loss to the remaining members, while any increase would tend to make the organization too large for efficient operation? A. I don't think you could measure it with such a fine micrometer as the word "any" and I am not prepared to testify as to the shades of difference that would result from subtracting one member or adding one member, but I would hazard a guess that if you made the Committee five times as large it would be unwieldy.

Q. But as it is, you feel it is just about a satisfactory
5537 size organization? A. I honestly feel that a great deal of good results from the present organization.

Q. Will you please turn to page 2210 of the transcript of testimony in this case? Reflecting your testimony of day before yesterday, the page in question shows the question:

"Well, do you have paper profits between your companies?"

And your answer:

"We have no paper profits."

Did you mean to assert that there are no profits realized, for example, by Wisconsin Electric Power Company in the
5538 sale of electricity to the subsidiary Traction Company? A.

It may be that we did not have a meeting of minds on what paper profits are. In our business we talk about a rate of return and when we get a rate of return we don't assume we have made any profit. If we have earnings in excess of rates of return, in our office at least, we begin to think that some profit has been made, that is in excess of reasonable rates of return. I didn't intend to indicate that there was not some

5539

return on the investment of Wisconsin Electric Power Company devoted to serving the electrical needs of the Transport Company. That was not in my mind.

I had the also perhaps incorrect understanding that this was in some way associated with, not what might be termed "watered stock", but some iniquitous practice of injecting into a transaction an illegitimate profit.

Q. But there are profits realized by your individual companies within the group from dealings with one another, are there not, which you do not regard as iniquitous? A. 5540
With your definition of profits being the same as mine, namely a rate of return that is reasonable on the investment serving the other company, I will say that we do get, after operating expenses and depreciation, solely on the investment required to serve the affiliate, if that is a profit, then we make a profit.

Q. But insofar as under your system your allocation of costs is true, you endeavor to realize only what you regard

as a just and reasonable return? A. That is it, and the contract under which we render that service has been in- 5541
dividually approved by the Public Service Commission of Wisconsin. They are generally found to be on a cost basis, the cost making allowance for such return as is necessary.

Q. I believe you stated earlier during the course of this cross-examination, that you were not present at the time of the giving of the testimony relative to the operation of the Cleveland Electric Illuminating Company, nor had you read the transcript of the testimony taken at that time. That is true, is it not? A. It is.

5542 Q. You know, do you not, that the Cleveland Electric Illuminating Company does not operate transportation facilities in its territory but sells electric current to a separately owned transportation organization? A. I believe that is the arrangement.

Q. Have you any knowledge of the situation existing in any city where there is a separation of ownership of the electric transportation operations and the electric lighting and power operations? A. As to what point?

5543 Q. As to the manner in which the independently-owned organizations cooperate in carrying on their respective ser-

—2,407—

vices to the public. A. No, I have no knowledge of that kind.

Q. Then, as far as your experience is concerned, you do not have sufficient facts, do you, to be fully informed as to whether such an arrangement could be carried out in respect to the Transportation Company and the Electric Power Companies in your associated group should the Transportation Company become independently owned? A. I would like to have you read that again.

5544

(Whereupon the pending question was read.)

The Witness: What do you mean by "such arrangement"?

Q. Such as existed in Cleveland and in other cities where there is cooperation between electric power companies and electric transportation companies which are not jointly or commonly owned.

Mr. Browning: Mr. Examiner, I submit that there is nothing in this record showing any arrangement

between electric companies and transit companies except as regards Cleveland and Washington, and other than Milwaukee, and that counsel's characterization of the Cleveland situation is slightly lacking in definiteness and perhaps even accuracy.

Mr. Binford: I believe the question is still proper, whether there is anything in the record about the subject at all or not. The witness has stated, in effect, that he is not familiar with any such situation anywhere. I am merely asking him if, in view of that 5546

—2,408—

fact, he still feels that he has facts within his possession so that he is sufficiently informed to know whether or not his companies could do as companies in other cities have done where such a situation does exist.

Mr. Browning: My objection or difficulty with the question is the last part of it. It seems to assume that there is some common practice in all other cities between all transit companies and all electric companies. I not only don't know that it is the fact, I 5547 know that it is not the fact.

Mr. Binford: I disclaim any attempt to have such an assumption in the question.

Mr. Browning: Perhaps we could simplify the question a little.

The Examiner: Let's go off the record and see if you can't get that question simplified and submit it to the witness.

(Discussion off the record.)

5548

By Mr. Binford:

Q. I will try to rephrase the question. Since, as I understand it, Mr. Van Derzee, you have had no acquaintance with the relations existing between an electric power company and an electric transportation company in any city in which those two companies were not owned in common, do you feel that you are sufficiently informed to give an opinion

—2,409—

5549 as to how the situation would work out in your territory if the Electric Transportation Company were owned by someone who did not own nor control the Electric Power Companies? A. That is a difficult question to answer in one sentence. It really requires a review of the number and character of all contacts that Wisconsin Electric Power Company has with The Milwaukee Electric Railway and Transport Company, the examination of the basis of each one, on the strength of which individual analysis conclusions could be reached with respect to that one as to whether I thought if the Transport Company were separate they would

5550 get as good a deal on that particular thing as they now get, and as I have explained in detail in connection with the tie-ins between the Electric and the Railway property, but I will give you one example and I can give you a number more. That relates to the Power contract between Wisconsin Electric Power Company and The Milwaukee Electric Railway and Transport Company.

I don't know whether Mr. Schmidtman made any explanation of that contract or not, but the rate for power contained in that contract is a basic rate of .78¢ per kilowatt hour. That covers the delivery of direct current

service. That means that in the ownership of Wisconsin Electric Power Company must rest all of the power production apparatus required to deliver 600 volt service at the

—2,410—

trolley. That means that the rotary converter sub-stations must be included in the investment of Wisconsin Electric Power Company.

Those familiar with the rates for electric power would know that a rate of .78¢, with minor adjustments up or 5552
down, depending on labor and coal costs, is a reasonably low rate. I don't have the figures charged by other companies, but I heard some of them at the time this matter was being discussed with the Public Service Commission of Wisconsin; my impression is that it is below the average, and that it is probably not common practice to sell direct current service, although some may do it.

In the analysis of the component parts of the cost of power charged by Wisconsin Electric Power Company to the Transport Company is a rate of return on the investment used, which we know and the Public Service Commission 5553
knew, was below the average rate of return charged on ordinary business, but here we were, with one company doing all the business, the formation of a subsidiary to take over the transportation business and the necessity on the part of that subsidiary of having electric power at a reasonable rate.

I think I could say that if the Transport Company were owned by outside interests and they paid us off, that it would be very unlikely that we would invest in sub-station

—2,411—

5554 equipment necessary to convert alternating current into direct current and make a rate anywhere near what we have made.

The relationship between the Transport Company and the Electric Company is naturally a very close one. We want to see it succeed, not at the expense in any way of the Electric Company, but we want to get a return on our investment some day in it if we can. We want to be assured, if we can, that the bond interest will be paid.

5555 The Public Service Commission took into account all of the various aspects of the case when what they thought was a relatively low rate was finally approved.

We have just hosts of other extremely intimate contacts with that company. We operate the telephone system for them. I can't imagine another company operating a telephone system for a transport company just because it is our practice with this familiar arrangement to do things best where they can be done best. That left the telephone system with the electric company.

5556 Ordinarily an independent railway company would have to have its own dispatching telephone system. The Railway Company uses thousands of feet of duct which were all left in the Electric Company when the separation was made.

They use certain rights of way which have been retained by the Electric Company. They use buildings which are owned by the Electric Company. There is an intimate con-

tact in that way which I would question whether any independent companies would tolerate.

5557

The agreement on the rate of return for the rental of these buildings, and right-of-way and tracks which were still used, which we own, is a basic rental of about 1½ per cent., which varies with the prosperity of the Transport Company. If the Transport Company should earn 3½ per cent. on its own investment, then the return element in the rental for property used by the Transport Company which belonged to the Electric Company would be increased.

I doubt if an outside company, having received its money for its transportation property, would have any notion that 5558
it was up to it or that it would gain any benefit in codling along an operation of that type in the public interest. It would, in my opinion, say, "Well, boys, they have got to have electricity to run the cars or there is going to be no more service. If we are going to make an investment in all this special equipment for a long term of years required only for the railway, we are going to get our amortization costs added on to normal rates for power."

If the separate transportation company wanted to use the duct of the electric company and separation had been 5559
made such as ours, with the ducts all left, certainly that independent electric company would be in a fine position to make a nice trade and it would not be so concerned about getting a 1½ per cent. return so as to foster the business of the trans-

port company, because it would not be worried about getting interest on the bonds of the transport company. It would not be in the position of an owner of a wholly-owned subsidiary.

5560 *Gould W. Van Derzee—By Respondents—Cross*

I could give you examples of joint benefits, I believe, under the present arrangement which nobody would have the patience and time to work out if it was a separate electric company and a separate railway company. Why, we make out the payroll checks for the Transport Company employees because we have facilities for doing it and were doing it when the separation was made, and we do it more cheaply because we have the joint facilities, and decreased unit costs go along with increased volume.

5561 Can you imagine our making out the payroll checks for the Milwaukee Gas Light Company, or doing any one of a hundred intimate operations which they have done for us, which they would not listen to if they were separate?

I could go on about the use of our poles, the reasonable rental charges that do not impose any burden on us but give us some return.

Mr. Binford: Pardon me. Mr. Examiner, I don't like to interrupt the witness, but I believe that these interrelations between the companies were covered

5562 rather fully the other day on direct examination and I would like to have the pending question read, and I don't believe the answer has been responsive to the question.

—2,414—

The Witness: I think that the things I have said all relate to the very heart of the question, that the things that we do, and I know we do, would not be done if they were separated. That is the whole question.

5563

Mr. Binford: May I have the question read?

The Examiner: Yes.

(Whereupon a short recess was taken.)

The Examiner: Shall we proceed?

(Whereupon the pending question was read.)

Mr. Binford: I submit, Mr. Examiner, that that can be answered, yes or no.

Mr. Browning: I think the question may be confusing, but as I understand counsel, it is to the effect of whether the witness considers himself qualified by his experience.

5564

Mr. Binford: Yes, in the absence of outside experience.

The Witness: Yes, I think I am qualified to talk about what would happen if the transportation business were separated completely in Milwaukee from the electric business and there was no common owner.

By Mr. Binford:

5565

Q. Despite the fact that you have never operated a utility in a city where that situation existed? A. Yes, I think so. You don't, I believe, have to have operated a utility to break down the important contacts that would exist after separa-

tion into their component parts and to compare the benefits that are now being received with respect to those component parts with what could normally be expected in any other place, and when you analyze the situation that we have and find conditions that benefit the Transport Company that are

5566 even a strain on the imagination, such as our making out the payroll checks for the Transport Company, that is just one of a number of cases which, when they multiply as they have in our company, indicate to me that I know enough about this subject to state very flatly that it would not work if we were to separate the Transport Company and the Electric Company in Milwaukee at this time.

Q. I conclude from your general testimony, Mr. Van Derzee, that you believe that in your business the problems
5567 involved in any particular locality, such as the one served by your companies, are so peculiar to themselves that experiences of other companies in other localities is of very little value in arriving at solutions to your own problems. Is that correct? A. No, it is not quite correct. I look at it this way, that it is unlikely that a company which is dealing with another at arm's length is going to make any particular preferential rate, because it has no particular reason for it, that an independent electric company in another city is not going to do a tremendous number of intimate operations for the

5568 independent transport company and at extremely reasonable costs.

There is no particular reason for it. As I stated, the only reason for bringing out a number of specific instances where we do what I think is away out of the ordinary, is to show that in our particular case, if we had the separation, the Transport Company could not expect the same deal it gets now married to us.

I can tell you flatly, with respect to our company, that we would not do all these things that we now do and I don't

5569

know any other better source of information with respect to the Milwaukee property.

Q. The relations between your electric power companies and the electric transport companies are, however, the subject of State Commission regulations, are they not? A. They are.

Q. Do you think the rate of return and the reasonableness of the arrangements made, insofar as approval by the regulatory body is concerned, are affected by the fact of affiliation? A. Yes.

5570

Q. You would say that—— A. (Interposing) The history of the regulation of The Milwaukee Electric Railway and Light Company is a long history of what is called joint regulation. It is a matter of public records, and the Com-

mission has so stated that in the past, prior to the separation of the two services of the Company. We are more or less regulated together. They recognize the very important aspect of public convenience and necessity with respect to transportation service. They knew that we had a $1.00 pass fare system that produced very good results and that the public was just married to the $1.00 pass. Anything that would be done to disturb the $1.00 weekly pass in Milwaukee would be very serious.

5571

Now, since the companies have been separated, as of October, 1939, joint regulation has to some extent continued to go on. When the Commission sent us a notice not long ago giving the return on the electric and railway business, they put a third column in which was the joint return. On account of the history of the situation, they did not want

to disturb any more than they needed to the old policy of joint regulation.

You may know that they permit that the arrangement agreed upon by the bankers that $1,250,000 is set up as a reserve against possible losses in the transportation business after preferred dividends and 1 per cent. return on common stock of the Electric Company.

To a certain extent that is a continuation of joint return. I think that regulation in Wisconsin is keenly conscientious
5573 of the fact that practically the same problem exists, namely

—2,418—

to give Milwaukee and suburbs good cheap railway service and good cheap electric service together, as existed before the companies separated; so when I tell you that they allow these low rates of return on property devoted to the transportation business, you can understand from what I have said that there is some reason for it.

We, however, have to be a party to that low rate of return, and if you separate the properties, we don't.

5574 The Examiner: Was it 1938 or 1939 that you made the change?

The Witness: October, 1938. I think that is what I said.

By Mr. Binford:

Q. Is it not true, Mr. Van Derzee, that the laboratories of your companies test fuel for companies not in the North American system, and do other testing and reporting work for companies outside the system? A. We have a very small physical and chemical laboratory that grew up almost en-

5575

tirely for the purpose of supplying the needs of the various departments that purchase supplies. Coal is tested for the company. Various kinds of cloth and textiles are tested. Soaps that we use around the building are tested.

Incidentally, on account of the facilities being available, we have done a small amount of outside testing work. We have done some testing, as I recollect it, for the city,

—2,419—

in connection with concrete work. Whether or not we do any coal testing for anyone else, I don't at the moment have the information, but the total bottom line figure on the special account for the whole chemical and physical laboratory for the month is of the order of about two or three hundred dollars. It is a mere fly speck.

5576

Q. In testifying day before yesterday, you testified, as it appears upon page 2,189 of the transcript of record, at the top of that page, to the effect that the important observation that one could make by looking at the table there referred to, which was Exhibit No. 47 of the respondents, was that Wisconsin Gas and Electric Company "was last able to finance its requirements by the sale of bonds at a rate of 3½ per cent., a material reduction from the high of 6 per cent."

5577

I believe that that statement was possibly clarified by a question which I asked in connection with the Exhibits. You were referring there, I take it, not to any exact saving in cost of money to the company, but to coupon rates, is that correct? A. Yes.

Q. And one is not to draw the conclusion from the Exhibit nor from your testimony, that there was any saving in the actual cost of money to the company bearing any par-

ticular relation to the figures given, in view of the fact that the discount and premium are not shown? A. I was not at-

—2,420—

tempting to indicate that the saving in dollars of bond interest to service this debt immediately before the refinancing was 6 divided by 3½ times what it was after financing.

Q. Well, what did you mean when you said in the transcript at page 2,189, "But the important observation that one can make by glancing at this sheet is that the company
5579 was last able to finance its requirements by the sale of bonds at a rate of 3½ per cent., a material reduction from a high of 6 per cent."? What was the importance of that observation? A. I was commenting on the drop in the cost of bond money from the highest that the company had ever paid down to the lowest, showing the trends of money rates and the progress that the company had made, obviously, with its credit; that the company, now obviously in a good market, sell its bonds at a 3½ per cent. rate.

Q. You were not, however, intending to imply that the credit of the company had so materially improved that upon
5580 a comparable quality and market of comparable bond prices, the relationship of the improvement is reflected by the 3½ and 6 per cent. figures? A. No.

Q. You realize that there have been recent instances of public utility bond offerings absorbed at a yield of approxi-

—2,421—

mately 2.8, do you not? A. At the present time, but this was in 1936.

Q. Are you able to state, of your own knowledge, without reference to notes, approximately what the actual yield

to the purchaser, upon the initial sale of the 3½ per cent. bonds, the 3½ per cent. coupon represented? A. That was the transaction of four years ago. I think I testified that I did not handle the intricate financial arrangements that the company made. If it is a figure that you desire, I can readily procure it.

Q. Well, it is true, is it not, that the difference in the price of money, as reflected in bond prices, and in bond coupons, is an important factor in the rate at which your company or any other company can borrow money on bonds? 5582
A. Will you read that?

(Whereupon the pending question was read.)

Mr. Binford: I want to add to that; at one time as distinguished from another time.

The Witness: Well, the rate at which the company can borrow money, of course, depends upon the general level of the cost of money in the market and whatever the company is able to do in that respect is reflected by the credit, and if it gets a low rate, it is an important thing to the company. 5583

By Mr. Binford:

Q. But you don't claim for the companies any particular

credit for the bond market being high at any particular time, do you? A. I would not say that they had anything to do with the bond market being high.

Q. Now, will you please glance at the transcript of your testimony on page 2,218 of the transcript of testimony in

this case. At that point you stated that you participated in a rate case before the Public Service Commission of Michigan, "probably as far back as 1925", and that one of the things you remember particularly about that case, which seems strange at the present time, was that the Commission "thought perhaps the depreciation was a little bit low and agreed that after earning 8 per cent. on the investment we would have to put the balance in depreciation reserve until a certain figure was reached". You added to that, that
5583 "such conditions, of course, were far away and long ago."

From your experience before the Public Service Commission of Michigan, are you able to state when the change of attitude of the Commission in respect of the point at which depreciation could be taken as before or after return on the investment was made by that Commission, if it has changed its attitude? A. No, I can't tell you. As I pointed out, this was probably a peculiar incident in the history of early regulations in the State of Michigan. I am sure from what I hear now that they are undoubtedly pretty well

—2,423—

5586 lined up with the 6 per cent. idea with a number of the other commissions. I am also reasonably certain that most commissions in our immediate vicinity require adequate depreciation before any dividends are payable and before any pre-determined reasonable rate of return is allowed. I mention this merely as an historical curiosity and not as something that was intended to convey the present conceptions of anyone.

Q. The year 1925, mentioned, though, as being the probable year of the happening of that incident, is correct, is

not it? You say, "probably as far back as 1925"? A. Yes, and I did that because this was a Peninsular Power Company case and I could not have been interested in it until our interests became interested in it.

Q. Which was in 1925? A. That is my recollection.

Q. So that it might have been any time thereafter but not theretofore? A. It was very early in the operations and I think it would be at the other end of the period.

Q. At least you would be of the opinion that it was before 1935? A. I would say perhaps 10 years. 5588

Mr. Binford: Mr. Examiner, I have no further questions in cross-examination of Mr. Van Derzee at this time and I do not expect to have any further

—2,424—

such questions, but I wish to reserve the right, as in the case of other witnesses, to recall him for further cross-examination should the latter appear appropriate.

Mr. Browning: It is understood, as usual, that we do not concede that right.

5589

The Examiner: Well, have you any further examination, Mr. Browning?

Mr. Browning: No, Mr. Examiner.

The Examiner: All right, you may be excused, Mr. Van Derzee.

(Witness excused.)

Mr. Browning: We now wish to move for adjournment of this hearing until Monday morning, October 21. We have finished with this testimony in regard

5590 to the Wisconsin-Michigan group of companies and will expect to proceed with another group of companies, in all probability the Union Electric Company of Missouri and its subsidiaries. That is an extensive system, the largest group of properties in some respects that we have had yet to consider, and we will require such an adjournment for adequate preparation.

(Discussion off the record.)

5591 The Examiner: Very well, this matter is now continued until October 21, at 10:00 o'clock a. m.

(Whereupon, at 4:20 p. m., the hearing was adjourned until 10:00 o'clock a. m., Monday, October 21, 1940.)

5592

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1102-A,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Monday, October 21, 1940.

Met, pursuant to adjournment, at 10 o'clock a.m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, ARTHUR J. BUSWELL, and E. M. CALKIN, Attorneys for the Securities and Exchange Commission.

5596 *Stanley Stokes—By Respondents—Direct*

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Hamilton: Mr. Stokes.

Whereupon, STANLEY STOKES called as a witness on behalf of the Respondents, being first duly sworn, was examined and testified as follows:

Direct Examination by Mr. Hamilton:

5597 Q. Will you give your name and address to the reporter? A. My name is Stanley Stokes, address 7171 Washington Avenue, University City, Missouri.

Q. And will you state your present connection with Union Electric Company of Missouri, and its subsidiaries, and also outline your experience, your business career, with those companies? A. My present position with the Union Electric Company of Missouri, and subsidiaries of that company, is that of consulting electrical engineer.

In that capacity we have a department of engineers there who supervise the major developments in the system en-
5598 gineering. This includes planning for power plant requirements, main system changes of any kind to take care of the growth of load.

I came with this group of companies in 1912, having graduated from Missouri University. I took a five-year

—2,427—

course there, and obtained the degree of Electrical Engineer.

My first work with the company was in construction work, in which I was engaged for about a year and a half. Following that, I then was placed on some cost analysis work

5599

to determine unit costs of various types of construction, including the job which we had just completed which at that time represented the receiving substation at the St. Louis end of the Keokuk transmission lines.

That cost analysis work went on for some months, and from there I went into a short bit of work on some rate schedule preparation.

During the next six months, I was engaged on various applications, among which was the development of some studies leading toward the use of gas-house-heating for the St. Louis County Gas Company.

5600

My next operation was to handle sales engineering work for power sales. We call it the power sales division to distinguish it from the residential and smaller types of sales work.

In that work it was necessary in those days to do our own construction, on the customers' premises; in other words, to make him a proposal to change his motors or change over from steam or some other form of power, to electricity.

So I had a combination there of sales and construction work.

5601

—2,428—

In about 1917 the company (meaning this group of companies) decided to expand their operations into the adjoining counties surrounding the City of St. Louis, and St. Louis County. I was placed in charge of the new district, and built the transmission lines out to those adjacent counties, and took over operations one at a time, as the additional counties were taken on.

My title then was General Superintendent of Outlying Divisions. That work was continued for several years, until about 1925. During that period I was in complete charge of the operation and construction of those properties, which were handled as a seperate unit, not a part of the city group. During the developmental period it was difficult to do it any other way.

As we had then completely connected the various towns and counties to which I referred, I then moved back to the
5603 St. Louis district, having been located at Festus, Missouri, a town about 35 miles South of St. Louis, while that work was going on; and I was then referred to as Assistant to the Vice President, and retained that title until about 1931.

There was another assistant doing similar work, there were two of us. My work was mostly of a technical nature.

In 1931, the growth of the company had been rather rapid during the period leading up to 1929, and the engineering requirements for plant expansion and system expansion had become more or less predominant from my

5604 viewpoint, and I gradually shifted almost entirely into the engineering phase, and at that time my title was changed to Consulting Electrical Engineer—which it is today.

Q. You have been employed continuously by Union Electric Company of Missouri, and its subsidiaries, or its predecessor company, since 1912, have you? A. That is correct.

Q. And you have held no other position, other than with the Union Electric or its subsidiaries or predecessor company? A. That is right, I have had no other position. The

title itself is a little misleading because I do put in all of my time for the company, I have no outside consulting work.

Q. Are you personally familiar with the properties of Union Electric Company of Missouri and its subsidiaries? A. Yes, I am.

Q. And are you also personally familiar with the operations of those companies and the problems arising out of the operations of those companies? A. Well, to the extent that any one individual can say that he is familar with a large company of that type, I think I can say so, yes. 5606

Q. Now in order that we can be clear as to the names

and relative relationships of the companies as to which you are testifying, will you state the subsidiaries, the names of the subsidiaries of the Union Electric Company of Missouri? A. Union Electric Company of Missouri is an operating company, and at the same time has subsidiaries. The subsidiaries of the Union Electric Company of Missouri include the following companies: Union Electric Company of Illinois; Mississippi River Power Company; Iowa Union Electric Company; Cupples Station Light, Heat and Power Company; St. Charles Electric Light and Power Company; Lakeside Light & Power Company; Union Electric, Land & Development Company; St. Louis and Belleville Electric Railway Company; St. Louis and Alton Railway Company; East St. Louis and Suburban Railway Company; East St. Louis Railway Company. 5607

These two latter companies are in the process of dissolution or sale. Of those companies mentioned, there are six subsidiary electric companies. I repeat, to make this

entirely clear, the six electric companies are: Union Electric Company of Illinois; Mississippi River Power Company; Iowa Union Electric Company; Cupples Station Light, Heat and Power Company; St. Charles Electric Light and Power Company; and Lakeside Light and Power Company.

In the material which follows we refer to the Union Electric Company of Missouri and these six electric companies (seven in all), as the Union Electric Group. The other companies mentioned previously will be referred to by
5609 individual names. —2,431—

In addition to the subsidiaries which I mentioned as directly under Union Electric Company of Missouri, there is another company, Union Colliery Company, a coal company. It is a subsidiary of Union Electric Company of Illinois. In addition to these companies, the St. Louis County Gas Company is a gas company doing business in St. Louis County, and is not owned by the Union Electric Company of Missouri, but by the North American Company.

Q. And the St. Louis County Gas Company is operated, is it, in general by the same management? A. It is, it is
5610 operated just as one of the other group, by the same personnel, and very closely related to the other properties, but is separately owned.

Q. Will you state whether the name of the parent company was changed to Union Electric Company of Missouri in 1937? A. In 1937 the name was changed to the Union Electric Company of Missouri, from Union Electric Light & Power Company. It is the same company, essentially, as the previous Union Electric Light & Power Company.

Mr. Hamilton: I ask that this document be marked as Respondents' Exhibit No. 51 for identification.

5611

The Examiner: It may be so marked.

—2,432—

(The document referred to was marked "Respondents' Exhibit No. 51 for identification".)

By Mr. Hamilton:

Q. Mr. Stokes, will you state what this exhibit represents? A. This exhibit represents the system of the Union Electric Group.

5612

Q. Is the information shown confined to Electric facilities? A. It is. The system as shown on here includes an area——

Q. (Interposing) Before you specify as to that, I simply want it identified.

Will you state whether the exhibit has been prepared under your supervision? A. It has.

Q. And the facts shown as to the electric facilities of the respective companies have been taken, have they not, from the records of the respective companies? A. They have.

5613

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 51.

Mr. Buswell: No objection.

The Examiner: It is admitted in evidence under the number assigned it.

—2,433—

(Respondents' Exhibit No. 51 was received in evidence.)

5614 *Stanley Stokes—By Respondents—Direct*

By Mr. Hamilton:

Q. Now I note from the map, Exhibit 51, that no electric service is indicated for the Mississippi River Power Company. Is it correct that that company has no distribution facilities? A. That company has a certain number of large industrial customers located mostly right at or near the dam, but——

Q. (Interposing) By the "dam", do you mean Keokuk?
5615 A. The Keokuk Dam and power plant, in that immediate vicinity.

But the general service in that community, distribution to the public at large, is handled by the Iowa Union Electric Company.

Q. And is it true that such customers as take service from the Mississippi River Power Company take service at primary voltages from the transmission lines? A. They do, they take service from the Power Company at primary voltage of somewhat higher than the ordinary distribution voltage, it may be 11,000 volts to 13,000 volts, and up.

5616 Q. Now will you state very briefly what facts are shown in the exhibit? A. This exhibit portrays the system of the Union Electric Group which extends from Burlington, Iowa,

—2,434—

on the north, southward along the Mississippi River to St. Louis, and further south to Fredericktown, a distance of approximately 220 miles.

It also extends from East to West, about 150 miles. On the West it terminates at the power plant and dam of the Osage Hydroelectric Plant. At that location there is shown a small hatched area, which represents the service area of

the Lakeside Light & Power Company, a small company which supplies some local service for the benefit of that particular district.

On the east, it extends to and including certain areas in Illinois adjacent to St. Louis, including the City of East St. Louis.

The transmission lines interconnecting these areas are shown on the map. The cross-hatched portion indicates that the service there is dense, and it would be impracticable to show all of the lines in that area. 5618

Q. Now will you state at what voltages transmission lines appearing on this map are shown? A. The lines there represent merely high voltage main circuits. For example, the line from Keokuk down to St. Louis is a 110,000 volt line, and the lines shown out to the Osage plant from St. Louis are 138,000 volts.

Q. Are all lines shown above a specific voltage? A. There are no small distribution lines shown on this map, the lowest

voltage at which any is shown is 33,000 volts, and your statement is correct. 5619

Q. Now in order to interpret very briefly the legend, I note at Keokuk the letters "C-H". Will you state the meaning of that legend? A. Well, "C" as shown in the legend, represents the Mississippi River Power Company, and "H" stands for hydro, or hydro-electric. So a rectangle marked "C-H" means a hydro-electric plant owned by the Mississippi River Power Company.

Similarly, letter "A" stands for Union Electric Company of Missouri, and its subsidiaries, or the Union Electric Group.

5620 "B" stands for Union Electric Company of Illinois.

"D" stands for other subsidiaries of the group.

"S", similarly, stands for steam, corresponding to "H" for hydro.

So, for example, a plant marked "B-S" would be a plant owned by Union Electric Company of Illinois, and a steam plant.

Q. All right. Now just one further explanation, if you will. A number of figures appear on the map, such as "D-10",
5621 appearing in Lee County, Iowa. Will you state the significance of that particular legend? A. In the legend, number 10 refers to a company marked Denmark Light & Telephone Company, this being one of a number of companies, a number of utilities, which buy service from the Union Electric

Group. And "D" means that it is sold by one of the subsidiaries.

Q. Of Union Electric Company of Missouri? A. Yes. There are others in a similar situation who buy power from the group. They will be described later.

5622 Q. Now will you state the aggregate square mileage of the territory served by the Union Electric Company Group? A. The Union Electric Company Group serves a total of about 3100 square miles in actual coverage, with their own distribution system. This does not include areas in which their power flows due to sale to other utilities.

Q. And the population, if you will, of that 3100 square miles? A. Well, the population of that area is—well, as nearly as I can estimate it—there is no exact designation such as Census figures, for the 3100-mile area—but as near

5623

as I can estimate it, it is about 1 million and a half population.

Exact figures, for example, in the 1940 Census, would give St. Louis 813,748 population, and we have the population figures for other more or less important towns and communities in the area.

Q. Now in addition to the City of St. Louis, how many counties are served by the group with electric service? A. This group serves all or part of 15 counties in three States.

5624

—2,437—

Q. May I ask, before you enumerate the counties, whether the City of St. Louis proper is located in any particular county, or whether it is a separate entity? A. The City of St. Louis is a separate entity. It is peculiar in that it is a county itself, it is its own county. St. Louis County, which surrounds the City of St. Louis, does not include the City itself.

Q. Now in order to clarify the exhibit, Exhibit No. 51, will you very briefly state the counties in which electric service is furnished by the Group? A. The counties in which the Group furnishes electric service are: In Missouri,—Camden, Miller, Morgan, St. Louis (referring to St. Louis County); Franklin, Jefferson, St. Charles, St. Francois, Madison, Washington—and in those last two counties the service is only partial.

5625

In Illinois,—Madison County, St. Clair, Hancock, Henderson.

In Iowa,—Lee County.

Q. I think you gave Madison County twice. A. I did. There is a Madison County in Missouri, and a Madison

5626 *Stanley Stokes—By Respondents—Direct*

County in Illinois. We only have a very small amount of service in Madison County in Missouri.

Q. Now in this distribution territory, how many communities are served by the group? A. Well, they serve

—2,438—

directly 114 cities, towns, villages and unincorporated communities. These range from small communities to pretty large cities.

For example, I could summarize the relative size of these
5627 communities as being 22 communities of less than 250 population; between 250 and 1,000 population—47; between 1,000 and 5,000—30; between 5,000 and 10,000—6; between 10,000 and 25,000—5; and from 25,000 to 50,000 population—2; from 50,000 to 100,000—1; and over 100,000 population—1. That totals 114.

Q. And will you state very briefly the names and give the population, if you are able to, of the more important communities included in that list? A. Well, first and foremost, of course, is the City of St. Louis itself, which I previously mentioned as having a population of 813,748.

5628 Where these population figures are stated, we are using the 1940 Census when available, and where it is not available, it refers to the previous Census, 1930.

In St. Louis County, we can mention Clayton, with a population of 13,872.

Mr. Buswell: Will you state whether that is the 1940 Census figure or the 1930 Census figure?

The Witness: All right. That particular figure is a 1940 Census figure.

—2,439—

By Mr. Hamilton:

Q. Follow that procedure, if you will? A. Kirkwood, the 1940 Census is 12,087; Maplewood, 1940, 12,833; Brentwood, 1940, 4,334; Ladue, 3,976, 1940 Census.

Others in there could be mentioned, such as Berkeley, 2,577.

Now I will go a little further. In University City, which is a suburb of the City of St. Louis, and also located in St. Louis County, we have a town of 32,863, 1940 Census 5630 figure.

Webster Groves, also in the same county—18,328, 1940 Census. There are other towns, such as Wellston and Normandy, which run from 2,500 to 7,400. That illustrates the type of cities found in St. Louis County.

In Franklin County I can mention four, being all of the important towns in that county. They are: Pacific—1,666 (all four of these being 1940 Census figures); Saint Clair—1,410; Union—2,099; Washington—6,635.

May I explain that those other towns previously mentioned as Normandy and Wellston, where I did not give the 5631 exact figures, those were from the 1930 Census, but all of the larger ones I mentioned were from the 1940 Census.

Now in Jefferson County, we have Crystal City—3,416, 1940; De Soto—5,117, 1940; Festus—4,612, 1940. There are other towns there smaller, and we have not the 1940 figures

—2,440—

available.

St. Charles County has only one town of any size. That is St. Charles itself, with 10,807 population, 1940 figures.

5632 *Stanley Stokes—By Respondents—Direct*

St. Francois County, which lies to the South: Bonne Terre, 3,740, 1940; Flat River—5,403, 1940; and Elvins—2,403, 1930 Census. Elvins is mentioned because it is a rather important mining town down there.

Q. What kind of mining? A. Lead mining, what they call a variegated lead district.

Now in Illinois, Saint Clair County, it contains East Saint Louis, with a population of 75,469, 1940 figures; Washington Park—3,837, 1930 Census—and others not
5633 large enough to mention.

Madison County contains Alton—30,151, 1930 Census—later figures not yet available; Roxana, a small community of 1,139, 1930 Census, but mentioned because it contains some very large industrial concerns, such as the Shell Oil Corporation Refinery, and others.

Hancock County: Dallas City, Hamilton and Warsaw, are three communities running slightly under 2,000 population, 1930 Census.

In Iowa, Fort Madison is located in Lee County, and has
5634 a 1940 population of 14,049; and Keokuk, with a 1940 population of 15,015.

—2,441—

Q. Now all these cities which you have specifically referred to are served with electric service by the Union Electric Group, is that correct? A. They are, all that I mentioned, and many others that I did not mention.

Q. Now will you state the total number of electric customers of the Group, and indicate, if you will, the general classification in which they fall? A. The Union Electric Group had, as of May 31, 1940, 351,565 customers of all

classes. To segregate these into classes, we divide them into, first, residential—309,698. All these figures, now, are as of the same date. This residential group are being again subdivided into two divisions: first, urban and suburban group —294,998; rural—14,700. Those two figures make up the 309,698 residential customers.

Then the small light and power classification—41,377.

Large light and power—412.

Public street and highway lighting—51.

Other public authorities—8. 5636

Other utilities—15.

Municipal distribution systems—3.

Electric railways—1.

That total equals the original total of 351,565.

Q. Are you able to classify that aggregate figure which —2,442— you have given by geographic districts within the territory? A. In St. Louis and vicinity there are 339,825 customers; in Keokuk and vicinity—11,403; in Lakeside and vicinity—337.

Q. Lakeside and vicinity being the territory shown on 5637 Exhibit No. 51 as the hatched territory around Osage? A. Yes, it is out here to the left. That is simply a service rendered to a little local community surrounding the Osage Dam.

The Examiner: Those two lines that lead from Osage, are they of 138,000 volts each?

The Witness: Yes, those are two routes. On each of those routes there are two circuits. On the northern route there are two independent single-circuit lines, and on the southern route there is a double-cir-

5638 *Stanley Stokes—By Respondents—Direct*

cuit steel tower line. Yes, those are 138,000 volt transmission lines from the hydro plant to St. Louis, going, one of them, by way of Rivermines. That is explained by the fact that we have a load there of around 30,000 kilowatts from the St. Joseph Lead Company, and some condensers are located there for voltage control. Then we supply service to our own district at that point.

5639 *By Mr. Hamilton*:

Q. Now in addition to the electric service, at the cross-hatched area shown on Exhibit 51, does the company make

—2,443—

sales of electric energy to other purchasers in the general territory? A. Yes, they do. They sell to 15 neighboring utilities, and three municipal distribution systems.

Q. Now those sales are by the Group, are they? A. Information is available with respect to each company.

Q. Will you give that information? A. By reference to the exhibit, we have the Iowa Southern Utilities Company—
5640 that is No. 14 in the legend—and its point of delivery of service is at Burlington, Iowa, shown on the map at the extreme northern extremity, and marked "C-14". Is that clear?

Q. Yes, go ahead. At that point we sell to that company 22,790,600 k. w. h., or rather, sold to that company that amount in 1939, which is used in Burlington, and the surrounding territory.

Mr. Buswell: You say "we sell"?

The Witness: Union Electric Group sells.

 5641

The next company is the Wever Electric Company, and it is No. 13 on the exhibit, and makes its sale at the point marked "C-13".

By Mr. Hamilton:

Q. That indicates the sale by Mississippi River Power Company? A. Yes, they purchased only 75,080 kilowatt

—2,444—

hours in 1939.

Q. The delivery, however, was by the Mississippi River 5642
Power Company? A. The delivery in that case is by the Mississippi River Power Company.

Q. As indicated by the symbol "C"? A. By the letter "C".

The next company to be mentioned is the Denmark Light & Telephone Company. They are shown as No. 10, and delivery is made at "D-10", which is on a line there right near the name "Fort Madison". There is a little arrow that points down to it. They took 243,227 kilowatt hours in 1939.

Iowa Electric Company, No 11, purchased 2,886,990 kilo- 5643
watt hours in 1939, and it was delivered to them at the point marked "C-11", which is a delivery from the Mississippi River Power Company.

The town of West Point is a small village lying west of Fort Madison, and it purchased service for their municipal distribution system which comes out of a sub-station in Fort Madison. That was 291,570 k. w. h. in 1939.

Then Van Buren Light & Power Company, No. 8, purchased 1,022,320 k. w. h. in 1939, and can be readily seen

there as "C-8", on the exhibit, showing point of delivery. That service provides electric facilities to a large part of Lee County in the part which we do not directly serve.

—2,445—

Illinois-Iowa Power Company at Hamilton and Dallas City—that is No. 4—provides service to a territory north and east of Keokuk, toward Galesburg, Illinois, and purchased 41,748,740 k. w. h. in 1939.

Central Illinois Public Service Company, at Keokuk,
5645 Hull, Quincy and Meppen, provides service to a large area in West Central Illinois, and they purchased, as shown on the exhibit, marked No. 6 in the legend, 51,422,070 k. w. h. in 1939.

A small company known as Appanoose Light & Power Company purchased 5,560 k. w. h. in 1939. They are marked No. 12 on the exhibit, and are shown as "D-12", which indicates that they were supplied from other subsidiaries. As a matter of fact, they are supplied from the Iowa Union Electric Company.

Montebello Electric Company took 35,280 k. w. h. in 1939,
5646 and are marked No. 7 on the exhibit. They provide service to a territory in Hancock County, which is not very heavily settled, and in which we ourselves do not have the distribution.

Missouri Power & Light Company are supplied service at Keokuk and Ilasco, and provides service to a large area in Northeast Missouri.

Q. Will you state the point of delivery? A. The point of delivery is at Hull for this Ilasco delivery, and at Keokuk —no, this particular one, the Missouri Power & Light Com-

pany, the major part of that delivery is at Keokuk, and the

service is used in Northeast Missouri. The amount was 7,168,500 k. w. h. in 1939.

Now that point of delivery is about 10 miles—No. 5—out from Keokuk.

Illinois-Iowa Power Company at Cahokia, and Venice—now I have moved down to this bigger area—provides service to a large area in South Central Illinois. The service taken in 1939 amounted to 252,676,900 k. w. h. 5648

Q. Now is that figure, Mr. Stokes, exclusive of the figure which you have previously given for delivery to Illinois-Iowa Power Company? A. It is. The previous figure was for delivery at Hamilton and Dallas City, which is up near Keokuk, whereas this delivery is near St. Louis. This is indicated by the same number—4—and is shown as "B-4", right to the right of the main part of the City of St. Louis. The word "Venice" is shown on the map, and just above it are the letters "B-4", indicating the delivery to the Illinois-Iowa Power Company at that point. That is a large delivery.

East Missouri Power Company took 498,175 k. w. h. in 5649 1939, indicated by No. 18—a small sale.

Missouri Electric Power Company took 4,092,990 k. w. h. in 1939. That is indicated by No. 17, on the exhibit.

Arkansas-Missouri Power Corporation took 5,373,036 k. w. h. in 1939. That is No. 16. That point of delivery is right, not far from St. Louis. That is "A-16", sold by the

Union Electric Company of Missouri. It is almost down to Madison County.

5650 The City of Farmington, which is in that same district near this last point of delivery, took 2,496,600 k. w. h. in 1939. It is marked as No. 2, and shown just south of Rivermines, as "A-2". It was sold by the Union Electric Company of Missouri.

Western Light & Telephone Company took 587,400 k. w. h. in 1939, and that is shown as No. 15 on the map. That is a small concern that buys a little power from Lakeside, near the Lakeside area. You will find it out at the extreme west
5651 of the map. They provided service adjacent to that served by the Union Electric Group.

Q. And that point of delivery is shown on the map as "D-15", is it not? A. That is right. It comes off of the little red square indicating the hydro plant there in the middle of the Lakeside Light & Power Company hatched area.

That completes the list of electric companies and municipalities buying service.

This area which the company serves is a relatively high load density area, taken as a whole.

Q. Mr. Stokes, I think you may not have mentioned the
5652 deliveries to the City of Kirkwood appearing on Exhibit No. 51 as No. 1. Will you locate that point of delivery and give

the sales? A. It is immediately west of St. Louis, and is marked "A-1". The City of Kirkwood took 7,573,400 k. w. h. in 1939. It is a suburb of St. Louis, located a few miles west.

Also, Nauvoo Electric Light & Power Company, shown as No. 9 on the exhibit——

Q. (Interposing) Is that point of delivery near Keokuk? A. Yes, it is. I am looking for the k. w. h. It is

between Keokuk and Fort Madison, marked "C-9", and is a very small concern served by the Mississippi River Power Company at the point indicated. Nauvoo Electric Light & Power Company took 331,850 k. w. h. in 1939.

Q. I interrupted your comment on the load density in the area served. Had you finished your statement in that regard? A. Well, I could expand that thought a little bit.

The Union Electric Group would, in my opinion, be regarded as what could properly be described as a metropolitan electric company, because the majority of its property is in or adjacent to a large city. In 1939, the Union Electric Group produced a total of 2,579,520,155 k. w. h., of which 401,412,412 k. w. h. were sold to other utilities for resale, leaving 2,178,107,74? as the production for its own customers in an area with a total estimated population of about a million and a half persons. 5654

—2,449—

Q. Now those figures you have given on output are group figures, are they? A. Group figures for the Union Electric Group.

Q. And when you have spoken of generation, have you spoken of net output; in other words, your figure of two billion plus, which you last gave, is a net output figure? A. That is probably a gross output figure, that is, our records on the whole are the output from the main generating unit, and I would call that figure a gross output figure. 5655

To illustrate the comparison with the general public use in the United States, which comparison may not be of any particular moment, but for such as it is worth, the report of the Federal Power Commission indicated 128,037,-

000,000 k. w. h. for 1939, with a total population of 131,060,000, approximately. With these figures we conclude that the Union Electric Group produced about 1.7 per cent. of the electric production in the United States, and supplied it, supplied that service to about 1.15 per cent. of the population, indicating that we were somewhat above the average density of the country as a whole.

Q. Now is the greater portion of the electric load concentrated in and about the City of St. Louis? A. It is,
5657 yes. The majority of all of the load is sold in St. Louis and vicinity. The area which I would consider as the vicinity

of St. Louis has been referred to as the metropolitan district. This area, which was established by the United States Census Bureau, comprises 821½ square miles, and includes the City of St. Louis, and a major portion of its surburban territory. It is the center of a more extensive trade territory or region, which includes districts having a general radius of about 40 miles from St. Louis. These references are used by the Chamber of Commerce and others when
5658 describing the trade territory.

St. Louis City has actually lost a little population within the city limits during the past decade. The flow of population has been from the city to St. Louis County. Its population in 1930, in the 1930 Census, was 821,960, and it is now 813,748. But whereas the City has been losing, St. Louis County has gained, and has increased its population in the last 10 years by 61,114. Its present population is 272,707, compared with 211,593 ten years ago, an increase of 28.9 per cent.

5659

St. Louis has not extended its city limits in all these many years, as a good many cities have.

St. Louis and St. Louis County, both combined, account for a population of 1,086,455. If you took both together, it would indicate a 5.1 per cent. growth in the last ten years.

It, in general, is pretty well suited for industrial operations. The valley is well placed for railroad connections,

and the river furnishes water supply, and out of the district's population from the 1930 Census of 1,335,158 persons, I would take that to be a rather general figure, it is assumed that 154,000 were employed as wage earners in the factories. Those figures were obtained from the 1930 Census, but the exact area to which they apply is not completely, fully designated.

5660

We have estimated 162,555 gainfully employed workers in manufacturing and mechanical industries; 85,383 in trades—that means having divided the general industry as a whole into about 10 classifications, those are the two largest ones for the St. Louis district. Others are very much less important.

5661

Q. Now is there any one industry that predominates in the St. Louis industrial area? A. Well, St. Louis is a leader in the shoe manufacturing business and in the printing business—those are the two rather large industries. We don't forget that we make lots of beer, but I should say that the shoe business and the printing industry probably represent the major businesses. We are somewhat of a railroad center. Shall I describe the railroad or transportation facilities at this point, or shall I let them go?

5662 Q. Well, before you leave this general question of the concentration of industry in St. Louis, are you able to state any statistics as to the representation of industry in the St.

—2,452—

Louis area? A. Yes, I could give a few illustrative examples.

Before leaving the population figures entirely, I would like to mention the persons per quare mile in the metropolitan district previously referred to, as 1,544, and in the City of St. Louis, as 13,333. That is not an extremely high

5663 density.

Now with respect to the industries, St. Louis has a diversified business, it doesn't manufacture just one thing like automobiles, its load characteristics are rather typical of the nation as a whole, and if you were to divide the industrial activities of the nation into 18 divisions, which has been done in some studies, we would find a number of them represented in every one of those.

As an example, if we took one division as food and kindred products, we would find the Union Biscuit Company as representative of bread and other products; the Standard

5664 Tilton Mill Company, a large flour mill company, representing the grain products.

In textiles, the Ely-Walker Drygoods Company is a typical representative. It is a very large manufacturer of men's shirts and kindred products.

In forest products, we have a number of box companies, and a casket company represented by the St. Louis Casket Company; and the National Chair Company makes chairs. The Loy-Lange Box Company is a large maker of boxes.

—2,453—

Paper and allied products is quite an industry in St. Louis, represented by two large concerns, the Graham Paper Company, and the Orchard Paper Company.

Printing and bookbinding, and lithographing has the *Woodward-Tiernan Printing Company*, among others.

Chemicals and allied products, carbide: Midwest Carbide Corporation. That is not at St. Louis, that is at Keokuk, but I mention it here because it is one of our large customers.

5666

The National Lead Company and the Monsanto Chemical Company are good examples.

In the oil or petroleum refining business, we have the Shell Oil Company, which is one of our large customers, located at Wood River, a few miles north of St. Louis.

The rubber goods—there is a boot and shoe manufacturer, the Cupples Company, making some tires and rubber goods, and they are also a customer of ours.

And so on. We have Keokuk Steel Casting Company. That is one of the largest industrials, which was referred to a while ago as being direct customers of the Mississippi River 5667
Power Company. It is an electric furnace production.

In connection with the Carbide, they also manufacture 50 per cent. ferro-silicate which is used in a number of applications, it is used for making some kinds of bearings.

Aircraft and transportation—we have the Curtiss-Wright Corporation, manufacturing aircraft. They are undergoing

a very large expansion at this moment, to increase the capacity of their plant by a very large amount, and they

5668

are adding what is estimated to be from 8,000 to 10,000 employees.

American Smelting and Refining is a good example of a non-ferrous metal. That is a big smelter, really connected with the St. Joe Lead Company.

We have glass business on a large scale. At Alton, Illinois, we have the Owens-Illinois Glass Company, which makes bottles and glass bricks. At Crystal City, Missouri, 35 miles south of St. Louis, we have one of the main fac-

5669

tories of the Pittsburgh Plate Glass Company.

There are, in addition to those industries, which are widely diversified, some heavy industries, among which I will classify the glass companies and the St. Joe Lead Company, the largest lead company in America, which operate a smelter at Herculaneum, which is just south of St. Louis, where we have extensive service. They also have the large mines in St. Francois County, which is indicated by the word "Rivermines" on Exhibit No. 51, as being about the center of the mining district.

5670

We have building materials, packing companies, Armour Packing, and others.

So that St. Louis did not have as radical a change in load during the depression as some of the other cities where the industry was not so diversified.

—2,455—

Q. Now are there natural resources in the territory which have contributed to the industrial development of the territory? A. Yes, I suppose all territories are controlled by their natural resources in the long run. The St. Louis region has certain topography characteristics which make it what

it is. The region as a whole is valleys and uplands, it is the broad river valleys of the Mississippi, Meramec and Missouri Rivers. They flow over deep beds of alluvium, and constitute extensive flood plains which are limited by abrupt bluffs as you get to the edge of the river valleys. There is another small river there known as Big River, which meanders over a considerable part of the country and is otherwise similar to the Missouri.

The characteristic feature of the general landscape is the level of the uplands, which were a part of the Great Plains 5672
originally. The general elevations are about 800 feet on the bluffs up north of St. Louis, around Alton, and from 7 to 9 hundred feet will probably catch the highest elevations, and around 500 and thereabouts the lowest.

There are very little unbroken areas, I mean there are very little areas that are broken so that railroads can't conveniently utilize the area. They can follow the valleys of these big rivers continuously, and I will illustrate a little later the extent to which the railroads have utilized this area.

—2,456—

It is also very suitable not only for railroads, but for 5673
terminal facilities, and large industrial plants. The water supply is favorable.

As you go west and northwest of the city, you get into a rolling farm country with some rugged area, as you approach the Missouri River bluffs, which are off to the west and north. As you go south and southwest, you get into the Ozarks, which are just rough and rugged little mountains, but they don't go much above 1,500 feet maximum height.

The prairie lands, of course, are used for agricultural purposes, just like the rest of the Mississippi Valley. The

underlying geologic structure is sedimentary and rests on what is known as Archean Granite. The upper part was deposited by the rivers, and a gradual influx of the top soil has produced some very fertile valleys, washed in there by the action of the streams.

The loess, which covers the upland to a depth of from a few feet to 50 feet, is used in the manufacture of brick. It is very good for fire clay as well as common brick.

We have a lot of gravel formation used for the gravel in-
5675 dustry extensively. It is particularly good concrete gravel in that area. The Mississippi gravel is not quite as good as the Meramec. Then we have the coal strata, which extends primarily out through the Illinois region, and that is well

known.

We have the coal layer, and then the shales and the clays, all of which are used extensively for terra cotta, sewer pipe, paving brick, tile, and some of those shales in limestone are used in the manufacture of cement. We have two large cement industries immediately in the St. Louis
5676 area, and another very large one up between there and Keokuk.

Oil has been discovered in Illinois, the location, generally speaking, being about 60 miles east of St. Louis, and a little bit south. There has been no oil of consequence discovered right close to St. Louis, although at the little town of Dupo, 10 or 15 miles south, on the Illinois side, they pumped some shallow fields there for a number of years.

Q. You have spoken of deposits of lead; where are those found? A. They are found mostly in St. Francois County,

with Rivermines as the center, as shown on this exhibit. I believe that I am correct if I say that the St. Joseph Lead Company is the largest lead mining company in the world. I am sure it is the largest in this country, and it has very extensive mines down there covering a large area. As I recall it, there are 12 or 15 miles of underground electric railway haulage where they carry the ore underneath the ground, and bring it to a central shaft for elevating it to the surface. They have a number of concentrating plants, crushers, located at all of those different towns, such as 5678

—2,458—

Bonne Terre, Elvins, Flat River, Leadwood, and others. The St. Joseph Lead Company is a very large user of power.

To give an approximate idea of their use, without disclosing any figures that would be personal to them, I can say that their peak load runs in the neighborhood of 26 to 30 thousand kilowatts, and when the lead business was good, as it has been in the past, and which it is now again becoming in the last three months, they run continuously. That represents a lot of money in one month.

Q. Now without going into great detail, will you indicate 5679 the transportation facilities available in the territory? A. As I said, with regard to the topography, the railroad facilities were good from the standpoint of construction of railroads, because of the way that the valleys and rivers ran, and in the early days, the railroads began to build in there. At the present time, St. Louis is served by 19 trunkline railroads, 3 short-line railroads, and 5 railroads engaged exclusively in switching. The aggregate main track mileage operated by these trunklines is 95,200 miles, or 34.48 per

cent. of the total miles of track operated by Class 1 Railroads in the country. That total miles, by the way, is 275,506.

The trunklines, most of which terminate in St. Louis,

—2,459—

I believe all of them,—and I don't mean that they just go through there, but that in most cases is the terminus of their line—are the: Alton Railroad; the Baltimore & Ohio Railroad Company; Chicago & Eastern Illinois Railway Com-
5681 pany; Chicago & Northwestern Railway Company; Chicago, Burlington & Quincy Railroad Company; the Chicago, Rock Island & Pacific Railway Company; Cleveland, Cincinnati, Chicago & St. Louis Railway Company—that is usually known as the "Big Four"; Illinois Central Railroad Company; Illinois Terminal Railroad System; Louisville & Nashville Railroad Company; Missouri, Kansas and Texas Railroad Company; Mobile & Ohio Railroad Company; New York, Chicago & St. Louis Railroad Company; the Pennsylvania Railroad Company; the St. Louis, San Francisco Railway Company; St. Louis, Southwestern Railway Company;
5682 Southern Railway Company; Wabash Railway Company.

—2,460—

In addition to those trunk lines there are short lines: Litchfield and Madison Railway Company; St. Louis and O'Fallon Railway Company; and St. Louis and Ohio River Railroad Company.

Then the switching companies are: Alton and Southern Railway Company; East St. Louis Junction Railroad Company; Manufacturers Railway Company; Missouri-Illinois Bridge and Belt Company; Terminal Railroad Association of St. Louis.

All those lines are available to St. Louis and switch in the yards there. As a matter of interest, we recently had a fire in the terminal control station which controlled all of those trains coming in and out of that yard, and it burned up all the signal systems, and it became quite a major problem to keep the yard operating. They adopted some very interesting expedients with loud speakers at every switch throughout the yard, had men stationed there, and a man at some central point to give his orders, and the switching men would hear them over these loud speakers and operate the switch. 5684
Although they had a disturbance for six or eight hours, ten or twelve hours later they had the service going with fairly good results. They are building a new terminal switching station there now.

In addition to the railroads I should have river transportation. St. Louis is situated on the Mississippi River, Inland Waterway System, and that consists of a series of navigable rivers and canals having a total mileage of 13,394 miles, and connecting by water 29 of the principal industrial centers of 20 states in the Mississippi River Valley.

—2,461— 5685

There has been considerable activity in the river transportation recently, and completion in 1932 of dams and locks on the Illinois and Des Plaines Rivers, and the Illinois Waterway Canal provides a 9-foot channel connecting St. Louis to Chicago and the Great Lakes system of waterways.

The latest project on this Inland Waterways System is the construction of 26 dams and locks on the Mississippi River between St. Louis and Minneapolis.

They were completed in 1940 to provide a 9-foot navigable channel between those cities. I recall that the estimate on

about 24 of those dams was $132,000,000-odd, and it has been materially increased since then.

We have four airlines available to St. Louis.

I would like to mention one other item of interest in connection with transportation, which indicates the extent to which bus line transportation has developed.

A total of 367 truck lines, operating out of St. Louis, provide store-to-door delivery to 18,114 towns and villages within 44 surrounding States and Canada. They serve 1,440
5687 towns in Missouri, 1,692 towns in Illinois. Also the transcontinental and interstate bus lines, embracing 15 systems, serve St. Louis.

There is a great deal of our material these days being delivered from the point of origin to the point of receipt by bus lines. They take it clear to the final customer.

—2,462—

Q. There are a number of State and national highways that go through the city? A. There are. We are on five national highways, numbers 40, 50, 61, 66 and 67, as well
5688 as some of the main State roads. 66 is the chief highway through St. Louis.

Mr. Hamilton: I ask that this group of four sheets be marked for identification as Respondents' Exhibit 52-A, 52-B, 52-C and 52-D.

The Examiner: All right, they may be so marked for identification.

(The sheets referred to were marked as "Respondents' Exhibits 52-A, 52-B, 52-C and 52-D, for identification".)

Stanley Stokes—By Respondents—Direct 5689

By Mr. Hamilton:

Q. Mr. Stokes, will you explain what Respondents' Exhibit 52 for identification represents? A. Exhibit 52 consists of three maps and an explanatory sheet indicating symbols which apply to one of the maps. These three maps together represent the same territory as shown on Original Exhibit 51 but on a larger scale. The exhibit marked "52-A" represents the area at Lakeside.

Q. That is, sheet "A" of the exhibit? A. Yes. It is an 5690
expanded view of the little hatched area near the Bagnell Dam, and referred to as the Lakeside Light & Power Company district. It simply shows the lines of the little Lake-

side Company. They are in heavy black lines leading to the south, and branching around in among these hills.

Q. And the broken lines on the sheet represent county lines? A. Those are just county lines. I believe that is about all the description required. The heavy lines leading to St. Louis and to Rivermines shown on there represent the beginning of these major transmission lines which were 5691
shown on the other exhibit.

The exhibit marked "52-B" represents the Keokuk territory on the first exhibit, 51, enlarged. It shows the town of Fort Madison, indicates Nauvoo, Wever, Montrose, Keokuk, Hamilton, and so forth, on a larger scale.

The dotted line up in the upper part is again a county line. And these heavy black lines—the one going south is the main transmission line to St. Louis, which is the same line as indicated on Exhibit 51. The other line leading to the left from Keokuk and marked at its terminal, "To Mis-

souri Power & Light Company," is the line that supplies them with service at a point about 10 miles out, to which I referred in my previous testimony. I believe that sufficiently explains that exhibit.

Exhibit 52-C is a map of the St. Louis district showing the actual transmission lines, distribution circuits, sub-stations and other features of interest which could not be shown on Exhibit 51 because of its size.

—2,464—

5693 Sheet "D" of Exhibit 52 is a reference sheet to go with this large map, 52-C. As an example of its use, if you will look at the last word in the right-hand column, the word is "Winstanley". The symbol, or the letter is "Wi", and if you look directly east of the center of the City of St. Louis on this map, about an inch to the right of the river, you will see the symbol "Wi", indicating some transmission lines coming into it. That is what the Union Electric calls their Winstanley sub-station in East St. Louis.

Similarly, these other letters indicate various sub-stations, and usually by number or letter.

5694 Now, the distribution circuits on this map are shown down in the open area, for example in Jefferson County, you will observe the towns of Festus and Desoto, and radiating out from those towns are light lines indicating actual distribution circuits in that territory.

—2,465—

That region is pretty rough down in there, and as you get down just above Hillsboro, there are very few habitations in there, which accounts for the open territory not covered by lines.

St. Louis County and the City of St. Louis, and East St. Louis, are so heavily covered with distribution circuits that they are just indicated here by hatched areas, like they were on the original map.

Q. Now have these maps, constituting Exhibit No. 52 for identification, and the accompanying identification chart, been prepared under your supervision? A. They have, they were prepared by men working immediately for me and under my direction, and I even assisted with the work.

Q. And the facts shown have been taken from the records 5696
of the companies constituting the Union Electric Group? A. They have.

Mr. Hamilton: I offer this exhibit in evidence as Respondents' Exhibit No. 52.

Miss Calkin: No objection.

The Examiner: Very well, the three maps marked respectively Exhibits 52-A, 52-B, and 52-C, and the succeeding sheet marked 52-D, are now received in evidence.

(Respondents' Exhibits Nos. 52-A, 52-B, 52-C, 5697
and 52-D, respectively, were received in evidence.)

—2,466—

By Mr. Hamilton:

Q. Now referring to Exhibit No. 52, Mr. Stokes, and particularly to sheet C, are there set forth all distribution lines of the Union Electric Group in the area indicated? A. Well, as I explained in my last statement with regard to this map, the density of the distribution circuits in and around St. Louis is so great that they are still not shown there in detail.

5698 *Stanley Stokes—By Respondents—Direct*

Q. But other than as indicated by the legend on the sheet C,—— A. (Interposing) They are shown in so far as possible. The feature of this map partly was to show the extent to which the distribution circuits cover these more lightly populated areas, as well as to show the main points of interest in and around the city.

The little round black dots in the City of St. Louis are distribution sub-stations, which will be described later.

The main power plants were shown on the other map and
5699 can be identified there.

Q. And all four sheets of the exhibit relate to electric facilities only? A. Electric facilities only.

The Examiner: We will recess until 2 o'clock.

(Whereupon, at 12:30 o'clock p. m., a recess was taken until 2 o'clock p. m., of the same day.)

5700

AFTERNOON SESSION

(The hearing was resumed at 2 o'clock p. m.)

The Examiner: The hearing will come to order.

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

5702

Q. Turning now to the physical properties of the Union Electric Group, Mr. Stokes, will you give us the general classifications of electric service property of the Union Electric Group? A. The investment in Union Electric Group of properties is roughly divided as follows: three-fourths of the property is in transmission lines, transmission substations, and power plant; and one-fourth in the distribution system. That is a little different than the ordinary division in a utility company. It is frequently spoken of that a utility company has one-third of its property in plant, one-third in sub-transmission, and transmission lines, and one-third in distribution. But in our particular case, due to the large percentage of hydro-electric investments, the effect of changing that ratio is shown, so that is easily explained. 5703

Q. Now, will you state the total name-plate rating of your generating capacity? A. The total name-plate rating of our

combined steam and hydro-electric plant is 722,500 kw. The nature of the property is very complex, and, as constituted, it represents properties which have been acquired by purchase, and structures which have been built, and equip-

ment which has been installed through the life of the present and predecessor company.

The present property is an accumulation of years of effort directed toward the acquisition, coordination and merging of scattered piecemeal power supply facilities, into the present unified power system, which makes it possible to supply adequate power throughout the entire area.

Before going into the detail of the steam generating plant, I would like to indicate the general nature of the facilities.

5705 In addition to the plants we have had to acquire pieces of land which were strategically located for both hydro-electric development and for steam plant development. Only a certain type of facilities like that are practical where you must have either water supply for condensing purposes, or you must have a suitable place to build a dam.

In addition to the plants you have to have all of the lines, transmission lines, sub-stations, warehouses, buildings, employees, and so on, warehouses for storage of materials, telephone facilities, and a great many other types of equipment that are utilized in such work. And in describing these

5706 —2,469—

I would like to divide them into several headings, of which power plants themselves would be one major subdivision. I think that is a convenient way, as convenient as any.

With regard to the actual name-plate ratings of the units to which reference was made, it is divided into 485,500 kilowatts of steam units, and 237,000 kilowatts of hydro units. Due to steam and water limitations, we de-rate those figures to what we call our dependable rating, and take 430,000 kilowatts as our steam plant rating, and 200,000 kilowatts,

which will later require some explanation, as the rating of the hydro plants, making a total of 630,000 kilowatts.

Now that, you will observe, is quite a reduction from the 722,500 figure given as name-plate rating. I believe that I might as well explain that 200,000 kilowatt hydro rating at this point.

The actual capacity of the hydro plants is divided into two plants, the Osage hydro-electric development, or Bagnell Dam, as it is sometimes called, and the Mississippi River Power Company plant at Keokuk, which is located on the Mississippi River. 5708

The two types of development are entirely different. The Keokuk plant has very little storage, and you have to take the river flow as it comes. You can fluctuate the level of the river in the forebay above the dam by maybe a foot or so, but the dam is relatively low in head, roughly 30 feet, and

—2,470—

the requirements of river navigation are such on the Mississippi that you have to let the water through more or less continuously. 5709

Furthermore, at times of high flood, you couldn't hold it anyway, you would have to take it through the wheels or let it go over the dam. So the Keokuk plant is what we would call primarily a stream-flow plant, and naturally its output varies with the river.

The maximum output, when water conditions are favorable, is 135,000 kilowatts. That is periodically reduced to possibly 70,000 kilowatts for a few days in the wintertime, due to freeze-up, what they call the early freeze-up. That is in the early stages of the winter, up the river, as the ice

is forming, it cuts down the velocity of the water, and you have a temporary period there which rarely lasts over ten days, in which you couldn't count on an output of more than 70,000 kilowatts, although your kilowatt hours may be steady. In other words, we are not dealing here with a minimum quantity of water, but rather with a retarded type of flow, due to ice conditions.

In the summertime, in a dry year, the minimum condition approaches the same figure, due to low water. Now at
5711 the Osage plant, Bagnell Dam, we have a high-head plant there of about 100-foot effective head, and a storage reservoir containing a huge amount of water. The fact of the matter is that it is in the same general classification as Boulder

—2,471—

Dam, with regard to storage. It is not quite as large, but very close.

The shore line of the lake, for example, is about 1,300 miles, that is to say, considerably farther than from St. Louis to New York City, if you followed the shore line of the lake all around. So it is really a big storage reservoir.

5712 Now that one is to a large extent independent of stream flow, and is available at any time you want it, but if you use it, it will take time to recover it again. So that if we have normal water power conditions in the spring, we get roughly 130,000 kilowatts, with some degree of regularity, from the Osage project, and with 135,000 from Keokuk, or the Mississippi River project, we might have 265,000 kilawatts, which would be available almost constantly for three months

But you might say—why do we rate them at 200,000? Well, that rating is the firm capacity which we can guarantee

available over the entire winter peak season, just as though we had a bunch of steam plants sitting there to do the same thing. And it is what we refer to among ourselves as the cut-off capacity for winter peak.

That is to say, it is the amount of kilowatts that that hydro plant, utilizing its storage, can actually cut off from the top of our system, and as you can readily appreciate, the amount of peak that can be cut off in that manner is related

—2,472—

to kilowatt hours, because the reservoir holds just a certain 5714
amount of storage, and if we want to run that through very rapidly, the actual peak capacity of our wheels is something like 160,000 kilowatts, but if we want to run that through at a rate which will supply all of the kilowatt hours over the winter peak period, which occur in the top 200,000 kilowatts of our load, then we have accomplished what we set out to do, and have cut the winter peak by 200,000 kilowatts.

I go into this lengthy explanation because the figures appear to be conflicting, and they really are not.

During the spring season we take advantage of the excess water available for overhauling the big turbines, steam tur- 5715
bines. We take one of them down, like a 75,000 kilowatt unit, and overhaul it during the period of plentiful water supply. Then, during the summer, we run those turbines, take a dry year, for example, at their capacity and keep the reservoir as a reserve.

So at one time of the year the reservoir is operating as quick-starting reserve, it being started in less than 3 minutes,—sometimes we keep one of the wheels running all the time, and the gates throttled down and just letting enough water in there to keep the wheel up to speed, and if the fre-

quency of the system drops just a fraction of a cycle, there is a device that trips the wheel and it comes right back up to speed in the matter of a couple of minutes or less; in other words, sufficiently quick so that we would be able to hold

—2,473—

the load against the loss of a big steam unit.

(Discussion off the record.)

5717 *By Mr. Hamilton:*

Q. Now you have named two of the generating units, two of the generating stations, in your system. Will you name the others? A. I have named the two hydro-electric plants. Now the steam plants are, first, the Ashley Street Station.

Q. You might locate these on the map. A. The Ashley Street Station is located in the City of St. Louis, as shown on Exhibit 51 by name, and it is marked. It is a Union Electric Company of Missouri plant.

Q. It is shown on the exhibit as "A-S", is it not? A. That is correct.

5718 Q. I think it is apparent from the exhibit, and you are referring to Exhibit No. 51, are you not? A. Yes. All the "S's" refer to steam, and the "H's" refer to hydro.

Now then, that plant is the first large steam plant that supplied the City of St. Louis. It is located on the Mississippi at the foot of Ashley Street in the City of St. Louis. At one time it supplied the entire load of the city. It has been repeatedly added to from time to time, and is very essential even to our present operations today.

—2,474—

The chief necessity for it today lies not only in the generating equipment itself, which is both 25 and 60 cycle, but it serves as a steam heating plant, and it has a large amount of sub-station facilities, either in or adjacent to the building, which are very fundamental to the operation of the city's system. I will describe that in a little more detail later.

The plant itself acts further as a reserve for our general system operations. Its economy today is not sufficient to warrant its long-hour operation, but its reliability is very high, and in combination with the hydro system it serves a most useful purpose. 5720

The present plant contains a generating capacity of 5,660 kilowatts in 25 cycle equipment; and 42,000 kilowatts in 60 cycle equipment, name-plate ratings.

The steam heating requirements which, in January 1940, were 625,000 pounds of steam per hour, maximum, during the winter peak, limit the electrical output of this plant at such time to 65,000 kilowatts, after the two boilers which are now under construction go into operation this winter. They are just ready to be tested out now. The capacity in the plant can be operated at either frequency, and to that extent it has the characteristic of a large frequency change. I should explain at this point that the Keokuk system is 25 cycle generation. At the time Keokuk was constructed, it was not possible to transmit power that distance, approxi- 5721

mately 146 miles, at 60 cycles, and even today, with our present knowledge we would have to reduce our amount received by a very considerable amount if we had to take it at 60

5722 *Stanley Stokes—By Respondents—Direct*

cycles instead of 25 cycles, 25 cycles being much preferable for transmission.

Also at that time there were no 60 cycle rotaries available, and the majority of the load to be supplied from Keokuk was street railway load.

At the present time over 60 per cent. of all the kilowatt hours produced by the Keokuk plant at 25 cycles is actually consumed by the ultimate consumer at that frequency, either in railway load or heavy industrial load. Very little is used
5723 for lighting.

The part of that which is still being used for lighting is being replaced at the present time with 60 cycles, about which more will be said later.

The steam heating load being materially reduced in the summertime, down to about 100,000 pounds per hour, instead of 600,000 pounds, gives us available 500,000 pounds of steam per hour to be used for electric generation if we want to.

Q. You are now talking about the Ashley Street plant? A. Yes. The only digression on the Keokuk plant was made for the purpose of explaining this 25 cycle and 60 cycle gener-
5724 ation at Ashley Street.

Ashley Street having available, then, in the summertime,

500,000 pounds of additional steam, which can be used either through 60 or 25 cycle machinery, provides a very attractive reserve to the Osage hydro-electric plant, whose minimum output will occur in the summertime in a dry year. Those two fit in very nicely.

Ashley Street 25 cycle generation itself was put in, was included in the contract which was entered into about 1913 between the Mississippi River Power Company and the then

Union Electric Light & Power Company, for the service itself, a 99-year contract. And the Ashley Street plant was recognized as being a necessary reserve for the Keokuk. Otherwise, a reserve steam plant would have had to have been built, and that is still the case.

—2,477—

The annual load factor on the 25-cycle generation at Ashley Street is relatively low, but it is used in conjunction with the Keokuk generation to supply the load.

To continue with the thought that I was about to bring 5726
out a few minutes ago, namely that over 60 per cent. of the kilowatt hours were ultimately used at 25 cycles, that explains why, to a large measure, we have no particular interest in trying to change the frequency. The situation is static. The river is not producing any more power than it did in the beginning, we are not selling any more firm 25-cycle power, we are keeping the status quo and the customers, themselves, could not afford, nor would they care to, to spend any more money to change their equipment. Nobody would gain anything because the 25-cycle equipment, used for industrial power work and for street car work, is equal to or better than 5727
60 cycles. There is absolutely no advantage if you already own the equipment. If you had to buy it, 25-cycle equipment, in general, costs more than 60-cycle equipment.

Therefore, we have a growing 60-cycle load and a static 25-cycle load, and if anyone on the 25-cycle system wants to obtain additional excess or secondary power, we are delighted to sell it to him, but it isn't firm. On the other hand, if he wants firm power, we will generate that at St. Louis by steam, put it through frequency changers, and deliver it to him.

—2,478—

5728 *Stanley Stokes—By Respondents—Direct*

Now that in itself is a simple operation for us because we merely reduce the amount of transmission that we otherwise supply; that is, we really generate our own load and do not send as much up under reserve conditions.

The result is that the various studies that have been made from time to time with regard to the possibilities and advantages of converting Keokuk to 60 cycles have always been proved the opposite. The best thing to do is to keep it as is and take all the growth at 60 cycles.

5729 Now, to again get back strictly to Ashley Street, you cannot discuss Ashley Street intelligently without relating it to this 25-cycle system. I am talking about the older part of the plant.

The use of this 25-cycle energy in St. Louis, aside from the street railway company, is in the Edison down-town district where it is used as direct circuit, and in the supply for that Edison system we get the source from both the 25 and the 60 cycle connections, and thereby obtain a degree of reliability that we could not obtain if all the supply were obtained from either system, the two systems not being elec-

5730 trically connected in any other way.

Now in the 60-cycle equipment at Ashley Street, we have it connected by means of cables and transformers to our larger plant which I shall discuss. But it is essential that Ashley Street, although not by any means the largest plant on our system—and it is the oldest—it is essential that a

clear understanding of its position in St. Louis be had.

I may have to again refer to it later in the discussion on transmission because it is a focus of a number of plants

and is centrally located and serves so many different purposes; that is, although it is old I believe it probably is one of the most effective plants that we have because it, first, to summarize, supplies the steam heating requirements; it supplies the reserve for the Keokuk hydro plant; it acts as reserve for Cahokia plant, which will be described shortly, and supplies the service to the downtown Edison district,—half of it, the other half coming from the 60-cycle plants.

Now I shall describe the Cahokia steam plant next. That is located on this exhibit on the Illinois side of the river at 5732 St. Louis, and is named on the print——

Q. (Interposing) That is indicated by "B-S", is it ~~not,~~—indicating the Union Electric Company of Illinois? A. Yes. This plant is our largest plant and one of the largest in the United States.

The total installed capacity is 300,000 kilowatts in six turbo-generator units. There are 24 boilers outputting at 325 pounds pressure, and burning pulverized fuel. The plant, as recently constructed, had one of the first units as a 35,000-kilowatt unit. We found it possible to extend the boiler capacity and replace that unit with a 75,000-kw. unit 5733 —2,480→ in the same space, which materially increased the capacity of the plant, with moderate costs.

The unit which was removed was transferred to a plant which we call Venice No. 1, which will be described.

The Cahokia plant, which is located right on the river bank, on the east side of the river, transmits its power into St. Louis largely by means of underground 33-KV and 13,000-volt cables. It is also connected to the transmission system in the Illinois district by a number of 66,000-volt circuits and

two 50,000-kilowatt banks of transformers. More will be said about that under "sub-transmission system".

The plant is also connected to the Ashley Street station by a number of underground 33-KV submarine cables, they going submarine under the river and then underground the rest of the way to the Ashley Street station.

To summarize the figures, there are 28 of the 33,000-volt submarine cables laid in the river, and six 13,800-volt cables. I should have mentioned that they are also 33,000 volts, but
5735 they are operated temporarily at 13,800.

The plant is connected to the Illinois area by three 13,800-volt and three 33,000-volt and two 66,000-volt lines.

It is connected to the Page Avenue sub-station and to the Venice station, as is shown rather sketchily on this exhibit but the lines indicated there at Cahokia go north a short distance to the Venice plant, which is named and marked "B-8";

—2,481—

thence, they go to the left to the sub-station marked "Page Avenue", shown with a "A" on it.

Now that transmission is from Cahokia to Venice by
5736 overhead double-circuit 66,000-volt lines, each circuit capable of handling 50,000 kilowatts.

From the Venice plant on to Page Avenue, by underground 66,000-volt submarine cables where they cross under the river and thence by underground cables to the Page Avenue sub-station.

The use of the 66,000-volt submarine cable was somewhat of a problem. The cable itself had been in use possibly five or six years, or a little longer, both at Cleveland and Chicago, but as far as I know this was the first application

of 66,000-volt submarine cables. Such cables are not essentially different from land cables, but have to be treated quite differently in the process of laying. They are reinforced with armor, over and above the lead sheeting, and that is protected by jute, and there are various coatings to protect them from erosion by the sands in the river, and from fish, and from anchors dragging, and various things that may happen.

But the primary difficulty is to lay the cable itself across 5738
the river with a boat which is in constant motion from the currents and getting it laid down so that it is not cracked, so that the lead is not cracked, and so that it lays properly to provide for shifting of the sands on the bottom of the river, so that if the sands were to be washed out underneath it, it wouldn't be left unsuspended through a long

unsupported span.

There are a number of things to be taken into account about which knowledge was not altogether available at the time. We have had more submarine cable experience than 5739
anyone else in the country, because altogether there are 38 or 39 of these cables now crossing the river from Cahokia at 33,000 volts, and we have had to pioneer that work at considerable difficulty, involving the loss of some of those cables which would not occur today with the knowledge we now have.

That is one of the things you have to learn and have to do with the matter of treatment of the bottom of the river, to keep it from shifting. But that was successfully overcome and those cables are working very satisfactorily

from Cahokia, and also are carrying the load successfully over the 66-KV route.

The determination of those 66-KV underground cables from submarine to land, offered a little problem which was successfully solved, and they are working all right.

Q. How did you solve the problem of shifting sands? A. We found it necessary to lay what is known as a mattress, the same type of protection that is used by river people up on the bank. We had to go down in the river and
5741 make up a woven mattress, either out of willow rushes or 1 x 3 oak planking, and you make up a mat like that and sink it by means of loading heavy rocks all over it, and, then, having got that weighted down in the river and loaded

with rocks, you pin it there by driving piles through it, carrying them down to the point at which any navigation would not be bothered. That makes a firm footing; and as you approach the shore, the trouble is always that at the edge of the bank, down deep in the water it shifts. The
5742 middle of the channel doesn't shift so much. All we do in the middle of the channel is to see to it that the cable is laid with plenty of slack upstream so that any washing-out will permit it to settle in place without damage, and by making a firm footing, as you approach the bank, the last two or three hundred feet, we have eliminated the difficulty.

Q. How long are these cables under water? A. They are about 2,500 feet in general, and that was the source of our greatest single difficulty.

To begin with, we couldn't get a cable over about 1,300 feet in one length, and we attempted to join it in the river.

Making a 33,000-volt cable joint is somewhat of an undertaking even out on land, in a room where you can control the moisture content and where you can get this thing properly taped up, with hot oil kept pouring over it all the time, and then making a good lead seal. All of which takes from 24 to 36 hours, even under the most favorable conditions, on land.

Well, the only way we could do that was to do it on a boat, and the boat kept rocking all the time due to the current and the waves, and you just can't keep bending a lead cable 5744
continuously for 36 hours that way, and where the cable

was suspended over the sides of the boat it showed, some years ago, that the lead had been damaged, and nobody knew any way to avoid that.

So we attempted to obtain a cable in one length, and after considerable negotiation with the then Standard Underground Cable Company—they are now General Cable—we arranged to have a special reel built which could be handled by our large cranes, made out of steel, and that was shipped to the cable company and the cable company doubled the 5745
length of their building in consideration of our giving them an agreed-upon set of orders for a certain number of years for these cables, and they built us the cable in 2,500-foot lengths, and so we laid it in one piece, starting right across the river and finishing the job before we stopped.

The Cahokia plant is connected to the Ashley plant by a number, about five, of 33,000-volt tie cables. Those are heavier cables than the ordinary feeder cables, heavier in capacity and size of copper.

5746 *Stanley Stokes—By Respondents—Direct*

So that we now have the Cahokia plant and the Ashley Street plant properly connected, and we have briefly mentioned the transmission connections north to the Venice plant, which I shall now describe.

Before leaving the Cahokia plant I should say that this description which I gave was very meager from the standpoint of a plant of that character. Roughly, there is around

$32,000,000 invested in the plant, not including the sub-sta-
5747 tions which are part of it, which would represent another five or six million. I mention that to indicate the size of the plant.

Incidentally, the plant is well supplied with land in a district in which such land is next to unobtainable; that is, there is only a limited amount of river footage available, and it is practically all being used for essential industries, some of which could not be acquired today even by condemnation because it is in the public interest for so many purposes, such as railroad yards and other facilities, that if a more or less farsighted judgment had not been used in acquiring this
5748 property of some 56 acres at the time we started the plant, we probably would be somewhat handicapped in attempting to obtain it today.

The Venice plant is located in the area referred to as Venice, Illinois, a little town shown on the map marked, as I said a minute ago, "B-S", being owned by the Union Electric Company of Illinois and located on the Illinois side of the river.

This plant, as now constituted, is just a moderate size plant with a total capacity of 62,500 kilowatts, and limited by a boiler capacity to 40,000 kilowatts, present output.

We can bring that up to 62,000 any time that it justifies the expenditure, but temporarily we feel that the immediate requirement is better served by the construction of a new plant adjacent to the present one.

—2,486—

The basis of reasoning there is this: A 20,000-kilowatt gain in capacity is not sufficient to serve us even for part of a year at the extremely rapid rate at which the load is now growing under the National Defense requirements, and yet 5750
there have been times in the past, and there will be times in the future, when this 20,000 kilowatts—(I say there will be times in the future, there may)—when this 20,000 kilowatts might suffice for a year's growth.

At such times, that type of development will be economical and is contemplated, but at the present time we don't see any necessary or desirability of attempting to increase that boiler capacity merely because we have an extra 20,000-kilowatt turbine in the building.

The plant is connected, a distance of 4.8 miles, to Cahokia, as stated, by these two 66-000-volt circuits, and the 5751
cable circuits which I mentioned to Page Avenue are 7.94 miles long.

Some load in St. Louis is supplied by the 33,000-volt submarine, sub-transmission cables, that is, they are cables out of the Venice plant to the Missouri side, just as they are at Cahokia except there aren't so many of them.

The Illinois loads are supplied by four 66,000-volt overhead steel-tower transmission lines, two of which go north and supply the Alton district, and two go east and supply

the Illinois-Iowa Power Company, which was mentioned in the testimony this morning.

—2,487—

The Alton district is growing very rapidly and service in that district is rendered to various industries such as the Owens-Illinois Glass Company, an electric furnace project, and the Shell Oil Company refinery. This latter refinery has been growing at a huge rate for the past year, increasing their load by, roughly, almost 1,000 kilowatts a month. A
5753 year and a half ago they had a load of about 5,000 kilowatts, and they anticipate 14,000 by the end of next year. The load factor of that load is the highest that I have ever seen any record of, running 90 to 91 per cent. on the monthly basis, and apparently that will hold on an annual basis at the way they are going.

That is all you can do if you run the machine just as steady as you can all the hours of the year, because the little variations within the cycle account for the difference, and service requirements there are extremely rigid. We have a very enviable record with both the oil company and the
5754 glass company up there, both of whom have service requirements that are far above normal.

I think that it is well to mention at this point that if our service were to be totally cut off for any length of time from the glass company, and let the big furnaces with their molten glass harden up, they would have to be chiseled out at a huge cost; and the Shell Company has a number of operations in the refinery there which would represent extensive loss of

—2,488—

property, and even a hazard to life, if the service were kept

off for a very considerable length of time. They have actually some provision of their own for relief, but inasmuch as those things have never actually been tried out, there is always some question as to just how well they would work.

We feel very strongly the necessity for service reliability in the district. So far, we have had service up there for a number of years, and with great satisfaction. We can refer to both of those customers whenever we have any questions to discuss about service reliability. We have new equipment, good lines, everything the best there is, and a most elaborate 5756
relay protection system, everything is duplicated.

As a matter of fact, the St. Louis district would rank very high in the entire country if it were to be rated on the percentage of our lines that are duplicated to the customer.

We have a large number of radial circuits to which these large customers are connected on more than one, that is they have at least duplicate service.

I mentioned the proposed new plant at the Venice site immediately adjacent to the present building. We have a very valuable site of land there and are in the process of constructing a new plant whose ultimate rating is intended to 5757
be 400,000 kilowatts, and the initial step consists of two 40,000-kilowatt high-speed units, 850 pounds pressure, 900 degrees temperature.

That plant is expected to be in operation before the winter

of 1941. We are crowding it with all speed, and hope to do some testing in there not later than the first of September, next year.

There are a number of difficulties in a river plant that do not occur in a lake plant or in most of the eastern sea-

board plants where they have good rock foundations. We have to go down from 85 to 100 feet to get to rock, or depend on a floating type of foundation.

The Cahokia plant was built on what may be called a mattress, which is buried way down, and depends on the mattress and lots of piling, and then a hig heavy sub-base, and then a concrete box; in other words, the construction corresponds to a battleship floating in sand, rather than in water, and has to be made self-contained, and has to be cal-
5759 culated to be sure that it won't float under flood conditions; it had to be calculated to be sure that it wouldn't float under the 1884 high water which went some 35 feet above our normal low water.

I actually made a calculation and found that if all the machinery were to be removed from the plant it would be theoretically possible for it to float, if you had the highest water that had ever been recorded.

Actually, there is no danger of it, but it was a calculation that had to be made. The difficulty of those foundations was considerable, and the expense was fairly high, and when
5760 we got to the Venice site we had 15 feet less.

—2,490—

Well, that doesn't sound like very much, but when you are driving 85-foot piles, another 15 feet might become an impossibility. We made a lot of test borings, and decided we would drive 12-inch steel piling with a special head on it, filled with concrete, and the result was successful, and we are driving those with great success and are delighted with having decided to do it. Two-thirds of them are already driven at the new plant, and there are only about two or

three firms in the United States that can do that kind of work, and it is a very great relief to us to know that we can go the 85 feet there and get on solid rock without having to work such elaborate precautions.

That plant should be as efficient as we can possibly justify, with our coal costs, and it is designed with every conceivable facility for a reliable operating plant.

We have reasonable expectations of getting the same type of economy that has been obtained in three or four other recent plants with machinery of that character. We gave 5762
careful consideration to the use of 1,250 pounds, 925 degree plant, but such a plant is so much more expensive to build than this type, is only slightly more efficient, and with our coal costs which are low, relatively, with relation to the eastern seaboard, we didn't feel that we could quite justify the expenditure. —2,491—

We also have to take into account the fact that a good part of the energy in our system is derived from water power, and that all of those things, taken into account, would cause us to select a plant which was most suited for the particular district, rather than the most highly 5763
efficient plant which could be theoretically built, in attempting to get the minimum cost of power, including fixed charges.

The next plant which I should like to describe is the Rivermines plant. It is located on this exhibit in the southern territory in St. Francois County, and is marked—it is a Union Electric Company of Missouri property, and is marked "A-S", the "S" standing for "steam".

It is a plant which was originally acquired from the St. Joseph Lead Company. At the time we built the Osage

project, or Bagnell Dam, we also acquired the load of the St. Joseph Lead Company in St. Francois County, the load brought about by their lead mining, and we acquired the plant and obtained their load. The plant was in good condition, with two 12,500 kw. units, and very quick to start, reliable, and we have retained the plant and have actually run it this year several weeks for peak reserve, and keep it in operating condition at all times.

It isn't a continuous operating plant, it is what we call
5765 a cold stand-by in most years. It would only be run in the year before bringing in a new plant. Do I make my point

clear when I say that these things are operated in the year just before bringing in a new plant?

That is to say, what we mean is that we utilize all of our reserve facilities in so far as we can so that we can schedule the bringing in of a new plant with perfect safety, but without getting it in before it is needed, because if we do, we are wasting fixed charges.

And in that way, we bring in the Osage project with
5766 its reserve cut-off feature, and have these other plants available so that if we were to lose one of our largest units, we could go right ahead.

And as the load approaches the point at which the loss of the largest unit would have any bearing on carrying the loan, then these plants are started up and run.

At this plant is a major switching station for the two 138 kv. circuits which go from the Bagnell Dam, or Osage, to Rivermines, that is, the southern route shown on Exhibit 51.

At the Rivermines plant we not only have this major switching station, but two 25,000 k. v. a. synchronous condensers for controlling the operation of the transmission lines; and a very extensive distributing substation having an installed transformer capacity of 75,000 kilowatts, which serves the St. Joseph Lead Company, and which also serves as distributing sub-station for our own load.

You see we have, in addition to the Lead Company load,

we also serve the area in all those small towns around there, 5768
so that this sub-station supplies all of those requirements.

We have five 33 kv. outgoing lines from that point for our own use, as well as a large number of cables supplying the Lead Company mines directly.

The service requirements there are again very rigid. Those mines are very rapidly operating mines, with high-speed hoisting, underground electric haulage of a good many miles, and they use a type of electric undercutting and digging machine which they themselves developed. It is a peculiar sort of a shovel. I have seen it work. At the end of one of these mine tunnels, it is difficult to operate an 5769
ordinary type of machine, because your tracks have stopped, and you are blasting out ahead of your tracks, and you have got no supply or anything in the last 15 or 20 feet, that is, you are working up against a blind wall in which there will be a bunch of jagged rock as a result of a blast, and you have got to get out ahead of everything you are working with, or else use a hand shovel, which is the ordinary method.

Well, they developed a sort of an unloader, built it themselves, that corresponds to a small-sized steam shovel,

working with very limited room, which carries over the top and sticks out and picks up the rock, bringing it back over the top, between the top of the tunnel and the car, and drops it in the car behind them, and they build the tracks up as fast as it gets the rock excavated.

—2,494—

In the beginning they had lots of minor difficulties with the thing, one of which was that the men weren't particularly keen about it, that is, the miners themselves. They
5771 were afraid it might work too well; as a matter of fact, it did work well, and they are using a number of them right along, but they have also expanded their mining operations, and the miners' fears were unfounded. There are more miners working there today than in those days, and the machines are also working.

The pumping load down there is something of consequence. There are several thousand kilowatts used in de-watering those mines, and if those pumps were to stop for 18 hours, I don't know just how many hundreds of thousands of dollars it might cost to de-water the mines,
5772 but I should imagine that it would probaly cost somewhere in the order of a million dollars. There is very little danger of that, because there are so many sources of supply, and we have the local steam plant. And if a tornado were to take that plant out, we could get the lines rebuilt in less time than the water would become serious.

So neither they, nor ourselves, are concerned about it, but we have to have facilities, which we have.

Q. Now you have named the steam plants, and you have referred very briefly to the two hydro-electric plants. Could

—2,495—

you add, however, to the description of the Keokuk hydro-electric plant? A. The Keokuk hydro-electric plant, which was constructed and ready for operation the latter part of 1912, going into service in 1913, is a beautiful hydro-electric plant. I like to use that expression "beautiful", because I have seen a great many of them, and today it is one of the nicest looking and best constructed plants with which I am acquainted.

When you step into the main turbine room and look about a quarter of a mile down the room, over 15 of these big units, 5774 it is quite an imposing sight.

Today you could build the same plant with larger units, and less of them, and it wouldn't be any better, it wouldn't be as good, because you have a greater chance of losing units then than we do up there. We have never lost any units accidentally in the life of the plant, and if we did, they are small and they wouldn't have any particular significance, and if such a plant were to be built today, with larger units, and fewer of them, the actual cost would be much greater than the cost was at the time, as far as the construction itself.

The reliability of that plant has been most remarkable. 5775 There have had to be some repairs on the dam, due to ice damage, but nothing of consequence, and the only equipment which has shown any particular signs of depreciation at all, has been the transformers, which have received very heavy, hard use, and a little at a time they are being replaced. They

—2,496—

were put in in 1912, and this is 1940.

Now that can be readily explained. In the St. Louis district anything put in in 1913 would have been obsolete today because of the changing requirements, the load increase—

everything is changing. Short circuits are increasing, oil switches have to be replaced, and many things have to be done which do not have to do with the depreciation, but rather obsolescence, whereas, in a hydro plant, you never can get any more out of it in the future than you did in the beginning, because the river doesn't change.

Consequently, those requirements remain practically fixed, and it becomes a case of wear-out only, and with careful maintenance, freedom from smoke and dirt that is asso-
5777 ciated with a plant of that kind, I don't know how long that equipment may last. But I have had some inspections made of the insulation and found it to be remarkably good. It is quite a tribute to the engineering that was done at that time.

Now the plant itself was designed for a head of 32 feet; a total installed capacity of 108,000 kilowatts, name-plate rating. The machinery has been operated all these years on a temperature schedule basis, in which the load given the machinery is determined by the surrounding temperature and certain other conditions, and we have had remarkable success with the generators, and when the water is available we
5778 rarely ever run them under 135,000, with a name-plate rating

of 108,000.

Q. Why do temperature conditions enter into a determination of the loading? A. Answering your question, the limiting capacity of any electrical machine is determined by the limiting temperature at which you can operate the insulation surrounding the wires in the generator or transformer. That sets the top temperature. Now the temperature rise in the machine has to be measured above the surrounding air,

or if it is a water-cooled machine, above the surrounding water temperature. The result is that in very cold weather a transformer setting outdoors could safely carry more load than it could in a very hot location. The result is that we prepared, as a result of experience and data, accumulated over years in St. Louis, and as a result of examining equipment which has operated for many years, and which has been taken out of service due to failures or for other reasons,—examined the condition of the insulation, and knowing the condition under which that machinery has been operated, 5780 we concluded that certain operations will not damage the insulation materially. We know, whenever we overload a machine, that we are going to get somewhat less life out of it than if we keep it below its rated load, but it is very frequently the case that you can carry more than the rated load without damaging the machine appreciably and thereby get

the most out of it over its life.

(Discussion off the record.)

The Witness: While we were discussing the capac- 5781 ity of the Keokuk machines being operated at a normal load of 135,000 kilowatts with a name-plate rating of 108,000, I should like to mention the condition that existed at the other end of the Keokuk transmission line, at the St. Louis end.

There we have two banks of transformers rated at 56,000 k. v. a. maximum rating. They have blowers on them, and the blowers can be operated to obtain maximum rating. The operating department reported

5782 *Colloquy*

that we were from 2 to 5 thousand kilowatts short on capacity in those transformer banks, and we were losing a certain number of k. w. h. from the hydro plant by reason thereof.

The engineering department, over a period of several months, made a careful study of the design and characteristics of those transformers, and produced a table giving the operators a statement of what load they could put on those transformers at certain out-
5783 side temperatures, for so many hours. In addition to that, they made an equivalent table showing the number of k. w. h. that they could take through them in any 24-hour period, as they have quite a heat capacity and it takes them quite a while to warm up, starting from cold.

The result was that they put that schedule into operation and hadn't been running more than ten days when the Keokuk operators called up and said

that they were unable to deliver the capacity because
5784 of their own transformers. In other words, a scientific method of operating these transformers provided all the required capacity, and if you have today a couple of thousand kilowatts, and multiply it by the number of hours in a year, it runs into a good deal of money.

I want to bring that point out to illustrate the effective use of equipment, and to state that the customer has to take his own responsibility in making such decisions, and that very meager data is in general available from which to draw conclusions.

Now the Keokuk plant is connected, as I said without much detail before, to St. Louis by 110,000 volt, 25 cycle transmission lines, stated here to be 143 miles long. I have always regarded that as 146 miles long, but I think either figure is acceptable. It is connected at the Page Avenue sub-station in St. Louis, which I have previously located on this map.

The line is tapped to supply sub-stations at Hull, Illinois; Meppen, Illinois, which furnish energy to 5786
the important loads at Quincy, Illinois; Ilasco, Missouri; and to the Alton and East St. Louis industrial districts.

In addition to the transmission circuits to St. Louis, the Keokuk plant supplies the City of Keokuk, Iowa, and surrounding territory, including a number of large industrial customers. These are supplied

through twelve 11,000 volt circuits—those are the same industrial customers to which we made reference this morning; two 33,000 volt circuits extend 5787
north to Fort Madison, which is indicated on this exhibit, to Burlington, Iowa, and supply service to that area, and to the Iowa Southern Utilities Company at Burlington, which was mentioned.

These circuits are carried on two separate single-circuit wood pole lines, one on each side of the river, to Fort Madison, a distance of about 20 miles; and from Fort Madison to Burlington, a distance of 18½ miles, they are carried on a double-circuit steel tower line which is designed for 66,000 volt operation.

5788 *Colloquy*

The plan is to, when required in the future, rebuild the present circuits from Keokuk to Fort Madison for 66,000 volts, and then we will have continuous, one continuous 66,000 volt line all the way from Keokuk to Burlington.

At Fort Madison, the service is in the process of being changed from 25 to 60 cycles, that is, for the town itself, and two frequency changers are being installed, and the entire load in the area, with the
5789 exception of a few industrial loads, is being cut over to 60 cycle service. The cost of this, and certain other comments, will be brought up again later.

The single-circuit 33,000 volt wood pole line extends out and supplies service to the Missouri Power & Light Company. That was mentioned this morning,

but I want to get them all in here at this time. That was this line shown on Exhibit 52-B, as coming out from Keokuk, and it has a statement here, "To
5790 Missouri Power & Light Company".

The Illinois-Iowa Power Company—all of these companies having been mentioned this morning, but no further information was given as to how they acquired their power—purchases energy at Hamilton, Illinois, which is across the river. The dam extends across the river, and the cable and circuits go across in the dam, to Hamilton. And the energy is converted over there to 60 cycles and transmitted over a 66,000 volt double-circuit line, eastward through Illinois, by way of Galesburg, toward Kewanee.

The Illinois-Iowa Power Company owns the frequency changers.

The Central Illinois Public Service Company was also mentioned earlier, and it acquires its supply at Keokuk, Hull, Quincy and Meppen, and converts it to 60 cycles, and supplies the western portion of this Illinois system. They also have frequency changers at those places, which are owned by themselves.

I would like to correct that statement; those are owned by the Illinois Public Service Company, the 5792
one to whom they sell some power. That company has not been previously mentioned. It isn't one to whom we sell direct.

I believe that about covers the Keokuk plant.

Q. Will you add to your previous description of the Osage

—2,502—

plant? A. The Osage plant is located on the Osage River, near Bagnell, Missouri, 46 miles south of Jefferson City. The dam is a gravity type concrete structure, 2,543 feet long, 5793
148 feet high from bed rock to the highway deck. The reservoir covers an area of 95 square miles, is 129 miles long, with a shore line of 1,300 miles. The designed head of the plant is 90 feet. We usually run over that head, but that is the head for which it was designed, the one for which the wheel itself is designed. It operates better, of course, at a higher head, and we lose power at a lower head.

Each of the six units is rated at 21,500 kw., to give a total plant rating of 129,000 kilowatts. Now that brings out the limitations of the name-plate rating. Those wheels can be

5794 *Stanley Stokes—By Respondents—Direct*

operated at 26,500 kilowatts at a little higher temperature, and as a matter of fact they are generously designed, and we can run them at 30,000 continuously, without ever reaching the designed temperature.

So there is no limitation whatever in the wheels, and the rating of 21,500 doesn't have any bearing on what they can do.

Our normal output there is usually taken as about 130,000 kilowatts. Energy is transmitted to St. Louis over the two
5795 routes previously described. Those transmission lines themselves will be more fully described at a later discussion of

—2,503—

the transmission system.

Now I have covered the description of our major power plants, but we have one sub-station which is of so much importance in our system that I would like to describe it along with the power plants, and if I may, I would now like to describe the Page Avenue sub-station. It has already been located on the map.

The Examiner: We will take a short recess.

5796

(Whereupon, a short recess was taken, after which the hearing resumed.)

By Mr. Hamilton:

Q. Will you resume with your description? A. This sub-station, which is located just outside the western city limits of the City of St. Louis, in St. Louis County, is the terminus for two 138,000 volt transmission lines from the Osage hydro plant, also the terminus for the two 110,000 volt circuits

from the Keokuk plant; is also connected to the Venice plant by two 50,000 kilowatt, 66,000 volt cables; and by a continuation of the same cable route, on overhead circuits, from Venice to Cahokia, as described previously, it is also connected to the Cahokia plant.

The result is that there are four power plants which can feed their output into the Page Avenue station. We distribute, for residential and commercial purposes, about 27,000 to 30,000 kilowatts of load at that point. We also distribute, at 25 cycles, several thousand kilowatts of in- 5798

—2,504—

dustrial load, which goes to some cement companies, and to the railway company.

Thus, the station is a most important feature of our system, and we have to be very careful in the design of all of the equipment there to be sure that we avoid a fire risk or failure of any kind, and everything is duplicated.

The yard around the plant is quite extensive, and is conveniently filled with transformers. If you were to stand on a viaduct overlooking the plant, it looks like a forest of transformers and radiators. There are actually 404,500 k. v. a. of transformer capacity in the station, most of which is in the yard. 5799

In addition to that, there are 60,000 kilowatts of a particular type of frequency changes. This group of transformers, which I believe is about as big an aggregation as you would ever find in any one sub-station, is at all voltages from 138,000—60 cycle, to 66,000—60 cycle; 13,200—60 cycle; 33,000 volts—60 cycle; and 110,000 volts and 13,200 volts—25 cycle. We have all those voltages and frequencies,

in addition to which we transform to a distribution station in the same yard, and distribute through a multiplicity of feeders at 4,150 volts. That 4,150 volts is usually referred to as 2,300/4,000 distribution. The individual single-phase circuits are 2,400 volts at the customer.

—2,505—

The frequency changers are known as Scherbius types, and were first developed for application in the steel mills on a little different basis, but the principal was interesting, and
5801 in our case it was almost essential that we use that type of machine, which costs more than an ordinary frequency changer.

I will explain that as well as I can. The 25-cycle system at Keokuk is a right extensive system. It also has possibilities of being interconnected with other systems of even possibly larger magnitude. The 60-cycle system is already extensive, having several hundred thousand kilowatts of 60-cycle generating plants connected to it.

The result is that any machine placed between those two systems will be subjected to a tremendous twist or torque
5802 if there were a short-circuit or shift in frequency on either system.

Investigations were made to determine what type and size of frequency converter or frequency changer—which is the same thing—could be adopted. If we used a straight synchronous-synchronous set, the calculations indicated that we would twist the shaft off on any machine smaller than probably 40,000 kilowatts, and if we were to put in 40,000-kilowatt machines, which we didn't need at the time, we only needed 20,000 to begin with, that if any extensions were

made to either system, such as the plant we are now building on the 60-cycle end, or if some connection were made to the Keokuk system through other utilities, and the requirements would then be increased, that that machine would be inadequate. —2,506—

So we investigated the possibilities that this other type of machine which is known as a slip frequency converter, which does not rigidly tie the two systems together, but permits a transfer of power between the 25 and 60 cycle systems, at the same time allowing the same to slip, with respect to each other. 5804

It has one what might be called disadvantageous feature, really it isn't from our viewpoint, namely, that the time on the two systems cannot be controlled from the other. That is, if we have clocks on the 25-cycle system, you couldn't control them from your 60-cycle system because this slip frequency converter would allow the frequency to vary. So we have to control the time on each system independently. That is a difficulty.

These two converters, which were first installed in the Page Avenue station in 1929, also contain in the 60-cycle end 15,000-k. v. a. condensers each, or a total of 30,000, which are used to operate the Osage-Page Avenue circuit. In other words, they act as independent synchronous condensers would do, and thereby we were able to economize and avoid having to purchase separate condensers for operating the line which we would otherwise have had to do. And at the same time, we get the benefits of the conversion from 25 to 60 cycles, or from 60 to 25 cycles. 5805

5806 *Stanley Stokes—By Respondents—Direct*

Now these machines were put in, as I say, at the time when the load was growing most rapidly, toward the end of 1929, and were intended to operate in either direction, but primarily were expected to furnish Keokuk with 25 cycles additional reserve from our 60-cycle system. In other words,

—2,507—

it is much cheaper for us to generate at 60 cycles, and then put the current through these frequency changers whenever it is required, because we can use them in the reverse direc-
5807 tion as well, than it is for us to produce at 25-cycle generation.

The load at Keokuk had been growing rapidly, and these machines were supposed to give the additional assistance.

At about the time we completed the installation of these machines, the depression came on. With us it didn't really hit us until toward the end of 1930, because we were in the process of adding on the St. Joseph Lead Company load and certain other changes which carried our load on for almost a year after the break in 1929; but it ultimately got to us, that is, the depression, and the big industrial power cus-
5808 tomers at Keokuk reduced their operations, just quit.

During the years following that, in the depression, we would have lost a very large amount of water power which would have had to have gone over the dam and be wasted, for the simple reason that our night load and part of the time our day load would not have been sufficient to use it up at 25 cycles.

These machines, working backward from the most frequently contemplated method, that is supplying from the 25-cycle to the 60-cycle system, produced during that depres-

sion period a very large amount of energy; a total of 964,000,000 kilowatt hours of Keokuk power have been converted to 60 cycles, and 692,000,000 k. w. h. have been supplied to

—2,508—

the 25-cycle system from the 60-cycle generating facilities.

Q. During what period was that? A. Starting at the time they were installed, or shortly after, practically in 1930. They were installed in the latter part of 1929.

Calculating the earnings from this interchange over a 10-year period, we estimate that the machines have actually 5810
saved, for the Union Electric Group, more than $2,000,000, to say nothing of the value of the reserve capacity to the 25-cycle system.

I may say that that was a great deal more than we had expected when we installed them.

The result was that at the end of either 1937 or 1938—and if it is important, I can identify the date—we decided to put in an additional machine similar to the previous ones, but of somewhat larger size, due to a change in design and to include more what we call 60-cycle corrective capacity. It acts as about a 25,000 to 30,000 synchronous condenser, 5811
and will transfer 20,000 kilowatts either way in addition. That machine was installed and has operated beautifully. We had considerable difficulty with the others to begin with, due to mechanical breakage, but the new one is a very perfect device. Those machines represent one shaft with about seven independent units on it. It is, roughly speaking, 80-some-odd feet long, and would not go in this room. It has a 25-cycle generator, a 60-cycle generator, a unit known as a converter unit, a regulating unit, and an exciter, and

—2,509—

a high-speed exciter known as a pilot exciter—all mounted on one shaft.

It is a very interesting machine. I don't know that it has any particular bearing here, but it is indicative of the increasing cost to state that the machines in 1929 cost us $292,000 apiece, to purchase, and when the quotations on this machine were running up into very much higher figures, a quotation was requested on a duplicate of the 1929 machine. That was received, and it was $456,000. The
5813 actual price paid for this last machine was somewhat more than that because it was larger.

Along that same line, a recent inquiry was made as to what we could purchase one of the water wheels for the Osage hydro-electric plant for. They cost us $175,000 when purchased somewhere around 1932. The proposal was for $300,000, indicating the extent of price increase in some of the lines of this equipment.

The Page Avenue sub-station is an indication of what modernization can do in a plant. To begin with, it was
5814 designed to have a total capacity of 60,000 kilowatts, of 25-cycle power, and twelve 5,000-kilowatt single phase transformers. Each of those transformers was a huge device, much higher than this room, with tall bushings, and bushings made out of paper slips, the best they could do in those days. They were indoor transformers and couldn't be operated outside because nobody knew how to develop bushings that would stand the outside. —2,510—

In that same area, the same building, with some extension, we now have the 404,500 kilowatts of transformer

capacity which were referred to here, plus these frequency changers, plus a large size distribution station for outgoing regulated 2,300/4,000-volt circuit. The original transformers, of course, were removed from within the building, and we took the place of twelve 5,000 units with two 3-phase units out in the yard, which occupy some ten per cent. of the yard. Then the space which was made available in the building was changed around and a floor added, and a 60-cycle bus structure installed in the second floor, and additional structures in the first floor, and a little at a time it 5816
has become a modern power plant of today's vintage.

So that shows what the changes in the art have amounted to in that period of time.

Q. Have you any idea as to the amount of investment represented in that sub-station? A. I don't know whether I can approximate it or not, it is a figure that would be readily available, but I am not sure that I have it with me.

Q. Just leave that then for the time being. A. If it is important I will make a note, and get it. I don't like to guess at it at all. I can state what the last frequency changer job cost. That was $840,000, including the building, 5817
equipment, transformers, and so forth. The transformers that received the power from Osage, receiving terminal

equipment, cost $161,000 per bank, and relatively the total investment out there must represent—oh, I would estimate it roughly as three or three and a half million dollars, something on that order.

Q. Now what has been the record of the Union Electric Group with respect to its growth in generating capacity over a period of years? A. The load has grown, and the generat-

ing capacity has kept up with the load growth. We had 143,500 kilowatts in 1913, and that has grown to this figure of 722,500 kilowatts name plate rating with an effective dependable capacity of 630,000 kilowatts by 1940. The growth has been fairly steady and rather uniform. As a matter of fact, from 1911 about, to the World War, or even beyond, I would say from 1911 to 1924, our system load, when plotted on logarithmetic paper, has almost exactly followed a straight line for all of those years, and the slope represented
5819 doubling every seven years or thereabout. In other words, it doubled consistently about every seven years from 1911 to about 1924.

Then it started to increase there for a while a little more rapidly, and then came the depression. Since 1934, about, the rate of increase is again fairly uniform, part of which is accounted for by recovering load lost in the depression, and the rest of it is due to added load.

At the present time, the total system is growing at about

8 per cent. per annum, but we have to anticipate the possi-
5820 bility of almost a 10 per cent. growth a year for the next two or three years? It seems necessary to base our power plant program on such a possibility.

Q. 10 per cent. a year, you mean? A. For the next couple of years. By that I mean, to make the statement a little more exact, we have decided that in installing this equipment at Venice, and subsequent equipment, that for the period of the next two or three years we will set up a power plant program based on 10 per cent. system growth, but will calculate the economies of operating units on a basis of 8½ per cent. growth. What that means is simply this, that the possibility

of large chunks of National Defense load is so imminent that we have simply got to have a little more latitude in our construction program than we really expect for operating purposes.

So even though we are planning this program on a 10 per cent. basis, we don't feel quite justified in calculating the actual load itself on that basis, but we do need a little insurance, a little leeway.

There are two or three single loads being considered that we don't know to what extent they may grow. For example, 5822
we have no way of knowing whether this wind tunnel which the Government has been considering at various locations, and which is still being discussed—we have to consider the possibility that they may be located there; and we have to

—2,513—

observe the Curtiss-Wright situation where they can readily add 5,000 or maybe 10,000 kilowatts—and those two figures, together with the possible industry location here of 20,000, would themselves total 50,000 kilowatts right there in three items.

Now they may come all at once. The result is that there 5823
doesn't seem to be anything to do but to plan for it, and then slow down as soon as we have any knowledge of the facts.

The Examiner: Mr. Hamilton has another matter before the Commission that he wants to attend to at this hour, so we will recess until tomorrow morning at 10 o'clock.

(Whereupon, at 4:05 o'clock, p. m., the hearing was recessed until 10:00 o'clock, a. m., Tuesday, October 22, 1940.)

—2,514—

5824

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

5825

Hearing Room 1102-A,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Tuesday, October 22, 1940.

Met, pursuant to adjournment, at 10 o'clock a. m.

5826

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD and ARTHUR J. BUSWELL, Attorneys for the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Hamilton: Will you resume the stand, Mr. Stokes?

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

5828

Q. At the conclusion of the hearing yesterday, Mr. Stokes, I think you were in the process of describing the development in generating capacity of the Union Electric Group from 1913 on, and had given some figures in that respect. Will you continue your statement? A. I believe I stated that in 1913, we had a capacity of 143,500 kw. which, by 1940, had grown to 630,000 kw.

The process by which this growth took place is worth a little mention. In 1913 we had service from Keokuk and Ashley steam plant. By 1920, this service, which was originally 143,500 kw., had grown to 160,000. That was primarily 5829 due to the addition of a 20,000 kw. unit at the Ashley Street station, together with certain other withdrawals as the boilers and units began to get old.

By 1925, the total had become 284,000. This large increase started in 1923, with the addition of the Cahokia station, whose first section was built in that year.

—2,516—

In 1924, there was an addition of a 35,000 kw. unit at Cahokia, and another one in 1925. The figure again increased from 1925 to 1930, from the 284,000 to 435,000 kw. That was

the result of several changes, including the acquisition of the Rivermines plant.

Now in addition to that, there was an addition to the Cahokia plant in 1927 of 50,000 kw.

Referring to the previous statement of capacity of 435,000 in 1930, in the following year, 1931, this changed to 550,000 due to the addition of the Osage hydro-electric project.

Coming up to 1938, we increased the rating of the Osage project by 15,000 kw. This change was not a change in the
5831 physical property at Osage, but a change in the size of the system load with resultant effect on the duration curve, which permitted Osage to increase its annual peak cut-off by that amount. This was in accordance with the original plant at the time the plant was built, in which we first rated combined hydro at 185,000, then at 200,000, and ultimately at 225,000, above which it will not be carried.

It of course must be understood that as these ratings for peak output are increased, the hours of use have to be correspondingly reduced, because the total k. w. h. is practically a constant.

5832 By the year 1940 we had attained a total of 630,000 due to a combination of minor changes, removal of a 5,000 kw. unit from the Alton steam plant, and an increase of boiler

capacity at Ashley Street.

That is about the history, roughly, of the development.

Q. Now I think it would clarify matters somewhat at this point, if you would state the year of installation of each of the units in each plant, and at the same time indicate the capacity of each unit, and the voltage at which current is generated, and any other information which seems to you

appropriate. A. The first plant to be described is Cahokia. The units in these power plants are given numbers. When I say No. 1, that is the number by which that unit is referenced.

Unit No. 1 is a 75,000 kw. unit, installed in 1929. It has a power factor of .9. All of the Cahokia units are of the same voltage, 13,800 volts, and the frequency is 60 cycles. No 25 cycle equipment is located at Cahokia.

Unit No. 2 is rated at 30,000 kw., has a power factor of 85 per cent. In expressing power factor, it is proper to say either 85 per cent. or .85, either is all right in this case. The 5834
year of installation was 1923.

No. 3 unit—35,000 kilowatts; the same frequency and voltage as previously stated, and .95 per cent. power factor, installed in 1924.

Unit No. 4—35,000 kilowatts; power factor .855; installed in 1925. —2,518—

Unit No. 5—50,000 kilowatts; power factor .9; installed in 1927.

And the last unit, No. 6—75,000 kilowatts; power factor .8; installed in 1937.

Now I should explain at this point why Unit No. 1 hap- 5835
pens to come in there in 1929, while No. 2 was installed in 1923. Unit No. 1 was installed in place of an original unit No. 1, a 30,000 or 35,000 kilowatt turbine, which was removed and installed in a plant at Venice, the new turbine setting on the same foundation as the old one, with some additions to it.

It was found possible, by moderate changes in the foundation, and miscellaneous building equipment, to accommodate a 75,000 kw. turbine in the location and with the facilities originally provided for a 35,000 unit. It of course required

a new condenser, new pumps, and increased capacity of boilers.

At about that time a better method of arranging the furnace walls in boilers had been discovered, and due to this improvement it was possible to get more capacity out of the boilers by a moderate rebuilding program. Naturally, this served to reduce our unit costs to obtain 75,000 kilowatts, whereas previously we had only had 35,000.

Q. Now in the case of Cahokia, the aggregate name-plate
5837 rating is the same as the aggregate dependable capacity? A. That is right, that is an unusual condition, where you can

rate your plant in total for practically all requirements equal to its combined name-plate rating.

We are not quite certain of our ground to go any higher than that, but we have reasonable assurance that we can increase that rating slightly in the wintertime, and we are not quite certain yet, because of lack of experience with the last installation, as to what the limitations are. I personally feel that the turbines in that plant could probably be driven
5838 to considerably above 300,000 in cold weather, when the condensing water is cold, but I do know that the boiler limitations at present would not permit that.

We are installing some thermo-couples and other measuring equipment to try to learn as much about the actual capacity of this equipment as we can. That, of course, gets back to a matter of rating equipment, and a manufacturer can only state one set of conditions at which his machine will operate when he puts a name plate on it, and that is the set of conditions for which the machine is designed. In actual

practice, there are many other sets of combinations of circumstances which may cause that capacity to be either higher or lower than its name-plate rating, and when you come to a large system, that is a matter of considerable consequence.

The system power factor as a whole is approximately .9, at times of peak load, and goes down to a considerably lower figure at light load periods. We have, however, in recent

years, installed a very large number of capacitors on our distribution system, which, a little at a time, are improving 5840 the power factor.

The application of synchronous motors, by a good many of the industrials, and particularly in connection with some air-conditioning work, where large units are being installed —those synchronous motors are of material assistance in power factor improvement.

In general, we have a rather satisfactory power factor situation at St. Louis.

Now, taking up the next plant, the Ashley Street plant, which has been previously discussed, its Unit No. 1, rated at 10,200 kilowatts, 60 cycles, .8 power factor, was installed in 5841 1921. The voltage of that unit is 4,500 volts, and it is used to feed directly into the distribution system for general purpose use.

Unit No. 3 (Unit No. 2 having been removed at some point, or the numbers changed and no longer exists)—12,000 kilowatts; 6,600 volts; 25 cycle. This is a unity power factor generator installed in 1910.

Unit No. 4, and Unit No. 5, are duplicates, installed in 1910 and 1911, No. 5 being in the latter year. Those machines are operated in conjunction with our 25 cycle power received

from Keokuk. The major use of this power is for the supply of the railway load (street cars), in the city, and also to

—2,521—

supply our so-called Edison sub-stations, which convert the 25 cycles to direct current.

No. 7 machine, a 20,000 kilowatt machine, 4,500 volt turbine, at 60 cycles, has a power factor of .8, and was installed in 1917.

No. 6, which I passed over, was a 12,000 kilowatt machine,
5843 4,500 volts, 60 cycles, unity power factor, installed in 1910.

Those two machines operate with No. 1 to supply normal distribution requirements on our radial system.

Q. At what voltage? A. 4,500 volts. That is No. 1, No. 6 and No. 7.

No. 8 is a 20,000 kw. turbine, at 6,600 volts, 25 cycles. This machine has a power factor of .9, and was installed in 1920. It operates with Nos. 3, 4 and 5, previously described, and in the same manner.

Q. And at the same voltage? A. And at the same volt-
5844 age.

No. 9 is a 20,000 kw. turbine, at 13,200 volts, 60 cycles, and a .8 power factor, installed in 1920.

This completes the individual machines in Ashley Street.

Q. Now summarize, if you will, for Ashley Street, the name-plate rating and dependable capacity? A. That totals 98,000 kilowatts of name-plate total capacity. The dependable rating is 65,000. That is limited by boiler capacity. A turbine is constantly kept in repair and rebladed, and can

—2,522—

be maintained in its original operating condition, as far as

satisfactory, reliable service is concerned. Boilers cannot. Boiler tubes can be replaced, but the time comes when the boiler setting, bracing, and other features, have depreciated to the point at which the steam pressure has to be lowered, and hence those boilers have to be removed and the turbine is still good.

So that the capacity of the boilers has declined to the point at which we rate the plant at 65,000. Among those boilers, however, are two new 300,000 pound per hour units, which are now being installed and will be ready for operation this winter. The plant supplies, in addition to its electric requirements, some steam heating load, which will be discussed more in detail later, and that accounts for the installation of these boilers to a large extent, that and the most attractive location of this whole plant in the center of the city, which makes it very suitable for reserve operation. 5846

The next plant to be described is Venice. It has three units.

No. 1—20,000 kilowatts; 13,200 volts; 60 cycles; 95 per cent. power factor, installed in 1924.

No. 2—35,000 kw.; 13,800 volts; 60 cycles; and 95 per cent. power factor, installed in 1929. That is the unit which was removed from Cahokia, as described previously. 5847

No. 3—7,500 kw.; 2,300 volts; 60 cycles; and .95 power

—2,523—

factor; put in in 1919. This last unit is a very reliable little turbine, and is particularly useful as a secondary source of power supply for the auxiliaries in the event of failure of the main source. It also can be used on peak to add its increment to the total.

5848 *Stanley Stokes—By Respondents—Direct*

Q. Now in each case, if you will, will you summarize for each plant the dependable rating and the name-plate rating? A. The total name-plate rating of that plant is 62,500 kw., and it again is limited to 40,000 kilowatts by boiler capacity.

At this point I should like to make a little explanation of this plant. The 20,000 kw. unit is a modern type turbine designed for 350 pounds pressure at about 750 degrees. There are two very high-grade, relatively new boilers in the plant. We will, at some day, add boiler capacity to bring
5849 this turbine up to its full pressure. At the present time it is operating at reduced pressure. But the size of the net gain in capacity is so small that at the present time we have decided to give precedence to the construction of a new and larger plant, and let this go until it seems to be the most economic time to install it. Along with it, we contemplate the possibility of adding an additional wheel at the Osage plant. Those two, working together, will add about 35,000 kw. to our system capacity, and this will undoubtedly be an economical move at some future date.

—2,524—

5850 The next plant is Rivermines. It has two units installed; One, No. 4, the first one, 12,500 kw.; 7,200 volts; 60 cycles; and .8 power factor; installed in 1923.

No. 5—12,500 kw.; 7,200 volts; 60 cycles; 80 per cent. power factor; installed in 1925.

These units are in first-class operating condition. They haven't received a great deal of hard use, and we have recently spent considerable money on the boiler plant and consider that plant, which totals 25,000 kw. for the two units, to be a thoroughly reliable, quick-starting, satisfac-

tory reserve plant to be brought into operation whenever required.

It has, for several years, been carried as what we call cold stand-by, that is, shut down, ready to start, but not running. It has, however, been run some this fall.

The dependable capacity is also 25,000.

I might summarize the combined steam plants there, which total, in name-plate rating,—485,000 kilowatts; with a dependable capacity of 430,000.

5852

I might as well go right ahead and describe the Keokuk plant. It contains units numbered 1 to 15, inclusive, 15 units in total, each of 7,200 kilowatts; 11,000 volts; 25 cycle; and .8 power factor; installed in 1913. That makes a total installed capacity, name-plate rating, of 108,000 kilowatts.

Before discussing the dependable capacity, I want to describe the Osage plant. —2,525—

It contains units numbers 1 to 6, inclusive, 6 units in total, of 21,500 kilowatts each; 13,800 volts; 60 cycles; and .8 power factor; installed in 1931. Those turbines have a 5853 dual rating at either 21,500, or 26,000 or 27,000, depending on the temperature. It is what is known as Class B, or Grade B insulation, mica, and 80 degree Centigrade operation will not deteriorate it.

The combined name-plate rating of those two plants is 237,000 kilowatts.

I could put in a statement as to the maximum output we have obtained from them, which I believe has been 160,000 out of Osage on a short-time peak, and 135,000 from Keokuk, but the two, taken together, are given a dependable rating

of 200,000 kilowatts for annual peak for cut-off purposes. This has been mentioned to some extent previously, and in the discussion which may follow on operations, I would like to mention it again.

The rating of a combined group of hydro plants, one of which operates on stream-flow, and takes the run-of-river, and the other which operates on a storage basis, can be given almost as many ratings as one wants to. Each rating depends entirely upon the purpose for which the plant is to be
5855 used, the time of the year, and the length of time for which it is to be run. It is a very difficult thing to rate that type of a plant. —2526—

Q. Now state, if you will, the aggregate book value of the electric generating facilities of the group? A. The total investment in these plants at the end of 1939 is approximately $103,400,000, as taken from the company's books. The division of that investment is: Ashley Street—$10,700,000; Cahokia—$32,100,000; Venice—$5,100,000; Rivermines—$2,900,000; Osage—$31,500,000; Keokuk—$21,100,000.

5856 Now these figures are the net investment in power plant facilities only for electric purposes, and do not include any transformers, substations, or other equipment which is actually contained even within the plant. It is a specific designation up to and including the buses. Those figures may be increased by a large percentage when all other factors are included. As a rough example, I think that the Cahokia figure of $32,100,000 would, if the sub-stations and other equipment in the yard were to be included, amount to somewhere between $37,000,000 and $38,000,000. Likewise for the other plants.

The development of the electric light industry in St. Louis was quite early. I don't know the circumstances which brought it about, but I do know that the only cities that were mentioned as having electrical facilities in 1890, in the 1890 Census, were St. Louis and New York. The first plant in St. Louis was an arc-light machine, imported by a famous restaurateur, Tony Faust. He had a rather famous restaurant for many years in the early days. That machine was brought over from Paris by him in 1878, and in the

—2,527— 5858

ensuing 20 years there were a number of so-called systems installed in St. Louis, and the art developed very rapidly.

I would like to give this little connection with these other plants to illustrate, along with the growth of the load and the installation of these various units, a little background to go with it.

By 1898, one of our predecessors, the Missouri Edison Electric Company, could claim such outstanding achievements as the operation of alternating generators in parallel, the use of induction type feeder regulators, the distribution of power by an AC network, and the operation of the world's 5859 largest AC arc-light station. The company had a load factor of 20 per cent., as compared with our 60 per cent. load factor of today.

The discussion and mention of all of the different systems entering into the present Union Electric Company of Missouri, is a very interesting chapter, and contains a long list of names of companies, which I will not attempt to detail at this point.

The Union Electric Light & Power Company was organized in 1902, and had three power stations, A and B, and

Ashley Street. One of those stations, Station B, is now used as a storeroom, and the old foundations of the old Edison machines can still be seen back in one of the buildings.

—2,528—

Station A has completely disappeared as far as any equipment is concerned, and with all of the later acquisitions and consolidations, the company has now become the present Union Electric Company of Missouri.

I should at this point mention the new plant which is
5861 now under construction on the Venice site. It will have two 40,000 kilowatt units initially, and will be designed for an ultimate of 400,000 kilowatts.

Q. And those two units which you have just referred to, are in addition to the references to the capacity of the Venice plant previously mentioned? A. Yes. We will distinguish those Venice plants by referring to the present existing plant as Venice Plant No. 1, and the new plant which is now under construction as Venice Plant No. 2.

Q. I don't think you mentioned, Mr. Stokes, the Cupples generating station. Do you want to refer to that very
5862 briefly? A. The Cupples Station is a very small plant which our people in the engineering department neglect entirely in our consideration of the plant as a whole. We have a steam-heating connection to what is known as the Cupples block, it is a block of buildings in the downtown area of St. Louis, owned by Washington University, and we supply steam to heat some of those buildings, and that steam is taken from our regular steam mains, and because the machinery was already available, and because they needed some method

of reducing the steam pressure down to the heating pressure, it is put through a small 420 kw. generator and runs when the steam-heating season is in operation. It would have no effect on our system capacity. The energy which may be generated by this little machine is fed back into the Union Electric Group system.

Q. Now are these generating plants interconnected? A. They are, they are interconnected with both cables and overhead lines of considerable capacity.

The interconnection between these plants has been made 5864
more than ordinarily heavy. By that, I mean that the size of wire, such as 300,000 circular mil conductors, and voltages of from 33 to 66 thousand volts, with short distances, permit the transfer of rather large blocks of power between plants.

The necessity for such high capacity provisions is primarily brought about by the desirability of obtaining power from the hydro plants and distributing it to any point in the system, and particularly to be able to get it to the major steam plants. When the hydro system has its maximum capacity, the steam plants have to stand by, and when it is
at the lowest point, they have to run at capacity. 5865

Having provided this interchange of capacity between plants, it has many other useful purposes. It acts to supply reserve from one plant to another, as the result of the sudden loss of a unit; it permits the Osage plant to pick up loads

quickly in emergencies, which can not be done by a steam plant. The reservoir at Osage is at all times able to handle more load than is usually being carried by the plant, and for

periods of a few days to ten weeks, this plant can act as what is termed spinning reserve.

—2,531—

We have even gone so far as to provide some automatic equipment to permit the generators at Osage, or at least two or three of them, to be motored, that is to operate as a motor, being driven from the rest of the system, and we open the gates and let through just enough water to keep the bearings cool and keep the machines operating properly, and also meet
5867 the Government requirements of minimum stream flow.

Under these conditions those wheels can come up from carrying practically no loads to full loads, in a matter of theoretically almost seconds, actually we don't depend on them under about two to three minutes total, but they have actually functioned in less time. Now that type of reserve is very convenient.

In addition to that, the capacity of the various transmission lines permits the diversion of power from one part of the system to another. Our main transmission lines are of very modern construction and in a number of cases are com-
5868 pletely equipped with load ratio control transformers. These will be described a little more later but they permit changing the ratio of transformation while under load, without the necessity of taking the transformer off to do it. This sort of a device is expensive. We have just included one on each of the four transformers being purchased for the new Venice plant, at an additional cost for the four of around $160,000. That is for the facilities alone. That does not include the transformer.

—2,532—

An example of the use of such a transmission system in providing reserve is, I think, of interest. On May 13th, 14th and 15th of this year, we had a situation exist in the Mississippi River which had never occurred before, and we have had plants operating on the river, as indicated here, all the way back to 1902.

At the time we didn't know what was going on, but all of a sudden leaves and trash, and debris of all kinds just came down in a flood, started without any notice, and stopped up the condensers. We have the latest type of 5870
rotating screens to prevent debris of any kind from getting into the condensers. These are so-called travelling screens that act like a chain belt, going over a roller and down into the water and back up again, and the water flows through this screen, and as the screen reverses at the top and starts down there is a spray of water to wash it off clean.

These leaves and trash came in, in such a volume that they went right over the screen, and the stream of water couldn't wash it off the back side and they got on the other side of the screen and into the condensers. And without any particular warning, unit No. 5 had to be shut down 5871
twice on May 13th. On May 14th, unit No. 5, that is a 50,000-kw. unit, had to be shut down——

Q. (Interposing) At what plant is this? A. Cahokia—that had to be shut down three times; and on May 14th, unit

No. 6, a 75,000-kilowatt unit, had to be shut down twice.

On May 14th, unit No. 3 had to be shut down twice.

On May 14th, unit No. 4 went down twice.

On May 15th, unit No. 4 was down once.

On May 15th, unit No. 6 had to be again taken down.

Each time, to clean the leaves and trash out of the condensers. Now that is a pretty severe situation when you realize that 75,000 and 50,000 and 30,000 kw. units were going down fast. Each shutdown was for a period from two to two and a half hours minimum, in which the condensers could be cleaned and the capacity of the remaining units was reduced by the gradual impeding of the flow of water
5873 through the remaining units. During this entire period of disturbance it was possible to pick up the load at other plants through the transmission system without any outages whatever to customers.

The Osage plant functioned beautifully during this particular period. So that the investment in these tie lines as we call them, which is justified as a necessary expense of transferring hydro power, has an extremely important part in the general operation of the system, as well, and serves for reserves, transfer of loads, reduction in standby operating expenses. If we didn't have these circuits as extensively as we have, we would have to operate more machinery
5874 in the older plants for reserve purposes.

—2,534—

Q. Would you say then that the fact of the interconnection of these generating stations results in economies of operation? A. It does, that is the tie lines naturally provide certain increased fixed charges which exist, and which would not exist if we didn't have them, but the other side of the story is that they serve to make a general overall economy for the system and are, in addition to that, a major source

of safety to the operation. If the economy in the operation of these circuits merely balanced the fixed charges, we would have an insurance factor for service that could not be overlooked.

Q. Is it, or is it not a fact that power from any of the generating stations can be made available to any part of the electric service area of the Union Electric Group by means of the transmission line connections? A. It can, to the extent that the capacity of the lines permit, and that is a considerable portion of the total. For example, the 5876
three circuits which are normally in daily use from Osage can each transfer approximately 50,000 kilowatts. The tie lines between Cahokia and Venice can each, at the same time, handle 50,000 kilowatts or transfer 100,000 kw. between Cahokia and Venice.

Similarly, between Venice and Page Avenue, we can transfer 100,000 kw. at 60 cycles, and in addition to that have a large number of 13,800-volt cables which can transfer about 35,000 or 40,000 kilowatts Ashley to Page at 25 cycles at the same time.

—2,535— 5877

The net effect of this thing is this, that we can transfer all of the load which we care to transfer. If we were to transfer all the load of one major plant into another major plant area, we would sacrifice the reliability of service because if that connection were to be interrupted for any reason, it would be difficult to pick up that large block of load on any remaining plant.

And consequently, we would, for other reasons, limit the amount of transfer of load from one load area into another

as a matter of system reliability, even if we did have more facilities than we now do. That point has been brought out repeatedly in connection with system reliability and system disasters, that there comes a point at which economy can properly be sacrificed for safety in operation.

On our system, 100,000 kilowatts is, in my opinion, the upper limit at which we should transfer loads between load areas unless we are actually standing by with excessive capacity in each area; in other words, that latter statement
5879 means that there wouldn't be any economy in operating that way, it would be a matter of rather a temporary nature.

The best summary I can make on the thing is that the operation of these lines does result in major economy to our system and that we would have to put them back in again if they were not there.

—2,536—

Q. Referring to Respondents' Exhibit No. 51, which is the system map, is it or is it not correct to say that power generated at Keokuk could be made available to the service area shown around the Osage hydro-electric project, by means of
5880 a transmission line? A. It could very readily and may do so. Keokuk, although it is 25-cycle generation, delivers its power through 60,000 kilowatts of frequency changers on to the Page Avenue sub-station, 60-cycle bus. The Osage hydro-electric transmission circuits terminate on this bus, so that Keokuk not only could deliver that power out to the Lakeside Light & Power Company, but it wouldn't know it was doing it. The load out there is relatively small.

Q. And the converse might also be true, that power generated at Osage might be made available to the service area in and around Keokuk? A. It not only can, but it is. That

is, at times when we have occasion to supply power to Keokuk, we may take it either from steam generation or from the Osage plant. We must keep in mind at all times in this connection, that Osage is a storage plant and Keokuk a stream-flow plant, and that there may be power available at Osage when there isn't similar power available at Keokuk in excess amount.

The facilities for transferring power are fully adequate. We have anticipated a system of different totals, starting with 500,000 kilowatts peak load, and carrying it on up to 5882
1,000,000 kilowatts for the ultimate future, and the prob-

ability is that we will not require more than two addition lines to take care of the situation for many years in the future.

One of those will be an additional cable between Page Avenue and Venice, and another may be an additional tie line between Venice and Cahokia, as the Venice plant becomes very greatly increased in the future. And with those two circuits, we feel that we will be able to handle the system load of double its present magnitude, the reason being that 5883
the amount that we would want to transfer from one area to another is roughly limited to 100,000 kilowatts, and we will have that amount available in transmission capacity.

Q. I asked you yesterday if you could state the approximate investment in the Page Avenue sub-station, and you were somewhat in doubt as to the amount. Can you now state the amount of that investment? A. I believe that I hazarded a guess that it would run on the order of magnitude of three and a half to four million. The actual figure is, I

believe, available. The station has a present investment, as of the end of 1939, of four and a half million dollars. It was originally built in 1913 at a cost of $710,000. The modernization of this station, and constant change to keep up with the art and with the requirements of the system, has been very interesting to me, and is really only equalled, in my opinion, by some of the changes that took place at Ashley Street

—2,538—

where, in the early days, they had steam engines, they re-
5885 moved them and put bigger units on the foundations and then they installed 5,000-kilowatt vertical turbines, and due to the improvement in the art those 5,000-kilowatt turbines were replaced by 12,000-kilowatt turbines in the same space and on the same foundations. Then the big triple expansion cross compound engines, which were the glory of the power industry at the St. Louis World's Fair, were then cut up with a blow torch and removed, and 60,000 kilowatts in turbines were put in, in the place of two of those. I believe they were originally 4,000 kilowatts each, engines, but they were beautiful pieces of machinery.

5886 That Page Avenue job has been analyzed by various engineers as a good example of the changes in the art.

To start with, we had to have a cooling basin for the transformers. Now that basin is as big as two ordinary swimming pools, such as you have at a country club, and cost a lot of money, and they have to pump the water from that basin a distance of about 800 or 900 feet with large pumps and circulate it through all the banks of transformers, and then the water scales up the cooling coils in the transformers, and then the transformers got too hot, and then the coils corroded and leaked, and the transformers failed. Today that

is all done away with, and we have what are known as combination self-cooled and air-blast transformers. These transformers, for example, will have a rating of 37,500 kilowatts,

—2,539—

self cooled. That means that the radiators are just exposed to the air in the normal manner, with no blast of air directed on them. Then, by turning on blowers, we can increase that capacity to 50,000 k. v. a. This feature, which is a relatively recent application, is particularly applicable for reserve. I 5888
mean, if you have two transformers, or say better three, whose rating is 100 kilowatts each, and whose maximum rating is one-third more than that, then if you have lost one you can turn the blowers on the other two and still get your full rating. It is a relatively cheap form of reserve, and very convenient. Those blowers go on automatically in case the transformer temperature goes above a certain amount.

Q. Will you now describe the practice of the Union Electric Group with respect to maintaining reserve capacity? A. The reserve capacity required for a system is determined by a large combination of circumstances and is not a rigid 5889
thing that can be laid down by some one person and be sure that that decision is the only correct one.

I will illustrate this. If a system has the largest unit, a 25,000-kilowatt turbine, it would not ordinarily require as much reserve as if the largest unit were a 100,000-kilowatt turbine. That is perfectly obvious, because if you lose 100,000 at one time, you would have to have more standby reserve. On the other hand, if you tried to carry a 500,000-kilowatt system peak with 25,000-kilowatt units, you wouldn't

—2,540—

worry, by that time, about losing one of them; you would have so many of them down for overhaul at one time, due to regular maintenance schedules, that you would finally come back up again and require a large amount of reserve.

So that the answer is this, the amount of reserve required first is a function of the amount of insurance that you feel can be justified against losing any load. Secondly, it is related to the size of the largest unit on the system. Third, it is again related to the number of those large units on the
5891 system. Fourth, it is directly affected by your schedule for overhaul and repair of the large units.

For example, we have a schedule requiring the complete inspection and overhaul of all of our main power turbines once every two years. Now perhaps some people might consider that to be too rigid a schedule, and would be willing to let them go for three years. If you extend your overhaul schedule and inspection to every three years, instead of every two, the probabilities that you will have trouble on your peak load are far greater than if you inspect them every two years. Consequently, if you get three 80,000-kilowatt
5892 turbines, or four, which we have in prospect, on a system, and overhaul every two years, you are going to have two of those down in a given year, and if it takes about five weeks to thoroughly overhaul a 80,000-kw. unit, then you have got 160,000 kw. down during the same year, or you have got

about 10 weeks total in which 80,000 is out of service.

Not only that, but you have got to fit in the overhaul schedule on your remaining smaller units.

To illustrate what we really do, I will use some figures. We have an anticipated winter peak this winter of about 515,000 kw. We have at the present time 630,000 kw. of effective dependable capacity. That would appear, on the face of it, to have only about 115,000 kilowatts of reserve.

In addition to this, we have excess or dump power contracts that permit us to drop that load anytime the water power is low. It is sold at a cheaper rate and available only when the water power is high. So that gives us from 15,000 to 30,000 kilowatts leeway. That load is a variable quantity. 5894
In addition to that, we have another 5,000 kilowatts of 60-cycle reserve contracts, which, on notice, can be dropped in the event we have any trouble on the system. We will add those up, and that gives us an approximate figure today of between 135,000 and 140,000 kilowatts of reserve, over and above the depreciated rating of our plants, that is the 722,000-kilowatt name-plate rating, which we have reduced arbitrarily to 630,000 kilowatts of dependable capacity, and then below that we have from 135,000 to 145,000 kilowatts of reserve, and then our load.

Now we don't consider that we need that much reserve, 5895
but we are willing to agree that 125,000 kilowatts is probably

as good a figure as we can select at the present time.

If we get three large turbines such as 80,000 kilowatts, then we would raise our reserve requirement to 160,000. So that the water power situation enters heavily into these factors and permits us to take two of these big turbines out for overhaul, always during the spring high water period, and that makes it possible to overhaul the smaller units in the

valley of the fall load, which always occurs in our case after the hot weather.

I want to make clear that where I said that the figure of capacity had been depreciated to 630,000, that refers to our difference between the name-plate rating and the dependable rating.

Q. Now how much of this reserve figure of 125,000 kw. is spinning reserve? A. Spinning reserve is usually taken to mean the amount of equipment in actual operation, over and
5897 above the load requirements. We require that the largest unit on the system be kept spinning at all times, or its equivalent, in our case 75,000 kilowatts. That alone is not sufficient to guarantee continuity of service, but we have got to go further and assure ourselves that we not only have that spinning reserve, but that it is available to all parts of the system, and that no bottle-neck or break may occur and prevent that being delivered to the point at which it is required. That is where our transmission interconnections come into

5898 play.

(At this point, a discussion was had outside of the record.)

The Witness: The matter of system governing is of great consequence to an electrical system, and becomes more important if interconnections with other companies are made. If a system is operating by itself, good speed regulation is also important, but when it comes to operate with any other system, it becomes imperative that perfect control be made avail-

able. We have a man in our organization who has been interested in governors for the last 15 or 20 years, and has become so proficient in his understanding of these devices that it has become more or less of a hobby with him, and when we were installing the Osage project, we developed some test equipment, and in working with the manufacturer, were able to show that his governors were not all they ought to be, and he recognized that fact and went to work on improvement of design. 5900

The steam-turbine manufacturers have always felt that the utility engineers were always demanding a refinement that was not justified, and that they, the manufacturers, were really building as good equipment as was required. That attitude we thought was unwarranted, and our views were concurred in by others, and a little at a time the attitude of the manufacturers toward governing has completely reversed itself over 12 or 15 years ago.

Permit me to explain that in the early days, out west for example, where we have the best case in point, 5901

the most efficient way to operate a hydro plant is to do what they call set it on the block, fix it to operate at the load for which it was designed, and let it stay there. Now, there is the most efficient way; you get the most out of that water wheel. But unfortunately, someone has got to govern the system somewhere. Whenever you govern a system you have to take the load fluctuations on that machine. Suppose that in

our case we had a 500,000-kilowatt system load, and that in order to govern that load and keep the load constant on all machines but one, we try to govern the whole system with one machine. That machine would take a constant variation from 30,000 to 50,000 kilowatts, just varying every second, and it would be too hard on the machine. That was attempted and very sensitive governors were put on one or two turbines, and failed because the variations in the load on those
5903 turbines were too rapid and too extensive, and they were removed, and the manufacturer said: "I told you so; you don't need these sensitive governors." Well, the trouble was that we did not have them on a big enough percentage of the whole system. If we could get sensitive governors on every wheel or turbine on a system, when the load goes off at noon, everybody quits, and the load drops for an hour suddenly,—if every turbine generator on the system were to vary in the same percentage, let's assume a 10 per cent. drop in system load or 50,000 kilowatts—if every machine
5904 on the system were to divide that drop in load in pro-

portion to its size, the size of the machine, a 5,000-kilowatt machine would only drop 500, a 7,500-kilowatt machine would only drop 750, and all the machines on the system would still be operating very close to their economical point. On the other hand, if you drop that sudden change in load on one or two machines, it would either overload the turbines so that they could not be operated, or they would go

down to such light loads that they are inefficient and may even get to the point where they cause trouble by over-heating. A large turbine will not run at no load, it will over-heat due to the way the steam operates, and may burn out blading.

Now then, the result of this is that Mr. Davis, the name of this gentleman, has prepared a number of papers, and one a rather comprehensive one, only last year. All of these things have taken place together. We have shown our problems, other companies have 5906
shown theirs. The manufacturers are now all in agreement in developing some very sensitive governors, and we are getting one of the very latest on these new turbines at Venice.

In fact, we have gone a step farther and are providing those turbines with dual governors, one of normal sensitivity and one a small head of super-sensitive design. The results of good governing have been checked on our system enough to show that there is actual economy in the use of fuel by not having the

—2,547— 5907

load constantly fluctuate away from the efficient point of the machine, and that money can really be saved by keeping the frequency where it should be.

Now I believe that I am very modest in saying that our company, through the efforts of this gentleman, has contributed a fair share in the development of this improved governor. We wrote specifications for governors three years ago, and were unable to obtain them; had to give it up. This year we went back with those same specifications in principle and

are successful in obtaining them. Not only could they be obtained from one manufacturer, but we could have obtained them from all three of the big turbine builders. That, in itself, will permit better operation on these large systems, and better service to the public with lesser cost.

Q. Now will you state whether it is the practice of the Union Electric Group to provide additional generating
5909 capacity in advance of actual need? A. Well, let us answer that question in this manner. We never spend money to get turbines to carry load because we are always carrying the load; we spend our money to obtain turbines to take the place of the reduction in reserve. Consequently, if we keep the reserve at least 125,000 kilowatts in advance of the load, we have to keep adding the turbines to keep up with the procession. The difficulty arises in the amount of time required to obtain the equipment and build a plant. I would like to illustrate that. In 1937 we had an unusual

5910 rapid rate of growth, load growth, during the year, up to the 13th of August, whereupon, not only on our system but throughout the country there was a sudden drop in load, and we lost about 100,000 kilowatts within the next three months, below that peak.

Now, just before that peak, if you had taken into account the rate of load growth, you would have anticipated that you should have purchased and installed within a reasonable length of time another 80,000-kilowatt unit. It takes a minimum, under normal conditions, of 18 months to get

one of these units and get it installed, and under the conditions, as they exist today, we are being told that if we want to get capacity in operation for the winter of 1942, or possibly the spring of 1943, that the order must be placed within a matter of the next two or three months at the latest.

Now then, you see my point, that we are unable to state definitely that the load will be here and that we will need the turbine, and yet we cannot afford to assume that it won't be required, and hence we have to place orders for this machine, firm orders, and pay for it, without any protection as to what the business conditions may be, and it requires considerable courage on the part of utility companies to make those huge investments. These units at Venice, this first section is estimated to cost $11,500,000. That is usually high because there are a lot of other things to be done, and that cost will get less later, unit cost, as the

5912

—2,549—

plant is expanded.

But nevertheless we have to make these investments and commitments two years ahead of what we know may be required, and yet that is demanded as a matter of protection to the public in the event that they need the power.

5913

The Examiner: Let us take a recess of five minutes.

(Whereupon, a short recess is taken, after which the hearing is resumed.)

The Examiner: The hearing will resume.

By Mr. Hamilton:

Q. I believe you stated the anticipated peak load for 1940. Will you state now the peak load actually experi-

enced for 1939 and 1940? A. The 1939 winter peak was 478,000 kilowatts on December 12th. This season's summer peak, July 9th, was 491,050 kilowatts.

By relating the winter peak to previous winter peaks, and by relating this summer peak of 491,000 to previous summer peaks, we conclude that the probable winter peak for this winter will be between 515,000 and 520,000. We state it as 515,000.

5915 Because I may some of the time refer to a load estimate with a winter peak for this winter estimated at 500,000 kilowatts, I want to again state clearly the distinction between the two figures which appear to be different and applies to the same thing.

—2,550—

In the operation of our power plant equipment, and in the calculation of the reserve, this 125,000-kilowatt figure which we have been using, this reserve, is based on the assumption that no dump-power load or 60-cycle reserve load will be carried unless we want to. That is the basis of those contracts. Consequently, our winter peak for this
5916 winter includes both the excess for dump power and these other contracts. The possible rate of growth for the next two years is one of the most difficult things to predict that we have ever had.

In the years from 1911 on, for many years we were able to predict the load with a degree of accuracy, but right at this moment we have one inquiry for a 20,000-kilowatt possible single load; another inquiry for a Government application of 20,000 kilowatts; and actual increase already agreed upon in an aircraft plant but the amount of the load

is variously estimated as being from 5,000 to 10,000, or maybe twice that amount, kilowatts. In other words, the rate of change is rapid in this National Defense program, and no one knows just what is going to be done.

Consequently, we have to play a little more safer for the next two years than would ordinarily be the case, and whereas, as I have stated previously, we have a building construction program planned on a 10 per cent. per annum rate for the two years——

Q. (Interposing) That is rate of increase in load? A. 5918
—2,551—
Yes, rate of increase per year. —Carried on for only two years, we know that that can not keep up for ever; but we really confidently expect that the actual load on that equipment will not exceed 8½ per cent. growth per year compounded each year over the preceding year.

Now what I mean is that because of the magnitude of single loads which may be conceivably dropped onto our system without warning, that we have got to have a little more latitude for the next couple of years than is ordinarily 5919
required. We simply cannot estimate load growth with accuracy.

Q. Now in order to get an idea of the relative contributions of each of these generating plants to your total group output, are you able to state for the year 1939 the gross generation in kilowatt hours of each of the generating stations you have referred to? A. Yes, I can state the gross generation of each of the stations.

Osage hydro-electric plant—235,850,700 k. w. h.—all these figures are in kilowatt hours; Keokuk—756,662,500; that

5920 *Stanley Stokes—By Respondents—Direct*

making a combined total for the hydro system of 992,513,200. The steam system: Ashley Street generated 14,003,025; Rivermines—nothing—(this is for the year ending 12-31-39, I believe that has been made clear)—Cahokia—1,553,376,000; Venice—39,331,000; Cupples—296,930. Total steam—1,587,006,955.

Q. Now, if you will, the net generation, giving the figure

—2,552—

5921 not by plants but as an aggregate figure, if you can? A. The net generation represents the difference between the gross generation and the amount used by house turbines and house auxiliaries and other equipment in the plant. The net generation in total for the hydro was 979,643,130; steam net generation—1,488,752,501.

Q. Now will you relate the occurrence of the system peak load in 1939 to the demand imposed by that load on the individual stations? A. The distribution of the 1939 peak, which occurred at 5 p. m. on the 12th of December, was: Osage plant—45,000 kilowatts; Keokuk—86,000; Ashley Street—

5922 20,000; Rivermines—Zero; Cahokia—293,000; Venice—32,000; Cupples—zero.

The combined distribution was 131,000 on hydro and 345,000 on steam, making a combined total peak of 476,000.

I should have given you the combined total of net generation as just previously. That figure was 2,468,395,631 kilowatt hours.

I think that it is clear that these last figures on peak demand have been kilowatts, which is the rate at which the power is being taken.

5923

Q. Now are the steam cycles employed in the generating stations of the Union Electric Group consistent with the cost of fuel to that group? A. The answer to your question is "yes", but without a little further explanation that may

—2,553—

not be entirely sufficient.

You will observe, from the figures just given on generation, that out of a total of 2,579,000,000 kilowatt hours, 992,000,000 were generated by hydro. Now this was not a 5924
particularly good hydro year, in fact it was just the opposite for the Osage plant. The drainage area for the Osage plant lies out in Kansas and west. The rainfall in that area was much below normal. So that the normal generation by hydro would have been about the figure given here for Keokuk or slightly above, but Osage should have produced 400,000,000 or over. The result is that if I were to correct those figures for what might be termed a more normal year, you would have had at least 1,000,000,0000 or something above that generated by hydro, and a billion and a half, possibly, generated by steam.

5925

Thus it can be seen that the load factor on our steam system, the hours use per year of the capacity, is much lower than would be the case in a city which is supplied solely from steam plants. In other words, you have to always keep that in mind on every one of our operations and our designs. For example, as I have stated earlier, the annual load factor on some of the Ashley Street equipment which is used for 25-cycle reserve for Keokuk, is extremely low, in some years below 5 per cent. Obviously, on equipment used for such purposes, the total annual cost is almost entirely fixed

charges on the investment, and the operating expenses are very slight, and the efficiency in operation is of little con-

—2,554—

sequence.

What we want for that purpose is equipment which can be started quickly and which will operate reliably. Reliability, quick starting and low annual fixed charges are the ideal requirements for reserve equipment for hydro.

Now for a high load factor steam plant, maximum
5927 economy, with reasonable investment and reliability are the requirements. In other words, they are radically different.

Consequently, in diluting our total system kilowatt hours with the hydro production, we have a decided effect on the operation of the steam plants.

Stated another way, we could not afford to spend as much money for the most efficient steam cycles because they do cost more, as we could afford to spend if we were operating a straight steam system.

For example, Keokuk, which only once in 80 years of rain-
5928 fall record would have gone below about 65 or 70,000 kilowatts supplied constantly every hour of the day, every day of the year, right on our base load. If we didn't have that energy we could, in the place of it, purchase and operate the most efficient steam turbine of 60 or 70,000 kilowatt capacity which we could acquire, with one exception, that we have a reasonably priced coal readily available. If we were to have high price coal, such as occurs in New York and New England, roughly speaking 16 cents per million B. t. u., as

—2,555—

compared with 11 to 12 cents in St. Louis, we could justify

further refinements. The result is that we have to consider the steam cycle as applied to St. Louis, taking into account our cost of coal and the application of our hydro plants, and determine the best cycle for use regardless of what somebody may do in some other location under different conditions. We have concluded that our best steam cycle for the new Venice plant is 850-pound-900-degree equipment, but we recognize that if we were to suddenly put in twice as much equipment at Venice immediately as we are contemplating, we could not give the next two units that high load factor, 5930 and it would not be economical to do so.

Does that answer your question?

What I want to make clear on my own account here is that I am not criticizing nor advocating any particular steam pressure or temperature, for conditions that justify 1,250 pounds, 925 degree units, that is all right. Mr. Ford put in such a plant. He runs it at the maximum capacity 24 hours a day. One of our own system companies has such a plant. Their coal is much more costly than ours.

In our case we have calculated all of the different pressures and temperatures, and have selected the one which, 5931 in our opinion and with the advice of our associated engineers in our system of companies, will work out the best for us.

Q. In terms of economical operation? A. In terms of

annual overall minimum costs, including all costs.

Q. Will you state what factors have entered into the selection of the generating station sites which you now have in use? A. The selection of a site for a generating station

is a very important engineering and economic decision. Much has been written about putting steam plants at the mouth of coal mines. It is actually a fact that at Pittsburgh, at the junction of the two rivers in the city, they have some plants which are located on adequate water supply and which are very close to the coal mines. But in most cases the mouth-of-mine plant has been the dream of authors who had very little to do with the power business. There are very few mines in the world that are located where adequate
5933 condenser water would be available to run a plant of any size whatever.

—2,557—

The offsetting factor, even in those applications where you do have both the coal mine and the load and the water all at the same place, there, in order to protect youreself, you usually have to acquire a control or actual ownership of such a large acreage of coal land, looking to the future, that your fixed charges in the early years are frequently discouraging, and even then you may not have guaranteed yourself a supply any better than the person who simply is in position to con-
5934 tract with any coal district in the country that is in position to furnish the required amount.

In the St. Louis district, we have a choice of two coals, one located near the city with a relatively low heat content, and a rather low cost. To be exact, the heat content runs around 10,000, or a little over, B. t. u. per pound, and the cost delivered to the plant would be in the general range of 9.3 to 9.5 cents per million B. t. u.

Or, we can burn a higher grade of coal, which comes from Franklin County, Illinois, lying to the southeast, a distance of roughly 100 miles, and that coal has a much higher B. t. u.

5935

content, something under 11,000, a lower sulphur content and in every respect better suited for power plant operation. We prefer to burn the better grade coal, and have not been able, so far, to completely successfully burn the low-grade coal without reducing the ratings of our boilers. If we reduce the ratings and get less out of them, then we have to have more

—2,558—

boilers and that increases the investment charges. So when the thing is carefully analyzed over a period of years, so far our conclusions are that the burning of the better fuel is preferable. That means, then, that we must have railroad facilities from our proposed plant site to these Franklin County or Southern Illinois fields, but under no condition would we want to locate the plant so that the low-grade coal might not be conveniently available. The reason for that is that these coal rates and freight rates and arbitrary charges are being changed year by year At the present time you have what is known as the Guffey Bill, which fixes the price at the mine.

5936

Suppose they were to change that next year, we might have to change and use a low-grade coal. So, looking many years in advance, we must protect ourselves with good transportation facilities between the coal field that we are using, and those we may have to use, and the plant. We must also observe switching charges, because, under certain locations which are otherwise very favorable, the local conditions might add from one to two dollars per car for switching charges.

5937

Now we next have to look at the water supply, and that is convenient in the St. Louis district anywhere up and down

the Mississippi River, but foundation conditions and available land are not so convenient. The thing has become so well occupied and so much demand for river front sites right close to the city has gone up, and so much question as to

—2,559—

what constitutes the river and where the boundary of it is, that there was an act of Congress passed to fix what are known as harbor lines, and those lines have been designated, and you can build up to a certain line called the harbor line.

5939 Now then, at Cahokia, the site finally picked after considering all of these factors, was selected containing 56 acres, and even back 16 or so years ago, we had to pay, I believe, better than $5,000 an acre for those 56 acres, and a good part of them had to be filled and brought out to the harbor line.

Today we have this site at Venice, which will accommodate a 400,000 kilowatt plant, but I wouldn't know exactly where to get another close, convenient site. Our next move would force us to go north up the river, and increase our transmission or distribution costs to get a favorable site.

5940 We have this disadvantage that foundation conditions on the river are very severe, and in addition to that we have to design a plant to take a variation of at least 36 foot in head of water. The river may, at extreme low water conditions, be here (indicating), and at extremely high water, may be possibly 36 feet higher. You can compare that with a lake plant where there is practically no variation in head.

But we have the added advantage that we are right at our load and the cables coming directly from the plant to our various city sub-stations without any intervening transmission investment, or liability.

—2,560—

I could go a little further and describe the hydro plant location, but after all, that is pretty well understood by everyone, that you have to locate a hydro plant where a dam can be constructed on a river, and where overflow facilities can be had.

For example, in the case of the Osage project, we had to move one or two towns, and a railroad, and something over 2,000 cemeteries, and I don't know just what else—a great many things—to get the basin, where the storage was going to be, cleared. 5942 There are very few places in the Middle West where you can afford to overflow land these days, that is, the investment is so high that it would render the project relatively unattractive if you had to do too much of that.

We were contemplating raising the head of the Osage project another 5 or 10 feet, and we found that to do so would flood out one major railroad, and would tremendously increase the investment, with more than the gain to be obtained. We did raise the height 5 feet above the original contemplated figure, and found that that was advantageous.

Q. Isn't there a rather heavy load on the Illinois side of the Mississippi River, as well as in St. Louis? 5943 A. At the present time the load flowing out of the Cahokia plant itself is about equally divided at times of peak, about half to the Missouri side and half to the Illinois. The difference

—2,561—

in the characteristics of the load are rather noticeable; the Illinois load has its peak at a slightly different time than the Missouri, city load, and the Illinois service is supplied over a smaller number of high voltage circuits, whereas the city load is supplied over a large number of submarine

cables at 33,000 volts, going direct to our distribution sub-stations, which we will describe later.

Q. And the central location of these stations results in savings in transmission costs, and in reduction of transmission losses, isn't that correct? A. Yes. People rarely realize the actual cost of electrical connections. I have always had a good deal of amusement out of a little selection we made at one time, on a relatively small scale. We bought a lot down in the city, and decided to locate the
5945 downtown sub-station on the back end of the lot, and rent the front of the lot for business purposes. It sounds logical.

We did that, but after several years' experience, I made a calculation and it showed that the fixed charges on the cable connections to run that 60 feet from the back of the lot to the front, were at least equal or greater than the rent obtained from the front facilities. In other words, all our worry about getting the store in front was really offset by just a few feet of very heavy cable connections.

I use that to illustrate the point that every foot you

—2,562—

5946 move a power plant away from the city runs into money.

I had occasion to make a calculation recently in which there were four 66 kv. cables required to carry the load. Those cost, roughly, including conduits, about $15 a foot each, or $60 a foot for the four. If you multiply that in round figures by 5,000, you would have $300,000 a mile, so if you were to move your plant away from the load one mile, and had to supply it with these four cables, it would cost you about that amount of money, and if you did it at a lower voltage, it would cost you more than that. So that

that brings out the advantage of a site immediately adjacent to the large load.

Q. Are the same favorable conditions applicable to the location of the Ashley Street plant? A. Ashley Street plant itself is located almost out in the river, and we have been repeatedly told by the War Department, who have control of the channel in the river, that we ought to enjoy that plant because we will never again get a chance to put one out there like that. In other words, it is of great advantage to us, although not much to the liking of the War Department 5948
engineers whose job it is to maintain a straight channel up and down the river. And the old Ashley Street plant, and several other concerns at that location, were permitted in the early days to establish themselves farther out in the river that they will let you do now. That is decidedly ad-

—2,563—

vantageous to us from the standpoint of condensing water. Cahokia is pretty well located, but it had to be put back farther on the shore than the Ashley Street. Ashley Street station is within a very short distance of the major down-town load. 5949

When I come to a little description of the downtown distribution system, I would like to digress there a little and describe the density of our load, and its small area, but high density as compared with New York City, for example. And Ashley Street is located very close to that dense section.

Ashley Street, also, supplying our steam-heating requirements, would have to have some such location. You can transmit electricity over a considerable distance, but you cannot transmit steam an unlimited distance, and if Ashley

Street were not located the way it is, we probably would have to have a duplicated steam-heating station, and a separate power generating station. By that I mean, the particular location there permits a joint operation which would not be practical otherwise.

I would like to make one other statement here. We need Ashley Street for electrical reserve, we must have it for steam heating, and the two work in well together. But, if we weren't permitted to have a location down there near
5951 the city, we would have to have a separate steam-heating plant which, if located out west farther and closer to the center of load, would have to buy city water, which is ex-

pensive, and we would have to make a corresponding addition to some other electric plant. So that we are constantly confronted with the value to our system of the Ashley Street station, and if it ever wears out, we will have to try to replace it again in the same site, if we are permitted to do so, and I think we will be able to do so.

But in order to protect our interest, and to be sure that
5952 the Ashley Street station is in no way a disadvantage to the community, we have cooperated with the local group there recently in a smoke elimination campaign, and are just completing a Cottrell plant, which is an electrical precipitation device, and that is going to be tested within the next fifteen days. My own little engineering group made the layout for the equipment, and it is the only known way so far of completely eliminating the finer particles of smoke.

Q. Now are switching and step-up transformer stations provided at each plant site? A. They are. St. Louis is one

of the few places which concentrates to a large extent on operating with what we call individual transformers and lines.

For example, out of Cahokia we go out from the main bus at 13,800 volts, put an individual 12,000 kw. transformer on a single 33,000 volt cable, go an average distance of approximately 5 miles, step down through another 33,000 volt trans-

—2,565—

former, to a 4,000 volt sub-station, at which point we have an oil switch on the 4,000 volt side. 5954

The result is that the transformer, the cable and the second transformer are all treated as units. We don't do any high voltage switching, and that circuit then is duplicated form some other bus section in the plant, to this sub-station.

The result is that we have a simplicity of arrangement and a safety in operation and convenience that is hardly possible by other methods, and we feel that the added investment in the transformers is to a large extent offset by the saving in oil switches, and that the net result is more reliable.

Now in addition to the transformer step-up and switching station which goes with each power plant, we have some bulk 5955 power step-up stations at Cahokia, and the other plants, where we do have the other method used, namely, high voltage outdoor oil switches and conventional design of steel structure.

Now the figures which I gave you for plant investment do not include any of the equipment which I am now describing.

At Osage, the plant is operated at generator voltage, 13,800 volts, and stepped up immediately to 138,000, with

5956 *Stanley Stokes—By Respondents—Direct*

no high tension breakers at either end of the line; in other words, we follow the same principle at 138,000 volts that we do at the lower voltage. That line comes on into Page Avenue and steps down, and switching is done at 13,000 volts on each end, no high voltage switching.

—2,566—

I should go a little further and describe the fact that we have provided a double bus at Keokuk, and by a double
5957 bus I mean just about twice the investment for a single bus, that is, each typical feeder out of the plant can be supplied from either one of two buses, instead of from one only, which is very frequently done, and permits any bus to have the voltage removed for cleaning and repair work, and permits immediate transfer of a feeder, if anything should go wrong with a bus, and in every respect it is highly desirable except that it is a little expensive.

Our conclusion is that rather than attempt to reduce the cost of equipment itself, which means reduce the quality, that our best road to future economy is to concentrate on carry-
5958 ing more power per unit; in other words, if an oil switch costs roughly $35,000 installed, including its position, at Cahokia, or at the new Venice plant, which it does, the more kilowatts you take out through that switch, the less the unit cost per kilowatt, and we have decided to give continuous attention to keeping the ratings and actual use of the equipment as high as we can; in other words, keep it loaded to capacity, and thereby try to keep the investment within reason, because this equipment is consistently increasing in cost each year.

I always like to make the point that every time you spend $35,000 for an oil switch in position, you are spending real money to open the circuit and eliminate the revenue, cut the customer off, or something, at least they don't bring in any revenue and they are a necessity. But we have so far not been able to eliminate them, and offer any substitute. We are strongly interested in the new air-circuit-breaker equipment which is now being offered, and have purchased two sub-stations with the new type of equipment. We will watch with interest the tests which are going to be made this coming month for some breakers which have been ordered by the Consolidated Company—it happened they were the first ones to order them—and no one knows just how they will perform, but they are a new development in air circuit breakers to take the place of oil circuit breakers. Those that we have purchased have worked very well indeed, but they were at smaller ratings.

—2,567— 5960

Q. Now will you describe the design of the switch-house at the Cahokia plant? A. The Cahokia switch-house has been changed in design somewhat from its original inception. Originally, it was a straight, double-bus arrangement, with what are known as selector oil switches, so that any turbine or any feeder can be put on either bus by the operation of oil switches under the control of the operator at the board. 5961

We wanted to purchase a 75,000 kilowatt, two-winding machine; having already purchased one a few years ago, and having gotten good results from it, we wanted to use another one, and it was difficult to locate that two-winding machine suitable in that particular bus arrangement.

—2,568—

5962 So we, by making very slight physical changes, changed it into a ring bus, in which each of the two double buses furnish the two sides of the ring, and the ends were closed through these double-winding 75,000 kilowatt machines. That made a very satisfactory arrangement. The individual machines in between those two, which covered the two ends of the plant, are single-winding machines. The result is that we have eliminated, by that means, an inherent difficulty which can arise in the operation of large, two-winding ma-

5963 chines, if they are located adjacent to each other down a bus.

I should explain here that a two-winding machine is simply a large generator in which there are two independent, parallel windings, each of half capacity, instead of one customary winding of full capacity, the reason being that the short-circuit problem involved with those large machines in a single-winding, is very severe; and at the time we bought the first one, switches were not available to handle it, and even today we wouldn't want to pay the price if they could be had.

5964 So the two-winding machine is a means of keeping down the short-circuits, and also provides a means of obtaining a little over half the capacity of the machine, even though a part of the other winding might be in difficulty.

—2,569—

Now it would be presently characterized as a ring bus design of 12 sections, terminated at each end of the plant or made continuous through these two-winding machines. That type of bus is very satisfactory up to a certain limit. We think that Cahokia station has now reached that limit, and we do not advocate that particular design if we wanted to

push it above two such machines, that is, above the 300,000 limit. The new Venice plant is being designed so that it can go to 400,000.

Keep in mind that I am not advocating a 400,000 kilowatt plant just because we like a big one, and we may never build it to that extent, but there are conditions there with regard to the river, sites and other factors, which may make it desirable.

The result is that we do not want to do anything today in the electrical design which will preclude such possibility. 5966

With that in mind, we have designed a different type of bus, known as a synchronizing bus, a transfer bus, and a third bus which carries the generator and the feeders. This is not a new idea, but in the application of it we are adopting some rather new arrangements. This is not a cheap arrangement, it is probably a little more expensive than the Cahokia scheme, but it does provide for independent control of what we call our kilowatt load as distinct from the control of the reactive or kilovar load. One of those is the part of the power

—2,570—

that is used for magnetizing the fields of all of the equipment, 5967 such as motors, and so on, and which is generally spoken of by electrical engineers as being at right angles to the main power. I will explain that a little more in detail to this extent, that at unity power factor you can put considerable load through what is known as a reactor, a choke coil, which is inserted in the bus or system to keep the short-circuits within bounds. You can put considerable load through that choke coil at unity power factor with very little voltage drop.

If, however, you attempt to put low power factor load through that choke coil, you get an excessive voltage drop.

5968 *Stanley Stokes—By Respondents—Direct*

Consequently, in operating a large system where we have to shift the reactive power around a system to control voltage, and have to deal with it in every respect as carefully as we do our kilowatt power, we must have provision for full voltage control, and by connecting our tie-lines to this synchronizing bus, we can transfer, we will say, a 60 per cent. power factor load, of 50,000 kilowatts, into the plant, let the kilowatt component flow through the synchronizing bus, and the reactive component go to the transfer bus or
5969 the turbine itself, and each turbine then can give us voltage control and thereby get satisfactory operation from the plant, and not have a lot of limitations which cause a plant to operate at less efficiency, from the standpoint of investment, than it should.

—2,571—

Many plants are built, and look to be all right, but you never can do everything with them at one time that you should be able to. This is an attempt on the part of the electrical design to see to it that no limitations will exist from day to day that will reduce the effectiveness of that
5970 investment. It is a joint endeavor on our part and that of the Stone & Webster Engineer Corporation. Both of the engineers, myself and their engineer, have worked quite a while on this thing, and we have great hopes for its success; in fact, we know it will be all right.

That is about all, I believe, that I would care to say on the Cahokia switch-house.

I would like to point out that in these modern big systems, that it does cost a lot of money to connect a feeder to a big, high-powered plant. We use, for round figures,

$75,000 as the cost of taking a feeder out of Cahokia, and that means that you have got to take some load out on that feeder or you are going to have a lot of investment tied up.

So we are gradually stepping up our sights as to the amount of load that we can take out on any one feeder, and our ultimate goal would be a plant where every feeder took 50,000 kilowatts out of the main plant, and then we would break those out up some other point into some lower voltage delivery.

Q. Now is pulverized fuel in use in your steam plants? 5972

—2,572—

A. Yes, it is in use in all of our major plants, both Ashley Street and Cahokia, and will be used in all future plants. It is very successful. We have two systems in operation at present, one known as the storage system, in which the coal is pulverized and delivered into a bin, and from there delivered to the boilers; the other system is known as the unit pulverizer, which provides a separate grinding device and delivery to each boiler. We ourselves prefer the latter, and our new plant is being so equipped.

Q. How about the existing plants at Venice and River- 5973 mines? A. They are stoker plants with the exception of the new boilers at Venice, and they are pulverized fuel boilers. The old ones are stoker. I think it is a safe guess to say that 95 per cent. of our power output in kilowatt hours here, from steam production, is probably made from the pulverized fuel. The pulverized fuel operation is becoming so perfect and so satisfactory that in our new plant we are considering a design in which there is no partition wall between the boiler room and the turbine room, just columns. That seems

like rather an unusual arrangement, but there seems to be no reason for not having it.

Q. Is auxiliary equipment duplicated in the design of the new station? A. Well, it is duplicated, and even a little more than that in our present Cahokia station, but in the new sta-

—2,573—

tion we are making provision to try to take care of those things which have happened and influence the reliability of power supply.

5975 As these boilers get larger and larger, and the pressure higher, it is more important that the boiler feed pumps not stop. It is a matter of seconds in some types of design from the time they stop until the boiler goes up, and in our case it might be a matter of minutes.

So we are providing five boiler feed pumps for two boilers. That is, each boiler has a pair, and then there is a spare for the group, and those boiler feed pumps are a mixture of electric and steam, which is advantageous for heat balance control.

The new plant at Venice will have a big concrete intake

5976 caisson down to bed rock in the river, and that caisson will be divided into two halves, and each half will be divided into two pumps. It sounds like the "House that Jack Built". The individual pumps can carry the first two sections of the station, that is, in other words, we have to first guard against any trouble with screens or water supply which might throw one-half of that caisson out of commission. We certainly have got to be sure that the other half will carry the plant.

Then, if the other half is carrying the plant, and if such a condition as that should occur, that half of the caisson

—2,574—

could readily be out of service for some time, because if something were to break or fail, or the traveling screens were to get jammed, or some work required under water, we might have to shut down one-half of that caisson to get a diver down there to do the work.

With that in mind, the pumps in the other half should be able to take care of the plant, and it is so designed. At the present time, all of those pumps are not being installed because the capacity of the plant is not up to the full rating, but the same ratio is being maintained. That is about the 5978
most extensive triplication we have done, but it is most vital to the plant. That supplies the condenser water to all the turbines.

Q. Now, why are these duplicate facilities provided? A. Well, the idea is to maintain continuous service, and everything that you can do with that in mind, without wasting money, is in the direction of the best operation.

Frequently we make this kind of a calculation—assuming that we are in business to supply the best possible service, and still knowing that 100 per cent. service, if there were such a measure, can never be supplied, or if it could it 5979
would be at such fabulous prices that nobody could afford to buy it, the question that has to be finally worked out is—what grade of service can be supplied from a plant or a utility to the public, which is most feasible and most

desirable by both? It wouldn't be 100 per cent., and it certainly wouldn't be 70 per cent. It might be 85, and it might be something up in that range, but as you approach perfection, you increase costs out of all proportion to the gain

made, and if you finally insisted on having a system on which there could never be any interruption, there couldn't anybody afford to buy the power.

Now with those things in mind, we tried to design equipment which is within reason as to cost, and which will deliver such highly reliable service that any attempts to improve it beyond that point would be regarded as wasteful.

Now that again is a function of how big the plant is, what happens if it is lost, and a great many factors. In a
5981 very small plant where we can lose the whole plant without affecting service, we wouldn't worry about it. But when you contemplate these major systems for metropolitan service, the cost of an interruption, or value of it, is so great that these things become justified which heretofore have not really been contemplated, and if they increase the cost of your whole development by possibly one or two per cent. over and above what might be considered regular, and if that 2 per cent. can be shown to be advantageous, both to yourself and to the public, we think that where it is about an even break, that it ought to be put in rather than saying that where it is
5982 about an even break that it ought to be omitted. If we

become very poor some day, we will have to change our views a little bit, but as long as we can really get the money and put these things in, we think that it is good business to do it.

Now that again is a matter of engineering judgment, because it isn't a thing that anybody can lay down exact rules and regulations to cover. We want to get good service, the best that can be had, but we must also keep in mind that perfect service would be unapproachable, and too expensive to use.

Those bases of reasoning have a very wide application and a bearing on the type of plants, and when somebody says to me, "Why does your plant cost a little more than my plant?", I say, "Well, we were very careful in putting it in, we didn't waste any money, our man-hours on the installation are reasonable, and the only reason is that there is more in the plant, more equipment there."

We could omit some of it, but we would have to put it in some other place in the system, or would have to have some other form of duplication, or would have to build some other 5984
kind of a plant to make up for it if this were out, and on the whole I think the duplication of auxiliaries in a main steam plant is absolutely justified.

The Examiner: We will recess until 2 o'clock.

(Whereupon, at 12.30 o'clock p. m., a recess was taken until 2 o'clock p. m., of the same day.)

5986 *Stanley Stokes—By Respondents—Direct*

AFTERNOON SESSION

2:10 p. m.

The Examiner: Let us resume.

Whereupon, STANLEY STOKES, the witness on the stand at the time of recess, resumed the stand, was examined and testified as follows:

5987 *Direct Examination by Mr. Hamilton (Continued):*

Q. Mr. Stokes, this morning you referred briefly to the steps the Union Electric group has taken in the direction of reducing fly ash pollution. Will you explain those steps in more detail and, also, state the significance the problem represents? A. First, if I may, I would like to describe a situation with which St. Louis is confronted. The coal which is available for residential use at low prices is of high volatile content and does make smoke and ash. The poorer classes in the community can not afford to burn the higher-priced coal and even the next higher-priced grade of Southern
5988 Illinois coal is, also, a highly volatile coal and makes a lot of smoke. It is very difficult to fire it in hand-fired furnaces or stoves.

The smoke problem in St. Louis has become more pronounced in recent years and at periods of low wind velocity we have quite a considerable difficulty.

The civic groups have recently taken the matter up and

have succeeded in passing ordinances for certain smoke prevention rules and regulations and are insisting on stoker-

fired equipment in commercial establishments but, as a result of carefully made surveys, they find that the large percentage of the smoke is made by the small, independent user and that something like 37 per cent. of all of the coal-burning applications in the city proper are still the old fashioned stoves in the poorer districts.

It, thus, becomes somewhat of a social problem to take care of. You can not insist that people pay more for fuel than they can afford to. At the same time, the smoke that they make is detrimental to the interests of others, but dur- 5990
ing the period in which this effort is being made to eliminate smoke in so far as possible the utility who burns the greatest amount of fuel in the district is naturally involved. We do not make much smoke, as such, but we do burn lots of fuel and some of it goes off, out of the stacks, in the form of fine, light gray ash.

To cooperate with the civic movement we have recently agreed to provide the latest known form of equipment to eliminate smoke from our plants. The first application of this equipment is at our Ashley Street Station where new boilers are being installed and being equipped with what is 5991
known as Cotrell precipitators. These are electrical devices for collecting the particles of ash and carbon that form smoke.

This type of equipment comes in many forms, but the particular one we are putting in is known as a plate type precipitator and consists of a series of grounded plates, meaning

that these plates are connected to earth electrically, and in between the plates are suspended fine wires which are charged

5992 *Stanley Stokes—By Respondents—Direct*

to a relatively high voltage direct current. The gases which leave the boiler pass by these wires and between the plates and the gas becomes what is known as ionized as a result of collision between the electrons that are being sent out from the highly charged wire and the gas molecule.

The gas molecule then becomes charged, itself, and is attracted to the grounded plates. Once the particle reaches the plates it loses its charge and there is no longer any attraction but it has a tendency to stick there unless some-
5993 thing dislodges it. The result is that the smoke comes in at the bottom of this thing and it is repelled by these wires and the particles stick on the plates.

At some convenient interval this material is removed or otherwise driven down into hoppers and carried off in conveyors and into a storage tank or a loading or sacking device where the stuff can be put in sacks.

At the present time there is not enough market for this material for us to justify sacking it and we will have to dispose of it. We are not permitted to pump it out on the river because it will float. These particles are so fine that they,
5994 themselves, are not readily wetted and you can't get them to sink, so that they would float down the river for some miles.

—2,580—

That means that we would have to acquire a joint property and have some form of pit where we could pump this stuff in and let it settle.

Some day we hope to acquire enough demand for the material to make its sale at least enough to warrant its shipping. It is now used in small quantities in cement manu-

facture to make the cement harder or to waterproof cement.

The cost of this particular equipment for the two boilers at Ashley Street is in the order of $60,000 but we will later have to equip more boilers and that will increase the cost. At Cahokia, which is our large steam plant on the East side of the river, we are trying out the first section with an experimental installation. It is estimated that the precipitators for the complete plant may run in the order of $1,000,000, as the quantities of gas to be handled are very large and there is not room on the roof to install the equipment and there is 5996
some question about the weight of that much equipment being added on to the existing structure, so that we are actually building what is equivalent to a small new building alongside, carrying the gases out into it and down and back up into the stack and out.

This first section is under construction. My department is now laying out the details of the electrical part of the equipment. In order to obtain this high voltage direct current you use some form of rectifier. You start with alternating currents and transform it up to high voltage and either by vacuum tube or mechanical rectifier transform it 5997
into direct current.

—2,581—

The quantity of ash that is collected in this manner is very considerable. Illinois coal runs from 14 to 15 per cent. ash and a certain percentage of that, which I can't state exactly, is carried up the stack in the form of smoke.

The community, I think, is well pleased with our cooperation. It isn't one of those things that we benefit from directly. It does cost us money and it doesn't contribute

5999 *Stanley Stokes—By Respondents—Direct*

anything to producing power, but it is a benefit to the community.

Q. The program is a voluntary one, is it? A. It was offered voluntarily by the President of our Company without any attempt to protest the expense or any other strings tied to the proposal. The city has accepted our proposal and we have stated that we have to have some time in which to work out the Cahokia job and are engaged now on the first section.

5998

Q. To indicate the significance of the problem, can you state, if you know, how atmospheric pollution due to smoke in St. Louis compares with, let's say, Pittsburgh and some other city? A. Well, I don't particularly like to advertise my own town as a smoky city, but I believe the facts are that Pittsburgh, which originally had the honor, carried on quite a comprehensive smoke-elimination campaign and has improved the situation there tremendously.

Actual measurements are periodically made of the amount of solid matter deposited and some of the measurements

6000 —2,582—

made in the residential section in the poorer districts of St. Louis seem to indicate that the deposit there is really heavier. I want to point out again that it is not the large manufacturing concerns nor the utilities nor major industry that are at the bottom of the trouble. If they were they would simply order them to stop it and they would have the financial ability to do so. The problem is a social one and involves the inability of the people, who make the most of the smoke, to do much about it.

There is another economic problem involved. We are practically forced, as a matter of plain, ordinary economics, to buy the coal in the district which is reasonably adjacent to the community, so that those people have a means of livelihood. The full solution to the thing has not yet been obtained but industry and commercial establishments are really doing their part this coming winter.

Q. Now, is the new station at Venice similarly to be equipped with this type of equipment? A. The precipitators for that station are already purchased and will be installed 6002
as soon as the building is up.

Q. And are you able to approximate the total investment, the total outlay required to pursue this program on the part of the Union Electric group? A. Well, when I stated that the Cahokia Plant would cost, possibly, $1,000,000 that was a somewhat rough estimate because we do not

—2,583—

know just how we are going to do it. I would say that if Ashley Street cost $60,000 and the new Venice Plant possibly $100,000, that the million dollar figure, including all 6003
of it, may be reasonably correct or it might be $1,100,000. It is in that order of magnitude.

Q. Now, turning, if you will, to the main transmission system of the Union Electric group, will you refer to Respondents' Exhibit Number 51 and state for us the principal lines constituting the main transmission system? A. We have, in presenting this exhibit previously, made brief reference to the main transmission lines which run from the Keokuk Plant to the St. Louis plants and also from the Osage Project to St. Louis. There are other lines shown

6004 *Stanley Stokes—By Respondents—Direct*

on this exhibit between the Cahokia Station and the Venice Station and between the Cahokia Station and Ashley Street and between Venice and Page Avenue sub-station.

I should like to give some information as to the character of this construction and may bring in in this discussion some one or two other lines that were not considered of major importance and may not, all of them, be shown on that exhibit, but probably most of them will be.

6005 The system in St. Louis is made up of both overhead transmission lines at voltages of 33,000 volts, 66,000 volts, 110,000 volts and 132,000 or 138,000 volts. Those are used interchangeably and it really means that the sending voltage and the generating in the line is 138,000 volts and the re-

—2,584—

ceiving voltage is closer to 132,000.

I should like to use the abbreviation "kv." for kilovolts, meaning 132 kilovolts or 132,000 volts.

6006 We have described the various plants and made some reference to the interconnection of the line and the economies which occur thereby, and I may have to slightly repeat in some places here in order to completely describe this situation. I will try to avoid it so far as possible.

The main transmission system consists of the tie lines interconnecting the six main generating plants and comprises over 1,000 miles of 3-phase circuits including 628 circuit miles of 132 kv., 60-cycle, wood pole and steel tower lines—by "wood pole" I should explain that these are what is known as "H" frame construction, each tower consisting of two wood poles connected by a horizontal crossarm and carrying three wires in horizontal configuration—287 circuit

miles of 110 kv., 25-cycle tower lines; 15.8 circuit miles of 66 kv., 60-cycle underground cables; 9.6 circuit miles of 66 kv., 60-cycle steel tower lines; 10.9 circuit miles of 33 kv., 60-cycle underground cables; and 68.8 circuit miles of 13.2 kv., 25-cycle underground cables.

The Keokuk Station on the North, generating at 25 cycles, is connected with St. Louis by two 110 kv., 300,000 cm.—the abbreviation for circular mills—copper circuits, each 143 miles long, carried on double circuit steel towers and terminating at the Page Avenue sub-station where three 6008

20,000 kilowatt frequency converters interconnect the 25 and 60-cycle systems.

Q. And that line was placed in service in what year? A. 1912 to 1913. I believe it was completed the latter part of 1912. I have a reference to that. They really went in service in 1913 although it was being constructed all during the year 1912.

In addition to those frequency changes or converters there is, also, a group of connecting cables between this Page Avenue sub-station and the Ashley Street Plant which 6009 operates at 13,200 volts and is described more particularly in what we referred to later as the subtransmission system.

There is no specific definition of what constitutes a subtransmission system, but it means, in general, a larger quantity of lower voltage circuits than your main highest voltage lines.

The Ashley Street Plant, which has both 25 and 60-cycle generators, is connected, as stated, to Page Avenue by these 13,000 volt underground cables, eight of them, and the 60-

cycle portion of the Ashley Street Plant is connected with the Cahokia Plant through four 33,000 volt cables of large size. These cables are supplied by transformers at the Cahokia and Ashley Street ends.

The combined transmission capacity between Cahokia and Ashley is, roughly, 50,000 kilowatts, more or less. The reason these terms have to be somewhat approximate is that the varying temperatures make a difference in the rating and

—2,586—

6011 one has to take into account, if you are speaking of minimum capacities, that you have to speak in terms of summer conditions. At other times the capacity is considerably larger.

The Osage Plant is connected to Page Avenue by two 138 kv. 60-cycle, single circuit lines. Now, these two lines are on separate structures and are not sufficiently far apart so that any trouble on one circuit would not affect the other. They are almost entirely on private right-of-way with the exception of certain parallels about 7 miles long on which we are on the edge of a railroad right-of-way. That, of course, is private right-of-way in the sense that we have easements, but

6012 I referred in the other case to the fact that the eased right-of-way strip is in the order of 250 feet wide for the other circuit.

Q. These structures each carry 250,000 cm.—I beg your pardon. A. These lines are 336,400 cm., aluminum cable, steel reinforced, ordinarily abbreviated as A. C. S. R. The circuits are 135.5 miles long, each, and are carried on structures which have been designed as a result of considerable special research work at the time.

Certain improvements in the knowledge of the transmission art have occurred in recent years and to take full ad-

vantage of this information we went through some actual tests to determine the most economical way to obtain a maximum insulating value which includes the wood, itself, at the

—2,587—

most moderate cost. The circuits are designed for 50 per cent. overload over and above the minimum requirements of what is known as the National Safety Code.

The district in which we operate is considered to be what is known as the heavy-loading district, which means that we obtain certain specified sleet, ice and wind loads. 6014

The design of those so-called Osage-Page Avenue lines conforms to the very latest information available. Actual flashover tests were run on these structures with lightning generators and the voltage at which lightning could flash the circuit over was reproduced in the laboratory. Roughly speaking, as I recall it, it takes in the neighborhood of 6,000,000 volts to flash the circuit on a sudden impulse. That includes the insulating value of the long insulator strength plus at least 8 feet of wood, which is in the circuit, before it can get to the ground.

I might bring out how that is accomplished. The over- 6015 head ground wires, of which there are two, are carried on top of the poles, one on each pole, at a distance of some 6 or 8 feet above the arm, in addition to which the ground wires, themselves, are stretched tighter than the conductors and obtain additional clearance in the middle of the span so that in the middle of the span they are probably 15 feet above the conductors. The ground wire has to be connected to the earth and the ordinary procedure is to run it right down the pole. This eliminates the insulating value of the pole, itself.

—2,588—

6016 If you don't have some kind of a ground wire down the pole, the pole, itself, is likely to be shattered by lightning. The method we used was to connect the ground wire which goes from the overhead wire to ground at a distance of about 15 feet out on the ground wire, itself, using great precautions in the type of clamp being used and in the nature of the conductor carried to ground, this latter being a copper-weld steel wire and connected into a clamp in such a way that there could be no electrolytic action and the clamp connected
6017 to the overhead line with a hinge arrangement such that there should be no occasion for this wire to break due to the swinging of the overhead ground wire.

—2,589—

That wire is then connected to the pole at a distance of about ten feet below the cross arm and from there on down it continues down the pole. The result is that any way the lightning tries to go from the conductor, either across the arm and up to the overhead wire or across the arm and down to the ground, it has to pass the combined installation of about 12 to 14 insulators and eight feet of wood.

6018 That wood is ordinarily good when dry for about 100,000 volts per foot for short-time step wave front lightning. The values under those conditions are only slightly different.

I want to make it clear that the porcelain insulators in this type of application serve to hold the operating voltage entirely. We do not depend in any way on the wood insulation for this but the wood insulation is largely depended upon for lightning. The results of this design have largely been a most attractive operating record, practically no failures. No load has ever been lost in the eight years, I believe, which is

the length of time that project has been operating. No load has ever been lost due to the operation of the transmission circuits.

Q. Have you stated the type of structure on which these circuits are carried? A. I have stated the construction for the Page Avenue lines only. I am now going over to describe the southern route which, on the exhibit, is from Osage to St. Louis by way of Rivermines in St. Francis County.

—2,590—

Q. Before you get to that and while we are still on the 6020
Osage-Page Avenue line, have you stated the years in which those two circuits went into service? A. They were put in with the Osage plant. It ought to be 1931. That is correct. They were put in service in 1931, and the second one followed the first one after a short interval.

Q. The second circuit? A. The second circuit and actually it was not really designated as being in service until the following year, 1932. They were both under construction in the same general period.

(Discussion off the record.)

6021

By Mr. Hamilton:

Q. I think you might put that on the record. A. The Page Avenue wood structures are fully impregnated with a vacuum process and the crossarms which are about 31 or 32 feet long and made up of 2 x 12's bolted together back to back with large spacer blocks in between to form a rigid truss.

Those arms were treated at lower temperature and under special conditions to avoid damage to the timber. Tests

were made, both before and after treatment, to ascertain the result, it being generally understood by the trade that fir could not be impregnated without certain damage.

This work was done by ourselves in conjunction with Stone & Webster and with the advice of the Forest Products Laboratory, a Government research agency for timber products, located in Wisconsin. They issue bulletins as a result

of the Government's research on timber.

6023 We took advantage of all the information available in their literature, what Stone & Webster had been unable to accumulate and what we, ourselves, had found, and we are certain that we succeeded in doing this job without damaging the wood.

That merely means that we will get longer life out of the pole line. We do not see why we should not get at least 35 years, minimum, and it is possible that with certain repairs we may go much longer than that, because there has been no experienced data really available on properly treated timber by modern processes.

6024 This treatment is toxic and the modern viewpoint is that rot is primarily a result of the eating of wood by various animal-type matter and that if the wood is poisoned it should last many, many years.

Q. Once installed, are these poles treated from time to time? A. No, the vacuum process takes the treatment clear into the heart wood, and there would be no possibility of treating them externally to do any good. I may say that so far the only things that have bothered that line at all are woodpeckers, and they have become discouraged after a few hours' work.

6025

(Discussion off the record.)

The Witness: The structures for the Page Avenue lines consist of long leaf, southeastern yellow pine

—2,592—

with vacuum impregnation.

The crossarms have been mentioned, I believe, and are made of western fir.

By Mr. Hamilton:

6026

Q. You are referring now to the lines from Osage to Page Avenue? A. Yes, these are the same lines from Osage to Page Avenue.

The other circuits from Osage to Page Avenue are a little more original in their design. The circuits leading from Cahokia south, crossing the river at Crystal City, the Mississippi River, and from thence on to Rivermines, as shown on that exhibit, No. 51, are double circuit steel tower lines. It was felt that the extension from Rivermines on to Osage should continue this type of construction, but we desired to obtain, if possible, a higher level of insulation against lightning.

6027

After comparing various types of construction and costs, we decided to build a steel structure designed for two 3-phase, 250,000 circular mill copper conductors arranged in vertical configuration on two sides of the tower but with a very large offset on the middle wire, it being supported about 15 feet out from the tower which will be explained.

Above the tower we have two overhead ground wires located as nearly over the conductors as is possible in a

practical design. These arms were all made free to swing.

—2,593—

This idea of a swinging arm, itself, was not original with us, but was invented by the Bethlehem Steel Corporation, however, it had had no application in practice because there was no particular gain to be had from a long steel arm and the only reason for swinging arms with a hinge at the top would be to make the arm longer than ordinary.

6029 I will explain that by stating that if the lightning merely has to flash over the insulator string to get to steel and thence to ground, there is no object in making the arm any longer than that same distance. On the other hand, if that arm could be made of insulating material which could be effective against lightning, then every foot you put in there will increase your lightning flash over value from 75 to 100,000 volt. The result was we decided to adopt wooden insulation in these arms, make them of a series of wooden trusses and make the middle arm about 15 feet long and the top and bottom arms somewhat shorter.

6030 If this had been a rigid arm without the hinge at the tower, it would be economically impracticable to build a tower strong enough to withstand the breaking strength of three conductors at an average distance of 12 or 13 feet from the top.

Those conductors have a breaking strength of, I would assume, in the neighborhood of six to eight thousand pounds each, which would mean we would have to support a possible load of eighteen to twenty thousand pounds out at a distance of 12 to 15 feet, depending on whether you are

—2,594—

6031

talking about the middle wire or the top or bottom wire. Those are approximate figures.

(Discussion off the record.)

The Witness: These arms are subject to a possible fracture due to lightning. In other words, they can be split. As a result, the tension member, which holds the arm and keeps it from falling, is made of a duplicated design, either one of which will hold many thousands of pounds if the other one is broken.

6032

We have actually had one case in which the lightning struck this line, shattered one of the arms and did not even interrupt the service which was being carried on the line. That is, the distance over which the lightning had to flash was o great that it could not maintain ionization across the gap and the power arc did not follow on through. That is the only case of this kind with which I have ever had any experience, although I have heard since of one other case.

6033

That is to say, we had a lightning flash over but the power arc did not follow and nobody knew anything about it, except that we had an oscillograph connected at Rivermines which operated and gave us an alarm. When we went out and examined the tower, we found that the lightning had evidently flashed all three wires on one side of the tower and without the service being disturbed on that same circuit.

Had that service been interfered with, the other circuit would have carried it as intended. The record

6034 *Colloquy*

of that line is very attractive and I will go into that

—2,595—

on a later chapter on operation, but it has fully met our expectations.

The reason those arms do not swing around, normally, is that the hinge at the tower is not a vertical hinge but is at an angle, and in order for that arm to swing around it has to lift the combined weight of itself and the span on either side, which is very
6035 heavy, consequently the vertical load of the span wires and of the arm itself keep it in its position, although it is free to move a certain amount.

The service obtained from this line is equivalent to that so far obtained from the other circuits, no load having been lost by either one, although a double circuit tower line of any construction, whatsoever, is subject to some types of disturbance which might not get both structures in single circuit lines.

It has been our experience, however, that the only thing which bothers a tower of this type is a tornado
6036 and unless the single circuit lines are widely separated, it could conceivably get both of them, as well.

St. Louis is in a tornado district and there are records of quite a number. We have had experience with two disastrous ones. We made an analysis of the transmission line right-of-way leading to the southwest from St. Louis for some considerable distance, although it was never built, and one reason it was not built was because we found a record of 42

6037

tornadoes that had gone longitudinally along this

—2,596—

route and, instead of taking the line out crosswise, they might have taken it out lengthwise and that was one of the discouraging features.

However, that proposed line was intended to connect to a dam which was contemplated on the White River and was never built.

6038

By Mr. Hamilton:

Q. Now, will you particularize about these lines somewhat more, and begin, if you will, with the section of line running from Cahokia to Crystal City, and will you state when that section was placed in service and give information comparable to that given for the other line? A. The section of the line from Cahokia to Crystal City was constructed earlier and I know the date, but I want to verify it, 1925. Now, that line was constructed for the specific purpose at the time of supplying what we would call our Jefferson County division, it being the county immediately adjacent to 6039
St. Louis County on the south, and primarily at the same time to supply the plant of the Pittsburgh Plate Glass Company, a very large industry which has one of the largest plants at that point.

The problem of crossing the Mississippi River with an overhead line was an undertaking of some magnitude and had many engineering difficulties. At that time a 138,000 volt cable was not practicable. Since then there have been some installations, but it would have been impossible at that

6040 time and we did not want to go into a cable circuit, anyhow, for other reasons.

—2,597—

The situation at this river crossing was that of a span of almost a mile, some 4,800 feet leading from a high bluff to a flat valley land on the other side, and with a requirement of high clearance over the river. Due to the ice and load conditions, it probably can be stated as having to support six wires and an overhead ground wire at a height on one
6041 side of the river of 300 feet approximately and be able to sustain a breaking load of 60,000 pounds per conductor, so it became quite a problem.

As a matter of fact, we spent $125,000 on the foundation before we got out of the ground for that one tower and the total crossing ran in the order of $180,000-some. We had many things to overcome and decide.

In those days the X-ray method of determining whether metal had any flaws in it was not available. That is a recent development in the last three or four years.

Q. What is the sag in that span? A. I cannot state that
6042 exactly, but I think we are required to maintain 90-some feet above the river and the maximum point is about 300, so it sags down very rapidly.

It is carried over the top of the suspension tower on the Illinois side of the river and balanced over that tower and carried on again into the next span until you get below the low point at which point it is anchored.

Each of these conductors is a very large cable and they are made up of what is known as bridge sockets on the end, just the same as the method by which a suspension bridge is

—2,598—

carried and requires hoisting with a hoist or single wire up to the tower and it took the combined efforts of two boats to drag this single wire across the river against the high wind that came up at the time.

We had the additional problem that this windstorm continued and we were unable to get a man up to the tower. No one could climb the tower against that wind, and we had to let the line lie in the river all night, although that was a fundamental rule for the job, that that conductor must never be allowed to rest in the sand. We could not help it. 6044

The next day we underran the conductor with a pulley and boat to go across and got it out without damage and were successful in getting it up on that tower.

Altogether it was a rather difficult project. We made every part in duplicate and broke one part in a testing machine and assumed that the other one was equal, because the stresses were right at the limit of the best material we could get.

At the time, I believe it was the longest span in the world and I believe it still is. I know it is longer than the St. Lawrence River span which failed, and also longer than the Carquines River span. It was straight and had one lock span on it. These are the three longest in America. I do not know anything about the European record. 6045

(Discussion off the record.)

—2,599—

Q. Now, Mr. Stokes, state if you will the length of line from Cahokia to Crystal City and its voltage? A. Cahokia to Crystal City is about 20-some odd miles. If you take it clear through to Crystal City it is 30.84, and that conductor in there is 300,000 cm., A. C. S. R.

Q. And how many circuits are there on that line? A. There are two circuits on this transmission line, and they continue from Crystal City on to Rivermines.

Q. Before we get on to that continuation, the voltage if you will of the line from Cahokia to Crystal City? A. 138,000 volts.

Q. And that line is of steel-tower construction? A. It is, a steel-tower line with the conductors, as stated, operating at 138,000 volts at the sending end. This is one continuous
6047 circuit as far as voltage is concerned, that is it runs right straight from Osage, by Rivermines at which point there is a switching station, on by Crystal City at which point it is tapped for local service and the glass company located there, on up to Cahokia. But the line itself was constructed at different intervals, and has a different grade of construction at each section.

Q. Now comparable information, if you will, for the portion of the line running from Crystal City to Rivermines? A. That line was constructed just shortly before the Osage project was put in. It was put in service in 1930. It is a
6048 —2,600—
little heavier steel-tower construction than the section between Cahokia and Crystal City, but otherwise, rather similar.

It has 4/0 copper conductor, 211,000 cm. This particular conductor used was seven strand. An ordinary conductor is usually 19 strand. This was a slight economy in this seven-strand conductor, and it was a little more rugged. The length of that circuit is 27.6 miles, and that brings us to Rivermines.

6049

Q. Now the voltage of that line is what? A. That is 138,000 volts. All of these circuits are connected to each other.

Q. And how many circuits are carried? A. Two.

Q. And the construction is again a steel tower, is it not? A. Yes, a little heavier, as I said, than the Crystal City line.

The distance from Rivermines to Osage I do not believe has been put in the record. It is 119½ miles, and it is the power line which was under extensive discussion here with the steel tower, swinging wood arm construction. The con- 6050
ductor there was rated 250,000 cm.

Q. And the voltage? A. 138 kv.

Q. And the number of circuits? A. A double circuit, steel tower line.

Now, I don't believe that I have quite completed what I

—2,601—

meant to bring out. There were one or two other circuits that I should have included in a little more detail.

I have particular reference to the transmission line between Cahokia and Venice. This is a very short line, only 6051
4.81 miles in length, operating at 66,000 volts, 60 cycles, and is a double circuit steel tower with 350,000 cm. copper conductors. It is a very heavy type line, and was constructed under rather difficult conditions. There were many obstacles. The average height of this line is about 170 feet to the bottom wire. That had to cross two or three bridges, go over some river structures, and then some of the tower foundations had to be designed for river current, under high water conditions. Its application is very important because it is the main tie line between the Cahokia and Venice plants.

6052 The insulation of that line is adequate for somewhat higher voltage, and the factor of safety is very good. The operation of that circuit has been very satisfactory.

Q. And that line was placed in service in what year? A. That was placed in service in 1927.

Q. Now, there appear on Exhibit No. 51 certain other transmission lines which I don't believe you have described in detail, one line is a line running from Venice to Alton. Will you give comparable information as to that? A. The
6053 Venice-Alton circuits extend northward from our Venice plant to a town known as Alton, Illinois, a distance of 16.56

miles and consists of a double circuit steel tower line operating at 66,000 volts. It was originally constructed with 3/0 A. C. S. R. conductors. The load grew so heavily, due to some large industrials in that district, as well as the normal growth, that we had contemplated building another circuit.

Calculations were made, and showed that the factor of
6054 safety in the line as designed was fully adequate for 4/0 copper conductors, whose diameter is practically the same as 3/0 A. C. S. R., and which did not change the wind loading on the line. The vertical weight of the 4/0 conductor was not of any consequence in the design, and the breaking strength was only slightly higher than the original conductor.

The result of all of these calculations was that we recently completed, within the last two months, changing the conductor on those circuits from aluminum of moderate size to the larger sized copper, and by that means were able to add 15 or 20,000 kilowatts of available transmission capacity in

that district at a cost much lower than the construction of a new circuit.

Furthermore, the available right-of-way in that district is practically limited to one more circuit, and it is important to us to get the most power we can out of the present two circuits before we use up that last available space. It is becoming very difficult to get a line in there.

Q. And the line is presently of what size? A. It is pres-

ently 4/0 copper, having recently been changed. 6056

I do not have to refer to notes particularly on these lines, because I had charge of the design and construction of the Cahokia-Crystal City line, the Venice-Alton line; I cooperated in the design of the Crystal City-Rivermines line, and controlled the design of the Rivermines-Osage lines, although the construction of those lines was done by the contract. So that part of the transmission system is one with which I am very familiar.

Q. Now that line to which you have just referred is a steel-tower construction line, is it not? A. It is.

Q. And it was installed in what year? A. The Venice-Alton line was installed in 1927. I gave the length and the year. We have two other circuits leading east from Cahokia, which terminate at a town known as Belleville, Illinois. Our ownership of those circuits extends to a town called Centerville. They carry a rather heavy load and consist of double-circuit steel-tower construction, very similar to the Alton line just described. They are operated at 66,000 volts. The length of the line included in our property account is only 4½ miles. They have two circuits of 4/0 A. C. S. R. 6057

6058 *Stanley Stokes—By Respondents—Direct*

Q. And the line to which you have just referred is shown on the map, is it, as running from Cahokia to a point designated on Exhibit 51 as "B-4"? A. That is correct. That

—2,604—

happens to be the limit of our certificate of convenience and necessity for distribution at that point, and it goes on into the territory of the adjacent company.

We have fairly completely described now, as a summary, the Osage-Page circuits, which were two separate single cir-
6059 cuit lines; the Osage-Rivermines, which was a double circuit, steel tower, swinging arm line; the Rivermines-Crystal City, which is a double circuit, steel tower line, and the Cahokia-Crystal City line which is also a double circuit steel tower line.

—2,605—

That takes us around the circuit of the Osage lines. We have also described the Venice-Alton lines, and the Cahokia-Centerville lines.

We also mentioned and described the short line between Cahokia and Venice, which was the heavy tie circuit between
6060 plants, a double-circuit, 66 kv. steel tower line.

A This leaves us with perhaps a little more detail to be added on the 25-cycle Keokuk circuits. Those have been mentioned several times, but the detail of construction has not been fully covered at any one place, although I believe it has been pretty fairly covered as a whole.

Q. All right, very briefly, if you will. A. I would like to summarize it, if I may, in order to get it into the record in one place.

The Keokuk-St. Louis line, placed in service in 1913, consists of a double-circuit, 110,000-volt, 25-cycle transmis-

sion line, approximately 143 miles long, with 300,000 cm. copper conductor, connecting Keokuk and St. Louis.

At a point called Meppen on this line, there is a sub-station, and the voltage is stepped down from 110,000 volts to 66,000 volts, and carried to Alton by means of the Alton-Meppen circuit. This was constructed in 1914, it is 28.7 miles in length, has one circuit, steel tower construction, and 2/0 copper conductor.

That circuit extends from Meppen, as shown on Exhibit 51, over to Alton, and thence on to the Lake Avenue sub- 6062

station in East St. Louis.

Q. The terminus, I take it, of the line from Alton to Meppen, is the point shown on Exhibit No. 51 by the symbol C-8? A. Yes. The other terminus of it, after it passes Alton and goes on to East St. Louis, is Lake Avenue, which is shown as a square representing a sub-station, and the letter "B" indicating ownership by the Union Electric Company of Illinois.

This Keokuk line was put in at the early date of 1913, 6063
and was at that time the highest voltage transmission line, I believe, anywhere in the Middle West. Central Colorado had a line of that voltage, and I believe there were some in the South. At any rate, the insulators and all of the various features of the line were rather new and experimental. We will describe later the fact that we cooperated to some extent in the design of those insulators, or our predecessor company did, and they were known as the Keokuk insulators. Over 50 per cent. of those are still in regular service today, and have proved very satisfactory after all of these years.

6064 *Stanley Stokes—By Respondents—Direct*

There is another interesting application on that line known as the Nicholson arc suppressor. This device, which I believe has been largely discontinued on 60-cycle circuits, has functioned very satisfactorily over many years on the

—2,607—

25-cycle system, and the service rendered by this Keokuk line has been remarkably good.

One reason for that is this, that the length of time in which the 25-cycle oscillation passes through zero of the
6065 current wave, and by that I mean if you alternate a current 25 times a second, you take a longer period in passing through the zero part of the wave than you do if you have an oscillation 60 times a second. And that difference is just enough that, with long lines, it is very frequent that if there is a flash-over due to lightning, that the arc goes out at the first zero part of the wave, and the service is not interrupted, and the only way we know that it existed is because we have certain recorders mounted along the line.

The question was raised repeatedly as to why that Keokuk line gave better service than some other circuits which we
6066 thought were better constructed, and the solution turned out to be that it was because it was operated at 25 cycles, it had certain peculiar characteristics. This Nicholson arc suppressor is a device on the roof of the power station at Keokuk, which, when a ground goes on the circuit, due to lightning or any other difficulty, it operates a contactor, shorts that particular wire to ground, and immediately blows a fuse. This fuse is something on the order of 10 or 12 feet long, and this structure on the roof is a circular device about 15 or 20 feet high and 10 feet in diameter, and has a series

—2,608—

of these big fuse tubes, arranged in a circle, and it rotates and a new one comes into position. The purpose of the thing is that on the application of a sudden ground, if you can suddenly short the line ahead of that ground, the arc will go out, and then you remove the ground through your fuse.

Well, sir, the operation of that device has been such that we have kept it in service all these years, and still intend to do so. It is not considered a modern device, but on that particular system it has demonstrated that it is very effective. 6068

The recording device to which I have referred was rather novel. We have overhead ground wires on that circuit, and the lightning usually strikes them, and we arranged an ammeter device connected in the lead that carries the overhead wire to ground, and it records any current flowing down that lead. With that, we can tell where the lightning stroke was, and if there is any trouble, the patrolman can tell immediately, by looking at these ammeter charts, what section to go to. It is such a long line that if you can save delay it is worth while. There is usually no interruption of service whatever due to the loss of one of the Keokuk circuits, and 6069 we have supplied all service with the loss of both of them.

We had a tornado some years ago and it took out about a half a mile of the Keokuk line, along with other buildings and threes, and the service was interrupted for a very short

duration, and we picked up the load at our end, and they picked up the Keokuk load at the other end, and the disturbance to the system load was minor, although the line was taken away entirely.

6070

That repair was made under flood conditions when the river was up 10 miles on one side out of its banks, and altogether it was quite a difficult repair job.

But the facilities available, which prevented that thing from being a real disaster, were all that saved the day. We have had other experiences with tornados.

Now the Page-Venice circuits, or Venice-Page circuits, either way (we usually refer to them as the Venice-Page circuits), consist of two 66,000-volt underground cables, carried
6071 as submarine cables from the Venice plant until we get across the river on the Missouri side, and thence through conduit to the Page Avenue sub-station.

Cables of this voltage, and particularly of large capacity, these being 750,000 cm., copper, represent a real cable problem. First, the static head that exists from the time you leave the power plant on the level of the ground behind the levee, until you get down to the bottom of the river, is some 40 or 50 feet, minimum, and that much pressure on a cable causes the oil to migrate. These cables have oil in them. It also puts some stresses on the lead sheet—all of which have
6072 to be carefully anticipated and taken care of by various means.

—2,610—

The pot-head problem at the terminal of this submarine cable is rather a severe engineering problem, although it has been solved all right. I wouldn't say we have had perfect service with those cables, because there have been mechanical damages. We don't know in all cases what did it, whether it was a bolt or what, but two of them have been mechanically damaged, and have had to be replaced. I should say those

are single-conductor cables. All of our other cable system is three-conductor cable, in which all three conductors are separately insulated and enclosed within an insulating layer, and placed within one lead sheet. These are single, and it takes six of them to make up the two circuits.

The land section has some problems in the manholes, where you have to make joints, to be sure that the oil reservoirs and all of the equipment that goes with it are properly done by the man who does the work, together with the fact that they must be at all times free from moisture. Hot oil 6074
has to be poured over these joints all the while they are made, so that no moisture from the atmosphere can get into them. Finally, we get to Page Avenue, where these cables terminate in two transformer banks, one for each circuit, 50,000 kilowatts each, and these banks are equipped with load ratio control equipment, which permits the voltage to be adjusted automatically, or at the discretion of the operator.

This adjustment of voltage at the two ends of these cable

systems, and again at Rivermines, Missouri, and again at Cahokia, and in our new plant at Venice, permits us to do 6075
what is equivalent to tilting the rating on these lines in either direction. If you could think of my having a little trough of water, if I wanted the water to flow that way, I would tilt it this way (indicating), and if I wanted to have it flow this way (indicating), I would tilt it that way (indicating).

Now in that case you can control the flow of kilowatts by the governors on your steam turbines, but the flow of the kilovars, or reactive energy, is determined by voltage conditions, and if you want to control that flow you must have

control of the voltage, and if you want to reverse the flow of power over a circuit of a magnitude of that character, with an ordinary circuit without load ratio control, there would be a voltage drop from the transmitting end to the receiving end. Then, if you start at the receiving end, the voltage taps now having been set lower here than they are here, (indicating), you might start out at Osage, for example, with 141,000 volts, and deliver at Page Avenue 132,000. Then you would start at Page Avenue and go back,
6077 you would start at 132 and wind up at Osage at something like 120.

Now that problem exists throughout any power system where power has to have a reversible flow, and in order to make the system work successfully, and not be limited to a lot of problems that you can't control, this load ratio

control equipment is used at a number of points.

Those Venice-Page circuits have given us very reliable service, and they are very important in our system, because they do connect our major steam plants with both of our
6078 hydro plants.

Q. Now the length of that line is what? A. That is about 7 miles. The exact length is 7.94 miles.

Q. And the year in which the line was placed in service? A. 1930 it was placed in service.

I think I have now described what I would consider to be the more important high voltage circuits. We have many other circuits which are of great importance, operating at lower voltages, and certain of those will be described under what I would call our sub-transmission system.

6079

Q. Now you have given us a number of figures on the size of the conductors, variously from 250,000 cm. on up to as high as 750,000 cm. Now, will you translate that in simple terms to indicate whether those conductors are of considerable size or whether they are small, or whatever nature they may be? A. We regard all of those circuits as being what are known as heavy-powered circuits, and can express the idea by saying that any of them can transmit, from 50,000 kilowatts up, at will. Even with these cable

—2,613—

6080

circuits which we rate at 50,000 kilowatts for continuous operation, we wouldn't hesitate to put 100,000 kilowatts on them for a few minutes.

For example, we actually operate the Venice-Page cables at 50,000 kilowatts per circuit whenever we want to. If one of those were to trip out, the other circuit picks up the full load, whatever it may be, whether it is 75,000 or 100,000, for the length of time required for the Osage plant to come in and take the load.

6081

So that the Osage-Page circuits are limited, not by the current-carrying capacity of the conductors—those conductors which were listed as 336,400 A. C. S. R. are equivalent to a 4/0 copper in carrying capacity, aluminum having about 60 per cent. of the conductivity of copper—but the limit on the Osage-Page circuits is what is known as a stability limit, and is a measure of the amount of synchronizing power or torque, if you like to look at it in that way, that you can transmit over a transmission line.

Those problems do not arise until you get some length in the circuit. To illustrate the thing as simply as I can,

6082 *Stanley Stokes—By Respondents—Direct*

if you regard a slender steel shaft as being twisted from each end, there will come a time at which it will break, and in the electric parlance, the breaking point is when the machine at the sending end pulls out of step with the generator at the receiving end. Previous to that, they are running in synchronism, each one keeping together with the other, and

—2,614—

you get a sudden short-circuit somewhere, and one machine may plough right ahead, and pull out of phase with the other
6083 one.

Before you reach that limit you will have to be sure that you either keep your load down or provide sufficient high-speed switching that you can clear the circuit quickly and rely on your others, the stability limits being a function of the speed with which you can clear the circuit after trouble starts.

The Examiner: Let us have a short recess.

(Whereupon, a short recess was taken, after which the hearing was resumed.)

6084 The Examiner: Let us proceed.

The Witness: Although we have completed the description of the Osage-Rivermines transmission circuits, I would like to mention that the type of structure being original, and the length of the line being considerable, and the importance of the job rather great, it became necessary for us to do a considerable amount of research work, involving laboratory testing, the design of clamps to hold wood, and calculations with regard to the probable loads on the wires, and

many other factors. So that, altogether, it represented quite a little development work.

By Mr. Hamilton:

Q. Is bulk power tapped off the main transmission line

—2,615—

at various points? A. Yes. If you refer to bulk power as meaning a sort of a wholesale point at which power is sold or delivered in a large quantity at one point, we do tap this Keokuk-St. Louis line at Hull sub-station, which is shown 6086
on Exhibit 51 at the point marked Hull, shown as a red square with a "C" alongside of it, and the terminus there is shown as "C-6". That is opposite the town of Hannibal, on the Missouri side. At this point there is a step-down sub-station and circuits are originated, one of which comes over across the Mississippi River to a point marked "C-5", —anyway, that is Ilasco, the end of that short extension, at which location there is a large cement mill. That circuit supplies that, and also supplies a neighboring utility at that point.

That was covered in the testimony previously given. 6087

The capacity of that station is largely required, however, for the Central Illinois Public Service Company, most of whose load lies 15 or 20 miles north at the town of Quincy, which is also shown on the map.

I would like to give some capacity figures for the size of that sub-station, if I may. I may not have it readily available, although I have it in some of my notes.

Q. I think we can get that later. A. I will get that a little later. I think it is approximately 34,000 kilowatts.

—2,616—

6088 *Stanley Stokes—By Respondents—Direct*

The line from Keokuk to St. Louis is also tapped at Meppen, and that was mentioned under our transmission discussion. I think the capacity of these various stations will be brought out better under the discussion of sub-stations than under the transmission system itself, although at our Page Avenue sub-station we have some very important transformer banks, and they were listed in total, and while some of them have been mentioned individually, I do not believe that we have summarized the groups as a whole.

6089 I would like to get those figures in, because I consider the Page Avenue sub-station to be a transmission station rather than an ordinary distribution station.

We have at that location: two 110/13.2 kv., 37,500 k. v. a., 25-cycle transformer banks. The terminology is the same for the rest of them.

Two 132/13.8, 56,250 k. v. a., 60-cycle transformer banks.

Two 66/13.8 kv., 56,250 k. v. a., 60-cycle transformer banks.

Three 33/13.8 kv., 13,333 k. v. a., 60-cycle transformers.

One 33/13.8 kv., 12,000 k. v. a., 60-cycle transformer.

6090 Three 33/13.8 kv., 10,000 k. v. a., 60-cycle transformers.

Three 13.8/4.5 kv., 7,500 k. v. a., 60-cycle transformers.

The point of interest there is that the Osage circuits, which come into Page Avenue, are stepped down from 132,000 volts as delivered to the 13.8 hundred volt bus, and then stepped up again to 66 kv. for delivery to the cables that go

—2,617—

to the Venice plant. The reason for that is this, that there is no common utilization voltage at Page Avenue, no one voltage that you could select that would do the job, because you have the various requirements.

6091

Consequently, we selected the bus voltage at the plant as being the most suitable for switching, just exactly like a power plant selects its bus voltage and transforms everything to that.

Various other methods were considered, and that was decided on as the best.

Now at the Cahokia plant, the transformer equipment in the yard adjacent to the building consists of two 132/66 kv., and two 66/13.8 kv. transformer banks, the first pair being 56,250 k. v. a., and the last pair 62,500 k. v. a. Those are 6092
large transformers. They connect Cahokia north onto the transmission circuits going to Venice, and south and west onto the transmission circuits going to Crystal City, Rivermines and Osage.

Q. Now is the transmission system so designed that bulk supply centers on the system may be fed from two directions? A. The general design of our system uses more duplicated circuits and less loop circuits than many companies. Loop circuits are usually cheaper in some ways, but at the time of trouble, the trouble is actually on the same circuit on which

—2,618— 6093

you are trying to deliver the load until you get it opened. That is, a loop circuit clears upon opening an oil switch at some place, and the remaining part of the loop carries the load. If those two circuits were not connected at all, one would not be involved in the trouble on the other. The performance is about identical if the switches work all right. If there is any failure on the switching equipment, the two separate circuits give a little better grade of service. We have no objection to either one, but all of these bulk or large,

6094 important centers are supplied with duplicate service, whether obtained by loop methods or by independent circuits.

Our system generates its own power, and we buy, I think, no power from other sources.

Q. Are the overhead transmission lines designed to withstand ice strain and high winds? A. Yes, we are located in what is classified as a heavy loading area, and we design our circuits to withstand the customary ice and wind loading conditions of what is known as a Class B loading system, one-
6095 half inch of ice and an 8-pound wind at the same time. Then, for our important circuits, we allow a 50 per cent. overload above those figures. There is a very weak spot in the specifications in the National Safety Code with respect to the design of steel tower transmission lines, and it has to do with the fact that there is little, if anything, said about the number of broken conductors for which you should design. —2,619—

Now the chief strain on a tower occurs at a time of a broken conductor. So that if we were to design a tower for Class B loading and no broken conductors, we would have a
6096 relatively light design. If, on the other hand, I were to design it for three broken conductors in one circuit, I would have about the heaviest design that could be used on a straight line or tangent tower. Our practice is to design an anchor tower or a dead end for all broken conductors on one side of the tower. By "one side", I mean looking in one direction down the line. That is the worst possible condition that you can put on a dead end tower. Also, designs for one broken conductor in one circuit of a tangent tower, and two broken conductors or the equivalent, for an angle tower. All

of these designs contemplate the use of a 50 per cent. overload factor of safety.

The Safety Code merely requires that you meet those conditions. In other words that you are about ready to fail.

I believe that general standard of construction is today adhered to by a good many of the large city companies. It is not usually adhered to by some of the smaller groups. I mean by that, that we design a high grade line, but I am willing to admit that other people do very much the same thing today. That statement should be limited now to what would be 6098
regarded as first class metropolitan cities.

Q. Now, are the lines also designed to minimize lightning troubles? A. Yes, I have treated with that to some extent

—2,620—

in connection with the design of the wood cross-arm Rivermines line which was actually tested in a lightning generator laboratory, full scale. The lightning outages have been negligible on those circuits, and from this description you will observe that we have a large number of circuit miles exposed and that the likelihood of trouble is proportionate to the number of miles of line, and that a long line, to give 6099
good service, has to be more carefully constructed than a short one.

The various means of designing a line to withstand lightning, all sum up in one way or another to obtain adequate clearance from your conductor to ground through the air, and by "ground" I mean either a grounded steel tower or a ground wire down a pole, or any other structure, combined with insulating materials which will more than withstand the voltage required to arc from the conducter to that ground.

6100 In other words, for example, if you had a three foot clearance to steel in the normal position of the wire, which used to be a very ordinary design, considered good, you first would have to have insulators of one kind or another, either a combination of wood and porcelain, or all porcelain, which would not flash over at that value, because you do not want the arc going over your insulator string. If you want to get a better performance than that, you want to increase that clearance and use more insulators. That is what we have
6101 done in all of our circuits. We either have a very large

—2,621—

clearance, and a combination of wood, or an equivalent large string of insulators.

That is not altogether true on our earlier lines, although they are duplicated and short, and give very good service.

The improvement in the method of building transmission lines dates from what is known as cathode-ray oscillograph, which provides information as to what the lightning stroke really does, and the improvement in the operation
6102 of these lines is to a large extent affected on our system by the use of the type of oscillograph which is built in the form of a little automatic device, and located at three or four of our strategic points. Those instruments are expensive, about three or four thousand dollars apiece.

Q. Is the main transmission system adequate for present loading and for presently anticipated loads? A. Yes, it has considerable leeway in the matter of capacity. We might illustrate that by the loadings that occur on the transformer banks themselves at times of peak loads.

6103

A transmission line is nothing but a piece of wire, and if the distance is moderately short, not over 50 miles or something like that, you could keep on running the load up on that until it gets hot, and it wouldn't really fail on you until you have passed the annealing limit of the copper, and that point would be a load clear above the economic or practical voltage drop and energy loss limits. Hence, no

—2,622—

transformer bank is ever installed for that high rating on the wire, and the limits of these transmission lines are the 6104
practical voltage drops in the line, and the limiting capacity is always determined by the transformers.

In this particular example which I would like to give, I can illustrate the system peak which occurred at December 12, 1939, and amounted to 476,000 kilowatts, and show how it was distributed on different banks of transformers, and determine what percentage of their capacity was being used.

The Page transformers, supplying the Page-Osage line, have a load of 41,000 kilowatts or 43,700 k. v. a., with an installed capacity of 112,500, and was operating at 38.8 per 6105
cent. of its capacity at the time of the peak. Similarly, the Page-Venice transformer at Page had a load of 12,100, 14,300 k. v. a., and a capacity of 112,500, and was carrying 12.7 per cent. of its rating.

The Page-Keokuk transformer at Page had a load of 9,000 kilowatts, a k. v. a. of 9,500, and an installed capacity of 75,000 and was running at 12.7 per cent. of its rating.

Now that is due to the winter load conditions in the hydro plant, that is not the season of the year in which that

transformer would be carrying the largest load. At some other time, it would be loaded more than 12.7 per cent.

Rivermines transformers have 24,000 kilowatts, with 31,000 k. v. a., and installed capacity of 60,000, and was running at 51.6 per cent. of capacity. —2,623—

Q. I don't think you need to detail the load on each particular transformer. Will you indicate the range? A. That illustrates the method used, and I will give the range by saying that the maximum load on any bank came on the
6107 Cahokia main sub-station transformer, which had a watt load of 110,000, a k. v. a. load of 110,000—that power factor by the way would be corrected to unity at the time—and had a capacity of 125,000, and was operating at 88 per cent. of its rating.

So the range there, the highest load was 88 per cent., down to a normal loading there of about 35 to 23 per cent., in that range. Those two extremely low loadings there were due to the fact that that is a hydro transmission circuit, and this particular date was during the light load period. I
6108 think I could generalize and say that we could readjust loads there and safely carry 50 per cent. or more load above that which we had at the time.

Q. Now would you state whether the addition of the new units at Venice have any effect on the adequacy of the transmission line, or whether they will have? A. Well, we will have to buy new transformers for the Venice plant, but the transmission lines will be adequate. We will have to provide some additional feeder circuits at 33,000 volts, but the main high voltage transmission circuits will still have ample capacity. —2,624—

Q. Will you state what you regard as being the contributions to the transmission art which have been made by the Union Electric Group in the development of its main transmission system? A. Well, a little at a time, throughout this testimony, I have mentioned some of the features which we have developed, among which was the swinging arm wood transmission line. I mentioned briefly the Mississippi River crossing which was an improvement in that particular type of work in many ways over anything that had been done.

The insulators for Keokuk, for the Keokuk lines, were 6110
a special development. We can't personally take any credit for that, because that occurred prior to the time that we really owned that property, but we now own it and those same insulators are still giving service. That work was done with our knowledge, because we were interested in the type of service we were going to get over that circuit even then, but we had a contract to receive the power from the Keokuk company. That was the Mississippi River Power Company which is now a subsidiary of the Union Electric Company of Missouri.

We have installed a very complete communications sys- 6111
tem, and it largely consists of carrier current telephony on these transmission lines, and some original work was done by us on it in the early development of that particular type of communication. The majority of that development work was carried on by the other parts of the North American System.

—2,625—

We built an experimental line which operated between St. Louis and St. Charles, Missouri, and transmitted information over this so-called carrier current back in the early days of its development. That was purely experimental, however,

and was not continued in service. Our present equipment is built by the regular suppliers of that type of equipment, but installed by ourselves, and due to our familiarity with the requirements of carrier current communication, the successful operation of the equipment has been much above average.

For example, we can talk successfully from Keokuk to Page Avenue, 143 miles, on from Page Avenue, on another circuit, having stepped down from the first one and coupled up to the second one, on to Osage—another 138 miles, and
6113 from there on to Rivermines, another 120 or 125 miles, and carry on a satisfactory conversation throughout that entire length. That is not essentially normally in regular operations, because most of the communication is between the various plants and the city load dispatcher, but as a matter of information we can talk the other way readily.

The developments of the St. Louis group are rather considerable in the cable part of the system, but the large amount of that work is done at the lower, 33,000 volts, and will be discussed under our general system of sub-transmission cables. —2,626—

6114 There is one other feature that has contributed a great deal to the successful operation of our circuits, and that was the extension of the use of the wood insulation in the poles and cross arms to that of guy insulators. It was found that a great deal of the trouble on transmission circuits, as well as distribution circuits, came about by reason of lightning flashing from one of the conductors to the guy that was holding the pole, and by inserting a long eight or ten foot wood strain insulator, we were able to improve the operation of those circuits.

6115

One feature of transmission design which has not in the past been practiced, but which we carried out carefully on the Osage circuits, was the exact measurement of ground resistance for each power before any ground wires or other connecting devices were applied, and if any tower or pole did not come up to a predetermined low value, additional ground rods or other precautions were taken to insure low ground resistance. It had not been appreciated in earlier years, the importance that low ground resistance on a transmission line really amounted to. What we found out was 6116 that with a heavy stroke of ligthning which conceivably can readily reach 100,000 amperes down a tower for a few millionths of a second, that that can cause the whole tower to rise up above ground potential. I will explain that with an example. Suppose we have what is very frequently a good value of 10 ohms ground resistance, in other words between the tower itself and ultimate earth potential, which may

be many feet in the ground, an equivalent value of 10 ohms exists.

6117

100,000 amperes, flowing down through 10 ohms would produce a million-volt drop, and that drop would cause the tower, the earth being at zero potential for example, would cause the tower to suddenly assume a potential 1,000,000 volts above ground for that fraction of a second.

Under those conditions, the conductors which have quite a bit of electrostatic capacity to ground would remain fixed relatively with respect to ground, and the tower would flash to the conductors—and that turned out to be the explanation of a large percentage of the double-circuit faults in which

6118

they really held the conductors at practically even potential because of their condenser effect to ground, and suddenly shot the tower up for just an instant and it went over to the conductors and that naturally would affect them both.

—2,628—

Well, all of those things represent just added information with respect to the art, and what we try to do is to apply them as quickly as we can do so to get results.

6119 The operation of all of those circuits I have mentioned, particularly the Osage-Page, and the Osage-Rivermines, have a record which is very good, indeed.

Q. Is this testing conducted in your own laboratory? A. No, that is conducted in a regular professional testing laboratory, where they have these machines for pulling wires, and so forth. We do not ourselves own that kind of a laboratory. There are three such laboratories, regular commercial laboratories, available in St. Louis for ordinary commercial testing. They were primarily installed for such things as buildings, and concrete design, and testing of things like that, but they
6120 are equally applicable to what we want to do. We could also make those tests in any one of the university laboratories which are available to us as well. We wouldn't have enough continuous testing to justify the investment in a major testing laboratory of that kind. The mechanical people who design buildings and things like that, really have more occasion for these laboratories, they are always testing concrete or something else. So they have found it feasible for several of these commercial firms to operate a laboratory for that purpose.

We do our own work in this testing, utilizing the facili-

—2,629—

ties of this commercial laboratory.

Q. I believe you spoke of a lightning generator in connection with a description of the testing. What is that? A. Well, that is a device to produce artificial lightning on a relatively large scale. Anyone who saw the General Electric exhibit at the World's Fair has really seen the largest one so far built.

It is a series of condensers or capacitors, which can be 6122
charged at moderate voltage from a vacuum tube generator, in parallel. Think of a lot of small units, in order to keep them from flashing over to ground later, and they spiral them up like a spiral stairway, and if you can think of an insulated spiral stairway with a great big block of capacity sitting on each step, and if you had means of charging those devices from a vacuum tube generator in parallel, and then by a trick circuit, discharge them in series,—voltages build up and add directly in series, currents add in parallel. For example, if you had a thousand of those condensers and each one was good for 10,000 volts, then you would have to have 6123
a 10,000-volt charging generator which could put current into all of them in parallel. Then when you discharge them through a gap, and a peculiar circuit which is too complicated to go into here, but rather ingenious, all these condensers discharge in series, and the voltage builds up the product of the number of condensers times their individual voltage. In the example I used, that would be 1,000 times 10,000, or

—2,630—

10,000,000 volts, which is about what that World's Fair generator is.

6124 This particular test we made was made in the Westinghouse laboratories, but there are two such generators available, and these smaller manufacturers now have smaller ones for lower voltage testing. They are very effective to determine what happens if lightning strikes a tower. They have gotten them up to pretty good capacity. They can take a stroke of lightning, maybe 15 or 20 feet long, from one of those generators, and strike a block of wood a foot square and 6 feet long, and shatter it into a hundred pieces, and it
6125 will fly all over the room, just with one stroke.

That sort of thing was of no value until the cathode ray oscillograph was available to measure the voltage actually obtained, and then out on a transmission system, various devices have been installed on the towers to get an idea of how much current flows down those towers, little magnetic elements that are either magnetized or demagnetized by lightning, and you get a relative idea from those as to what the currents were, going down the tower; and knowing the value of your ground impedance, or resistance, which you can measure, you determine to a certain extent the probable
6126 voltage of the lightning, and that, then, is duplicated in the lightning generator in the laboratory.

The interesting thing about our particular swinging-arm

—2,631—

towers on this test was that the calculated value of flashover, including a combination of insulators and a certain amount of wood, came out as we had predicted. We were rather surprised and pleased that it did, but the voltage drop across an insulator string, and across a piece of wood, do not add up directly.

If I had a 1,000-volt drop across an insulator, and a 1,000-volt drop across a wooden arm, my total would not be 2,000, and knowing something about that, we had made allowances for that, and the results of the test were about as expected, and the flash took place from the conductor across to a point on the arm about 5 feet from the tower, which is about where we predicted it should.

Q. So that in perfecting the transmission line design, you conduct laboratory experiments to simulate conditions to which the line itself will actually be exposed in operation? 6128
A. That is right.

Q. Do you actually construct your transmission lines yourself, and by "you", I mean the Union Electric Group? A. We do it both ways. We constructed the Alton lines ourselves, the Cahokia-Centerville lines, the Cahokia-Crystal City lines; and because of the Osage project, and having Stone & Webster engaged on it, these other lines were constructed by them, I mean the Osage circuits, although we carried out the design jointly with them. The actual construction was carried on by contract.

—2,632— 6129

Q. How about the crossing of the river at Crystal City? A. We did that work ourselves.

Mr. Hamilton: This represents a good breaking point, Mr. Examiner.

The Examiner: All right, we will recess until 10 o'clock tomorrow morning.

(Whereupon, at 4:30 o'clock p. m., a recess was taken until 10 o'clock a. m., Wednesday, October 23, 1940.) —2,633—

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

6131

Hearing Room 622,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Wednesday, October 23, 1940.

Met, pursuant to adjournment, at 10 o'clock a.m.

6132

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD and ARTHUR J. BUSWELL, Attorneys for the Securities and Exchange Commission.

PROCEEDINGS.

The Examiner: The hearing will come to order.

Mr. Hamilton: Mr. Stokes, will you resume the stand?

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued): 6134

Q. Yesterday, Mr. Stokes, you described the main transmission system of the Union Electric Group. Will you now describe the sub-transmission system and begin, if you will, with a statement of what you regard as being your sub-transmission system? A. The sub-transmission system, as referred to in this discussion, consists of the lines which form the connecting link between the main transmission system and the main power plant, with the distribution sub-stations. Those sub-stations are step-down transformers stations in most cases, which step the voltage down from some voltage such as 13,800 or 33,000 volts, to a lower distribution voltage, such as 2,300/4,000, or in some cases 6,600, 6,900, and other similar voltages. That is, we have several such voltages in approximately the same range. 6135

The sub-transmission system of the Union Electric Company Group is a combination of overhead lines and underground cables. The system includes more than 1,200 circuit

—2,635—

miles of both overhead and underground transmission, divided into 543.8 miles of 33 kv. pole lines; 43 miles of 33 kv.

steel tower lines; 159.7 miles of 33 kv. submarine and underground cables; 170.4 miles of 13.8 kv. submarine and underground cables; 248.2 miles of 13.8 kv. pole lines; 6.8 miles of 13.8 kv. steel tower lines; 1.6 miles of 11 kv. steel tower lines; 34.2 miles of 11 kv. pole lines; 9.1 miles of 11 kv. underground cable; and 18.5 miles of 6.6 kv. underground cable. These mileages are in addition to those lines which have been previously described as main transmission system.

In general, the underground system, so-called, meaning
6137 the underground cable and the conduit work, is confined to the urban and the more densely populated areas, while the overhead circuits serve the surrounding, lesser populated districts.

In general, the City of St. Louis is largely supplied by underground cable except for its 4,000 volt ultimate distribution circuits, which are not under discussion here.

St. Louis County has both underground cable and overhead lines, I would say predominantly overhead. The other less populated districts have a larger percentage of overhead construction.

6138 The general basis of these circuits is to supply off them 60-cycle energy for practically all of the growth of the load. Certain areas which are already supplied by 25-cycle for in-

dustrial purposes or railway load, are continued that way.

Q. Now, if you will, describe that portion of the subtransmission system in and about the Keokuk plant? A. The Keokuk voltage at the plant is referred to as 11 kv. Most of our system is 13.2 or 13.8 kv. I would like to explain that in the use of these voltages that are very close to each other,

such as 13.2 or 13.8, or 66 kv. or 69kv., those are all used synonymously. Actually, the voltage varies on such a circuit, and at the transmitting end the voltage would be somewhat higher than at the receiving end. So when I speak of 13.8 kv. cables, I am talking about the power plant end. If I speak of 13.2, it merely means that we are talking about the receiving end. But in any case, they may be regarded as synonymous.

The Keokuk sub-transmission system takes the supply of power at 11,000 volts from the plant and distributes it in 6140
the vicinity of Keokuk, and by reason of transformation to 33,000 volts, it is also supplied to Fort Madison and other towns in the vicinity.

The two 11 kv. feeders supply 3,500 kw. of frequency changers of the Central Illinois Public Service Company. One 11 kv. feeder supplies a 2,450 kw. frequency changer of the Illinois-Iowa Power Company.

Four 11 kv. feeders go to Hamilton, Illinois, which is located immediately opposite the Keokuk plant on the Illinois side of the river, where two of these four feeders sup-

—2,637— 6141

ply the Illinois-Iowa Power Company; and the other two, the Iowa Union Electric Company.

Three 11 kv. feeders go to the Keokuk terminal for 11 kv. distribution to the Keokuk and Jackson Avenue substations, and numerous customer sub-stations.

The Keokuk terminal is just a name for a terminus, not far from the plant.

Two 11 kv. feeders supply large customers. Those are big industrial customers who are heavy users of electric power for electric furnace application.

6142 Two 33 kv. feeders go to Burlington, supplying nine sub-stations of varying capacities, which are operated by the Union Electric Group. The end of those feeders terminates at the Burlington sub-station of the Iowa Southern Utilities Company. I should explain that that reference includes the line which was discussed under main transmission system, but I have not included it in this mileage. The reason I have mentioned it here is that those various sub-stations which are tapped off of that circuit, were not included in the previous
6143 discussion. They are small stations to a large extent.

In addition to the above feeders, part of the sub-transmission system consists of the taps on the main 110 kv. transmission lines at Hull, and Meppen. Those points were discussed and located in the previous testimony, and in addition to their features as wholesale points, there is some

sub-transmission carried out to supply loads in the vicinity.

At Hull, seven sub-stations are supplied with energy over 33 kv. lines from that point, and in addition energy is sold
6144 to the Central Illinois Public Service Company for use in their own frequency changers located at Hull sub-station.

At the sub-station which taps the main line at Meppen, a 9,000 kilowatt step-down transformer, 110 to 66 kv. voltage, supplies a portion of the power going to the Central Illinois Public Service Company transformers, and frequency changers; and a 66 kv. No. 2 single-circuit line, which is carried to Alton. That line was mentioned yesterday.

At Alton there is located 6,000 kilowatts in step-down transformers. The line then continues to Hartford, where 8,000 kilowatts of transformers are in operation, and thence

to Lake Avenue sub-station in East St. Louis, which is 15.6 miles south of Hartford.

At Lake Avenue, 10,000 kilowatts in transformers supply 25-cycle service in the East St. Louis district, with a reserve supply, over three 13.8 kilovolt submarine cables from the Ashley Street plant. That is, the service in East St. Louis amounting to about 10,000 kilowatts of 25-cycle load in that vicinity, has a duplicate source of supply, and in the event that this circuit from Mappen sub-station were to be in difficulty, the service would be continued without interruption 6146

—2,639—

by cables going from the Ashley Street station under the river and over to Lake Avenue. In that district we have the large packing companies, the National Stockyards, and this service is quite important.

In general, as we go through this sub-transmission system, I should like to point out that the facilities are, in almost every case, if not all, arranged to provide duplicated service; that the extent to which duplicated service is provided in the area supplied by the Union Electric Group is a very high percentage. I think that is one distinctive feature of the 6147 Union Electric system, the extent to which our main customers have duplicated service.

Q. State the purpose of that duplication, if you will? A. The purpose, of course, of the duplicated service, is to render less frequent possible interruptions, and not only minimize the possibility or probability of interruptions, but to reduce the length of time if any should arise.

The success which a power company may have in the long run with these large industrial customers is, in my opinion,

6148 *Stanley Stokes—By Respondents—Direct*

to a great extent affected by the actual continuity of the service rendered, as well as the voltage regulation and quality of service. The fact that electric service may be rendered and be of lower grade is not always appreciated, but it is a fact that in industrial work, particularly, both regulation and continuity are of the greatest importance.

—2,640—

The supply of service by these underground sub-transmission cables is obviously more expensive than to do it with
6149 overhead lines, but the reliability is much higher.

Q. Describe the portion of the sub-transmission system in and about the Page Avenue sub-station in St. Louis, if you will? A. The Page Avenue sub-station has been previously mentioned as a main transmission sub-station, which is its chief function; in addition to that, however, there is a large group of sub-transmission feeders leaving this station, and in addition to that, quite a large building containing a group of distribution feeders which will not be described at this time.

When we constantly refer to the Page Avenue sub-station,
6150 it is because that station contains, in the same general location, all of these facilities.

The sub-transmission feeders supplied out of this sub-station are of considerable importance. The fact is that they are very important. There are ten 13.8 kv. 60-cycle feeders which supply ten sub-stations through 104,500 kilowatts of 13.8/33 kv. transformers; and 13.8/4.16 kv. transformers 25-cycle service, at 13,200 volts is provided by 24 feeders which run to 12 railway sub-stations belonging to the Public Service Company, which is the local street car company, and

some of these feeders go to Ashley Street where they in turn are supplying railway load.

—2,641—

The 60,000 kw. of frequency changers, previously mentioned, are on the bus which supplies all of these facilities, and I would like to make this point, that when some question was raised recently about the possibility of supplying reliable service to what is known as Lambert Field, an airport some 9 miles from Page Avenue sub-station, and I was asked whether I thought we could supply good service 6152
to that point, I said that I could conscientiously reply that if we couldn't deliver it at that point, I didn't believe it could be delivered anywhere. And I have summed up the facilities by saying that we had two hydro-electric plants, four steam plants, several duplicated types of substation facilities, and a group of distribution lines—all available at that point, and any one of which should be able to supply that service many times over.

The extent of these facilities is a matter of real point in this particular system. The St. Louis County area, which is adjacent to this sub-station, contains the highest grade 6153
residential and some of the better commercial establishments in the St. Louis area, including University City, which is the largest single town in that district, and the requirements for service are very severe at that point.

The ten feeders previously mentioned, 7 of which supply energy to transformers having a total capacity of 82,000 kilowatts, which furnish the service for nine sub-stations,

—2,642—

are divided into two groups: seven 33 kv. feeders, and three

6154 *Stanley Stokes—By Respondents—Direct*

feeders supplying the Page Avenue distribution station through 22,500 kilowatts of transformers at the lower voltage delivered of 4,160 volts, three-phase, four-wire.

The statement there is not sufficient to make it clear. The seven 33,000 volt feeders which leave this sub-station, each one having its own transformer, step up and supply 33,000 volt overhead lines which go out several miles in the different directions to supply these step-down sub-stations, which in turn handle the district for such towns as St. Charles, for
6155 example, and various other communities in that area.

The three feeders which I mentioned as going through the 22,500 kilowatt transformers, step down right at the Page Avenue location, and go into this other large distribution building which handles the 4,000-volt distribution.

The 25-cycle sub-transmission circuits from Page Avenue, consisting of 24—13,200 volt feeders, have 8 feeders used as tie-lines to the Ashley Street plant. These are underground cables. Also, ten feeders supplying 12 sub-stations of the Public Service Company, by underground cables. You understand that 10 feeders can supply 12 sub-stations by tap-
6156 ping one feeder to more than one. That sub-station probably has another source of supply from some other location.

Six feeders leave Page Avenue underground, and then are routed overhead, three going north, and three south, to a

—2,643—

number of customer sub-stations.

That is a rather brief summary of a major investment in feeders whose average capacity varies from a minimum of 7,500 or 8,000 kilowatts each, to 12,000.

All of these transformers on those feeders that step up are provided with air-blast equipment which permits the

transformer to increase its rating for emergency operation. The later transformers installed on some of these equivalent feeders are rated 10,000/13,333 k. v. a., that meaning that the transformer which has a 10,000 kilowatt self-cooled rating, with the radiators exposed to the air in a normal manner, can automatically, by the operation of relays, turn on some motor-driven blowers which blow air rapidly over the surface of the radiators in the transformer, and raise the capacity of the transformer.

This is used in connection with reserve service. If one 6158
line of any three of those were to go out of service, the other two would pick up the load.

Q. Now if you will, describe the portion of the sub-transmission system in and about Ashley Street? A. Ashley Street station, which was previously mentioned, has been in service for many years, has the ground around the station for a distance of about a block almost paved with cables. I believe that that statement is hardly much of an exaggeration. Literally, it is getting difficult to find room to put any more

—2,644—

conduits in that immediate vicinity, and the temperature rise 6159
of such cables has to be carefully analyzed as larger numbers of them are involved in close proximity, and each one contributes a certain amount of heat and the ground has to radiate it.

Ashley Street both generates and distributes 60-cycle and 25-cycle energy. The sub-transmission system at Ashley Street may be summarized for 60-cycle energy as: 21 feeders going to six sub-stations, including the downtown AC low-voltage network. This network is a relatively recent installation, and will be discussed in more detail later.

6160 *Stanley Stokes—By Respondents—Direct*

The 25-cycle system supplies energy to six sub-stations over 18 feeders, and also serves 13 Public Service Company (railway company) sub-stations over 13 feeders.

Q. Now have you stated the voltage of the feeders going out of Ashley Street? A. No, I shall do that.

The steam mains out of Ashley Street are large, and carry 200-pound steam pressure, and there has to be great care exercised where the steam mains and the cables are in the same vicinity, and problems of that type are the result
6161 of concentration of load in congested city areas. Such problems are not encountered in lower-load-density districts, but they frequently present real difficulty for satisfactory solution.

In this case, we have to highly insulate the steam mains,

—2,645—

and then provide special facilities for cooling the conduits, and one of our very large customers is a refrigeration company which has 10 to 15 miles of distribution refrigeration service. They pump the refrigerant around the city and expand it at different locations. Although we work very
6162 closely together to eliminate any problems that may arise, we get into some street intersections where the refrigerating company and the steam heating mains, and all the electric cables, converge. The steam heats the refrigerant, which causes it to expand and produces difficulties in pumping it, and the steam main also may have a detrimental effect on the electric cables; the electric cables may affect the refrigerating line, and they are not very good neighbors.

There is only a certain amount of space left in these streets, and we have to utilize what there is with the greatest care.

 6163

The voltage at which the energy at 60 cycles is handled out of Ashley, is largely at 13,800 volts. There are 25—13.8 kv. feeders (four tie-lines to Cahokia with 43,500 kw. in 13.8/33 kv. transformers). I have got to mention that at this point because, although it is located there and is intimately connected with this sub-transmission system, it was referred to and classified with the main transmission system, that is, those four feeders. They tie between the Cahokia station and Ashley Street station.

—2,646— 6164

The balance, twelve 13.8 kv. feeders, go to five sub-stations and customer sub-stations, and six feeders go to the down-town network transformers.

The sub-station which we refer to as No. 6, and which is located within the Ashley Street power plant building, is a 4,160-volt, 3-phase, 4-wire distribution station.

There are three generators connected to the 4,160-volt bus, having a combined capacity of 42,000 kilowatts, and in addition, three feeders connected to the 13.8 kv. bus, through 27,000 kilowatts of transformers. That is, there are several 6165
buses in Ashley Street, all of which are duplicated, again at increased cost, to obtain better service, and these buses are each used to supply certain load at the respective voltages, and in addition, each of these buses is connected with one or more of the others by a tie-transformer and cable.

The application there sounds complicated, but is relatively simple. It simply means that we have generation at more than one voltage, and on more than one bus. We have distribution to these sub-transmission cables at more than one voltage. And in order that there may be available reserve

service, each of these buses for the other, they themselves are tied together with sizeable transformer banks.

In the 25-cycle portion of the plant, there is a 6,600-volt bus to which four turbines, aggregating 56,000 kilowatts, are connected, and to which 25 feeders are connected.

—2,647—

Fourteen of the 6,600-volt feeders supply five D.C. stations with energy for their conversion equipment. Those stations are going to supply the Edison 3-wire D.C. system.

6167 Seven of the feeders go to five Public Service Company sub-stations, and four feeders connect to 34,500 kilowatts in what we call Sub-station No. 9, also located at or very close to the Ashley Street power plant building.

Sub-station 9 has four transformers of a total capacity of 34,500 kw., as mentioned above, which step the 25-cycle energy up to 13,200 volts; also eight 13,200-volt tie-line cables connected to Page Avenue, over which the 25-cycle energy can be exchanged.

More simply, and to clarify the general relationship, the Keoknk energy generated at Keokuk comes to St. Louis over

6168 the high-voltage main transmission line, is delivered to Page Avenue, from which point that energy can either go to the frequency changers and be converted and placed on a 60-cycle bus, or it can go down over these 13,200-volt underground cables to this Sub-station No. 9, which is Ashley Street, and there tie in on a 25-cycle bus to which the 25-cycle generating equipment is connected. Off of that bus there are distribution circuits, sub-transmission, which take the energy out to primarily the Edison sub-stations for conversion to direct current.

6169

I believe that describes that part of the plant sufficiently.

—2,648—

Q. Now, if you will, a similar explanation as to the portion of the system in and about the Venice plant? A. The Venice plant is not so complicated, it does not have so many facilities. It gets its power away from the plant, in general, by higher voltage lines and less of them. The Venice plant at this time has three 33 kv. cables supplying sub-stations in St. Louis. Those are submarine cables across the river. It also has two 66 kv. tower lines which supply transformers 6170
of 48,000 kw. capacity in Federal Sub-station at Alton. That sub-station will be described later.

The Illinois-Iowa Power Company receives power at 66 kv. and transmits it over their own double-circuit tower line into Illinois towards the north and east, going to Staunton and a sub-station site known as Stallings. We have no connection with that other than to sell them power at the power plant site.

The sub-transmission system at the Venice plant has three step-down transformers of a combined capacity of 40,- 6171
000 kilowatts, reducing the voltage from 66 kv. to 33 kv., and supplying the cables previously mentioned, which go to St. Louis, to two sub-stations.

There are also two 66 kv. feeders, previously mentioned, going to feed sub-stations at which point the general service for the entire Alton district is supplied. The details of the capacity of that station will be reserved for a little later

—2,649—

discussion. It is rather a major station in our system.

6172 *Stanley Stokes—By Respondents—Direct*

The Venice sub-transmission system, under discussion here, is being modified and supplied in a somewhat different manner at the present time, due entirely to the construction of the new Venice station.

The concentration of all of the power in that location at 66,000 volts, without any segregation by transformers, would produce, by the time the plant was extended to its second section, such heavy short-circuits that system reliability would be impaired. This does not mean that we could
6173 not go ahead with the present service as now rendered, which is highly satisfactory, but it does mean that at some time in the future we might be required to change the methods. We have looked into that matter carefully, and analyzed the possible effects on service, and have decided that we are justified in spending the necessary money today to connect those circuits into the new plant onto the 13,800-volt bus, and we are purchasing new step-up transformers to do that. That is a question which in many cases, I think, might be resolved on the theory that everything is all right, why not let well enough alone.

6174 We could save the price of four large transformers if we were willing to risk the reduction in the grade of service on the system. We have obtained approval to buy these transformers. —2,650—

I like to bring these points out, because they represent the added investment that is necessary in a system of this kind if you intend to deliver the very best grade of service which you possibly can, and in a concentrated district, I think that that is the only attitude to take. The service demands that type of reliability.

6175

I have very little else that I think need be mentioned there at Venice. These three feeders which have been described will be removed, the transformer will be removed, and used elsewhere, and the new transformers will be located in a row along the river on top of the levee, and each one of these will be supplied directly from our new 13,800-volt buses which were mentioned yesterday in the design of the new plant, and feed across the river very similarly to the Cahokia feeders, through the underground submarine cables.

6176

Q. Turning now to the Cahokia plant, will you give similar information as to the sub-transmission system in and about it? A. The facilities in and about Cahokia are, of course, many times more extensive than any of our other stations, and yet there is ample room to get all of these facilities out in an orderly and very simple manner, which we now appreciate. That is to say, the judgment which was used initially in locating Cahokia and in acquiring adequate land when the company obtained it, and in anticipating what the picture would look like 20 years later, has certainly paid

6177

dividends. That is to say, it is making the station one of excellent design today, whereas a lack of such foresight would have crimped the situation entirely.

I like to point to Cahokia as being a station with as many facilities going out of it as any that I know of, and yet it does not appear to be congested, and it is operating with perfect reliability.

The difficulties at Cahokia are few and far between, and never very serious.

The plant has two 66 kv. circuits leading from the outdoor sub-station in the yard, supplying power to the Illinois-Iowa Power Company at Belleville. Those two feeders have been previously mentioned under our main transmission system, but because we are describing the supply to this area, I mention them again.

Three 33 kv. feeders go to a sub-station in East St. Louis, known as Winstanley, as well as one known as Main, and Lake Avenue sub-station.

6179 Three 13.8 k. v. feeders supply a large number of customer sub-stations in East St. Louis, and the surrounding industrial area. That is, these three feeders, which have a capacity of roughly 3,500 to 5,000 kilowatts each, go around and tap various industrial plants where the plant itself owns its own sub-station. We supply them with power.

— 2,652—

The larger portion of the power from the Cahokia station crosses the river into St. Louis through a combined total capacity of 202,500 kw. in 13.8/33 kv., step-up transformers. These cables supply power to 12 A. C. sub-stations
6180 which are connected through 24—33 kv. submarine cables, where they cross the river, and thence, by ordinary underground lead cable in ducts, to the sub-station. One A. C. sub-station is supplied with power by two 13.8 kv. cables.

Four D. C. sub-stations receive power over four 13.8 kv. cables. This makes a total of 17 A. C. and D. C. sub-stations supplied by 30 cables.

At this point I would like to digress just a moment to illustrate that when we were describing the 25-cycle system at Ashley Street going into the sub-transmission feeders,

we mentioned that some of those feeders supplied the sub-stations which convert from 25-cycle to D. C. Now from Cahokia you have a similar group of 60-cycle feeders which go to similar conversion sub-stations to convert to the D. C. for the Edison system.

Thus we have about 34,000 kw. all told of Edison D. C. load which is about equally supplied from 25-cycle and 60-cycle systems. Thus, the most severe case of trouble that you could conceive, which might conceivably, under that assumption, shut down one whole system, either 25 or 60- 6182
cycle, would still affect only half of the Edison system, because they are not electrically connected between the 25

and 60 cycles in such a way that they can possibly affect each other to any extent.

Thus, the degree of reliability which we have obtained on the Edison system by the use of the two frequencies in that manner, would be impossible, as far as I know, to obtain otherwise. The record of this Edison system has been very good indeed.

Q. Where is the Edison system located? A. That Edi- 6183
son system represents the main downtown, heavy business district, running about 10 or 11 blocks north and south, and possibly 16 to 18 blocks east and west. It is a very small and dense area. The load density in that area is comparable with any part of New York except a very few blocks right in the Manhattan area. It is higher than the density of New York outside of that point. But it is a very small area, it only measures .4 square miles. It has, at the present time, about 75,000 kw. in that little area, which, if you divide it by .4, is a very high load density.

6184 *Stanley Stokes—By Respondents—Direct*

The additional load in that area is being taken on the A. C. low-voltage network.

I think no further details need be mentioned of the tie-system between Cahokia and Venice, or rather Cahokia and Ashley Street. There are transformers at Cahokia which supply these tie-cables to Ashley Street, just as there were at Ashley. Those cables, by the way, are 450,000 cm. conductors, on those tie-lines, whereas the majority of our cables

—2,654—

6185 are 350,000 cm. Those are large cables.

Q. Now, similar information as to the portion of the system around the Rivermines plant? A. Rivermines, as you will recall on Exhibit No. 51, was located at the southern end of our system, and is a major switching station on the Osage-Rivermines-Crystal City-Cahokia circuit. That can all be regarded now as one transmission circuit. We described it in sections yesterday, but it is all contiguous, and this switching station at Rivermines permits the segregation of that circuit into the section running between Rivermines and Osage, or between Rivermines and St. Louis, by auto-

6186 matic, high-voltage switching, in such a way that as long as any one of the four circuits feeding into Rivermines is available, service can be supplied. The result is that the St. Joseph Lead Company, with roughly 27,000 to 30,000 kilowatts of mining load, depends exclusively on our service for their operations, which is quite a compliment to the service. They had always felt that in addition to any kind of outside service supply, they should have a reserve steam plant, too. We have the plant there but we don't find it necessary to operate it; they do not insist upon it. When

they used to carry their own load with their own plant, they had an insurance policy with Lloyds which would pay the most fabulous sum in case a tornado took away their plant. I wish I could recall the exact figure, because it showed a

—2,655—

good example of the attitude that they had as a measure of the value of that service. If that plant should be blown away, they would be paid something on the order of $50,000 a day for the length of time required to rebuild it.

Q. From whom was the Rivermines plant acquired? 6188
A. We purchased the plant from the St. Joseph Lead Company.

Now in connection with this switching station which is the means of furnishing continuous service on these Osage circuits, we have located at Rivermines two 25,000 k. v. a. synchronous condensers. Those are rotating machines which are used to control the voltage on the transmission lines. It is a peculiar fact, well known to electrical people, that what is known as a leading current, meaning a current in which the voltage lags behind the current in the ordinary oscillation, if it were to be plotted you would find the current 6189
leading the voltage by certain angular degrees. When we have a leading current flowing through an inductance, a voltage drop is obtained. This voltage drop, instead of subtracting from the generating voltage as an ordinary voltage drop would do, is added in such a direction—this being a vector addition—is added in such a direction as to cause the voltage to rise. It is a rather peculiar phenomenon, but advantage is taken of that fact so that by operating a machine which is in all respects equivalent to a generator or motor,

—2,656—

with a very high field excitation, that machine will absorb the reactive flow of power, cause a leading current to flow in the main transmission line, and when flowing through a transformer will actually produce a voltage drop which adds to the generated voltage in such a way as to increase the total. The voltage at the end of the line, removed from the generator, can be made to rise instead of drop.

Those machines are automatically controlled to maintain voltage at any point desired, and to maintain the power
6191 factor of the transmission line as required.

Those facilities, again, are a measure of the service reliability. One of those 25,000 kw. machines is adequate to handle the transmission system. The other one is in there purely as a reserve unit and for additional reliability.

Off of this sub-station is tapped a transformer station, and that transformer station supplies a sub-station containing a number of 6,900-volt feeders. Those feeders supply the St. Joseph Lead Company direct. It has on the order of 50,000 k. v. a. of distribution transformers scattered around over the mining district there.

6192 In addition to that, this same step-down sub-station from 138 kv. down to 6.9 kv., supplies another sub-station from which several 33,000-volt supply feeders radiate to handle that area for normal commercial and residential purposes.

—2,657—

The switching station itself at this point, on the low-voltage side of the transformers, consists of a four-story building, filled with oil switches and cells and structures, just as any power plant would be, and the switchboard itself is, I should say, approximately 200 feet long, with one panel right after another. It is a very large installation.

 6193

I should like to give some detailed figures as to the number of these circuits which I have just described.

There are twelve 6,900-volt main feeders; two 6,900-volt feeders go to 15,000 kilowatts of 6.9/33 kv. step-up transformers, through oil circuit breakers, to a 33 kv. outdoor sub-station. That is the one that supplies the local area through five 33 kv. overhead lines. Those lines go north to Festus, Missouri—I don't believe the town is indicated on Exhibit 51, but it is adjacent to Crystal City, which is shown on the exhibit; also to a number of other towns in the surrounding 6194
district there, among which I can mention Farmington, Bismarck and Fredericktown, the latter being shown on Exhibit No. 51.

Two feeders supply the towns of Flat River, Bonne Terre, De Soto, Victoria—these towns all within a radius of 25 or 30 miles of that station—with service. This circuit, which was mentioned as going north to Festus, is primarily used as reserve supply for that town, it having another source at a sub-station at Crystal City which is shown on the exhibit.

—2,658—

6195

One circuit out of this Rivermines sub-station delivers energy to the Arkansas-Missouri Power Corporation for their supply in Southeast Missouri. That is not a major connection and I am not sure whether it is shown on this exhibit, Exhibit 51. Yes, I find it is shown here as "A-16", the point of delivery.

At Crystal City, which is indicated on the exhibit, we have another sub-station which supplies primarily, first, the plant of the Pittsburgh Plate Glass Company, a large glass manufacturing industry who receive service at main transmission

voltage of 138 kv., and who transform it down through their own transformers, and who own their own sub-station.

That is a very extensive and very interesting connection at that point. That is just a couple or three spans away from that river crossing which we described previously, and the difficulties of construction continued right on over to the plant. There is a very high bluff and some rugged hills and then a railroad yard and a small river or creek, with no place to locate towers. So the last span into the Glass Com-
6197 pany had to be carried for some distance and terminated on a tower 150 or 175 feet in height, in the Glass Company's yard, which they themselves provided.

It is a very rugged structure. Also, due to the alkali fumes which the Glass Company emits, we had to change from an aluminum to a copper weld steel in this last span. It also developed that we had to terminate on this receiving

—2,659—

structure in a horizontal position and were leaving the top of this high hill in a vertical position. The middle arms of this double-circuit tower had a large offset, that is, they were
6198 longer than the top and bottom, and in attempting to rotate these circuits from the vertical to the horizontal plane, with that offset in the arm, you cannot obtain safe clearances in the middle of the span. We anticipated the difficulty and made up a few model spans, and convinced ourselves that it just wouldn't work that way. So we located the long arm at the top, and rotated the two circuits in opposite directions. That changed the phase position of the conductors on the terminal tower.

We notified the Glass Company of this position, and gave them a diagram showing the position of the conductors. In

other words, if you numbered them they would be A, B, C—B, C, A, instead of A, B, C—A, B, C—and even at that, they got into a little difficulty in the preliminary development of the problem, because they didn't particularly receive our diagram with sufficient care, having been used to using single-phase transformers, and figuring that they could make their connections anywhere they wanted to on the low-voltage side of the transformers.

As an actual fact, when they went to make these connections they found that they had to make a change in the trans- 6200

formers to do it.

Service has been very satisfactory with that customer,—in fact, it has been one of the satisfactions in my work to deal with that particular customer. I made the original arrangements, and have negotiated with them from time to time in connection with change of contracts, and in every respect the relationships have been extremely satisfactory.

We, in one or two cases, felt we were leaning over a little backward in the arrangements that we made with the customer, but at a later date we wanted to change the service 6201 and extend these lines to Rivermines, and the customer reciprocated, and we felt well repaid.

The sub-station at this Crystal City plant of the Pittsburgh Plate Glass Company is operated jointly by ourselves and the customer for our mutual economy. That is a rather interesting situation there in which they have their own operators, we have the communication lines in there, we divide the cost of operating the sub-station, and in turn they supply to us through their transformers, voltage which

6202 *Stanley Stokes—By Respondents—Direct*

we step up to 33,000 volts, and in turn we supply our local area at Festus, Crystal City and Herculaneum, three cities adjacent to each other.

That arrangement has been very much cheaper than for each of us to do this thing by ourselves. In addition to that we have, within the last year, negotiated a contract

—2,661—

which gives us permission anytime we wish, to install our own transformers, of larger capacity, in their yard, and to
6203 utilize all of the facilities of the high tension spans, towers, switches, and so forth, and supply our own service with them, thus giving them the full capacity of their own banks. This anticipates a joint growth of load on their part and ours, too, and it is interesting to realize that after operating on a joint basis since 1925, we are both willing and glad to enter into an agreement to continue such operations.

That sub-station has two 10,000 k. v. a. transformers, stepping from 132 kv. to 2,300 volts. We step it back up from 2,300 volts to 33,000, through two 3,000 k. v. a. sub-stations. At the time this agreement was entered into,
6204 we had just gone into the new district and were supplying service and had a load of only about 650 kw. ourselves. That load has multiplied many times since then, but we could not have justified a separate high-voltage sub-station for our own purposes. At the present time our load is big enough so that we could justify it, but we still find it economical to work this joint arrangement, although we are going to eliminate the double step-down and step-back-up voltage practice.

There is one other sub-station which I should like to mention, and it is located on the north route of the 138 kv.

transmission line between Osage and Page Avenue, and is marked as a square with the letter "A" on Exhibit No. 51. That is located in Franklin County. That is, as far as I

—2,662—

know, the only fully automatic, high-voltage sub-station of its type, although others are in contemplation.

It has been operating with great success for two years. It has two high-voltage switches which connect on the 138 kv. lines, an automatic transfer system to provide a certain type of selective service; one bank of transformers which step the 6206
voltage down to 33,000 volts; and the low-voltage facilities.

One of the interesting features of this sub-station is that it was intended to be a fully automatic, unattended station, located out in a country district some 6 miles from the nearest town. The requirements were that no operations of this station should interfere with the service of the main transmission line in so far as it is at all possible to do so.

So far, no such interference has been observed. This requirement, however, placed very serious restrictions on the time available for relay and switching operations. The stability limits of the Osage-Page circuits were such that 8 6207
cycles was the longest time that we were permitted to use in clearing the circuit in case of trouble. If a short-circuit were to occur on one of the outgoing 33 kv. feeders, from this Franklin County sub-station, and if that short-circuit were adjacent to the sub-station, calculations showed that it would

—2,663—

be able to interfere with the main transmission line.

Therefore, we would have to get that service off even quicker. The result was this, that we developed, in consul-

6208 tation with the General Electric Company, a device which they call a relay, but which is really about half a dozen or so relays, mounted in a glass case, and those relays measure the distance of this accidental fault from the sub-station. If that fault is more than a mile and a half, we delay the operation of the 33 kv. switching, giving time for the individual 33 kv. supply lines that go out through that district to clear. By that I mean, if you have 5 such circuits, which we have, if there is trouble on one of them, we wouldn't
6209 anticipate that, but we will let it clear itself if it can be done within 10 or 12 cycles.

If, however, that fault is closed to the station, this relay system uses a little judgment and we clear out the main switch in the sub-station, which will interrupt all five of those 33 kv. circuits, rather than interrupt the main transmission line, and then they are all re-closed immediately. I should have mentioned that this station is not only automatic on the transfer from one circuit to another on the high-voltage line, but also automatically reclosing and finally locks itself out and rings a bell after the third operation.
6210 It has only locked out once, as far as I know, and that was due to a snake climbing 30 feet up a steel structure, which

—2,664—

they are not supposed to do. When I say that, I mean that it is the general belief out West in the prairies that if you lay a lariat or steel cable or steel rope around your tent, a snake will not crawl over it. I used to do it with regularity when I worked for the Utah Power & Light. But there is a slight spitting due to corona on these sharp points around such a station, and it makes a little hiss, and the natives

have assured us that the snake thought there were some birds up there, and went up after them. We got the snake, but he didn't get the birds.

That instance was the only lock-out that we have had, that I know of.

This sub-station in Franklin County is designed to replace the present transformers with larger ones at any time that the service requires it, and the sub-station can readily be brought up to any convenient capacity, such as 25,000 or even 50,000 kilowatts. The immediate requirements are 6212
small, and the present capacity is, I believe, four 3,333 k. v. a. transformer units.

The units themselves are single-phase. The reason for that was that the weight of the 3-phase transformers was too great to handle over the roads and the bridges, and even taking the ones we did, we had to block up under some of the bridges.

I think that covers the main sub-stations of Rivermines, Crystal City, and the Franklin County sub-station.

—2,665— 6213

The Examiner: Let us have a short recess at this time.

(Whereupon, a short recess was taken, after which the hearing was resumed.)

By Mr. Hamilton:

Q. In addition to the sub-stations you have already referred to, in the sub-transmission system, are there any

6214

other sub-stations of major importance in the system? A. Yes, there are at least two important stations that I should like to mention. They are a little different than the stations so far mentioned, namely, in that they are large sub-stations at the end of the sub-transmission system.

One of them is the Federal station at Alton, which covers what we call the Alton district. The town lies about 25 miles north of East St. Louis, and has considerable heavy industrial load in the area. The sub-station is supplied from

6215

the two 66,000 volt lines that go north from Venice to Alton, and it, in turn, is a switching station and transforms the voltage to 33,000 volts, and distributes it over a number of rather high capacity 33,000 volt circuits, going to such customers as the Laclede Steel Company, and the Owens-Illinois Glass Company.

It also supplies a sub-station for the City of Alton, known as the Liberty Street station.

The capacity of that station at the present time is 48,000 kilowatts, and the circuits having been recently enlarged, we

6216

—2,666—

expect to transmit ultimately 45,000 kilowatts on either circuit, and will expand that sub-station.

The load is growing very rapidly in that district. Included in the customers supplied from this, I should not overlook the Shell Company. They have a load which has been increasing at the rate of from 500 to 1,000 kilowatts a month for the last six months, and an anticipated load of about 14,000 kilowatts by the end of next year. The present load is around 12,500 to 13,000.

Loads of that character are quite a responsibility for an electric company, and we have had very successful service for that refinery.

The other sub-station which I should like to mention is the Webster Groves station. This is located in St. Louis County, west a few miles from the St. Louis city limits.

Three 33 kv. circuits from the Cahokia plant are brought in to the 33 kv. outdoor sub-station at Webster Groves. From this sub-station, two 33 kv. circuits go west and north, supplying energy to the various towns and villages, and supply- 6218
ing a reserve circuit which goes to Franklin County and ties in with that automatic sub-station which I have previously described here.

In addition to the switching station supplying outgoing 33 kv. feeders at Webster Groves, it also supplies considerable capacity in step-down distribution transformers for local distribution. That will be covered a little more ex-

—2,667—

tensively in our discussion on the lower-voltage distribution system.

I believe that that covers all of the sub-stations which 6219
I feel should be specifically described. You appreciate that there are a large number of these stations which are of a somewhat lesser importance than those mentioned, and I could go into a detailed description of them for hours. But the typical larger ones have been described.

Q. Is the sub-transmission system in the St. Louis area designed to insure reliability of service? A. It very definitely is. That is a point that I alluded to a little earlier in my discussion, that the multiplicity of interconnections of these

6220 *Stanley Stokes—By Respondents—Direct*

33 kv. sub-transmission circuits in St. Louis, and St. Louis County particularly, and to a large extent in the rest of the area, provide an opportunity to restore service, in the event of outage, very quickly, and in addition to that, provide sufficient capacity that such outage should have no effect on the service itself.

The 33 kv. circuits in St. Louis County criss-cross in the form of squares on most of the main roads, and by changing the disconnecting switch positions, the circuits can be routed
6221 in different configurations, so that our Page Avenue sub-station could supply the City of Kirkwood, for example, or Kirkwood could have been supplied equally well out of the Webster Groves station. In the event there is any highway

—2,668—

work goir g on, of which there has been a great deal in recent years, we try to keep at least one reserve circuit supplying these major communities, on a highway which is not being constructed, that is, the pole lines are either parallel with the highway or back on private right-of-way a few feet. And there is always the possibility of the highway work causing
6222 some damage, due to blasting or otherwise. So the facilities for interconnection are very extensive.

The feeders for this sub-transmission system are operated in parallel on the low-tension side of the transformers, that is, the cables leading from the main high-voltage transmission system out to this receiving sub-station are usually operated as a cable and a transformer, each cable having its own transformer, and the switching being done on the supply side of the transformer at the source, and on the receiving side of the transformer at the receiving end.

6223

The result is that we keep the short-circuits down by that method.

On the low-voltage side of the receiving sub-station, we have a regular standard bus construction with all the low-voltage circuits in parallel, supplied through oil switches.

Q. You referred to tl rather extensive use of underground cables in St. Louis, and the area more or less contiguous to St. Louis, in St. Louis County. Is the matter of cable loadings a subject of considerable investigation by

—2,669—

6224

the Union Electric Group? A. Yes, it is. We have had to do rather an unusual amount of work in this connection in establishing suitable cable ratings, the reason being that St. Louis has very high ground temperatures in the summer. Our water mains reach a temperature of 90 and above in dry, hot summers, and we have had a temperature of 94 in the Mississippi River water at that point.

—2,670—

To bring out the extremes to which some of those conditions got to in 1936, which was our all-time hot year, the river water going into Cahokia at a temperature above 90, went through the boiler room concrete floor and into the shower baths, where the men cleaned up after working hours, and the water got so hot that they couldn't take a bath. That was just due to the temperature of the water all being—already being 95 when it came into the building, and passing through the boiler room floors where there was heat in the concrete, and the cold water got so hot that they couldn't stand it and complained. That condition is not general. Therefore, other cities can be of little help to us, and we have to work out our own rating by experience.

6225

6226 *Stanley Stokes—By Respondents—Direct*

We have gradually developed a sort of discount table that we can apply to what are generally conceded to be conservative cable ratings, and we have to use a little lower rating in the summertime. We establish what we call emergency rating on a cable, and that is the highest load which we will put on that cable in the summertime. Then we have a normal rating which represents the maximum load that we would be willing to carry on the cable at all other times. Those loads have to be taken into consideration with the number of hours
6227 which they operate because the cable and duct system heat up gradually as the load is increased.

A cable which has been running cool over Saturday and Sunday, can carry much more steady load Monday than it

—2,671—

could on Tuesday, because it has had 36 hours to cool off. The result is that the matter of cable ratings is really a complicated subject.

Our present conclusions are these. A 450,000 cm. which is the largest size we use regularly in the 33,000-volt service,
6228 is rated at 13.8 kv. at 7,730 k. v. a.; at 33 kv., at 16,500 k. v. a., each.

The normal operation of such a cable would be to have two supplies to a sub-station. The result is that the normal load would be 50 per cent. or less, because there will be two cables supplying this load. And the only time that the load would go up to these values would be when one cable is out. Now, of course, it is entirely likely—in fact, it is very probable—that neither cable will be out during the hot weather, in which case we could have increased that load to possibly a couple of thousand kilowatts higher, but we can't assume

6229

that, so we limit the emergency rating, which is the rating we will put on the cable when the other cable is out of service, to these values.

For a 350,000 cm., 3-conductor cable, which is the one we use the most of, we have 6,680 k. v. a. at 13,000 volts, and 14,500 k. v. a. at 33,000 volts.

The other two sizes, which are in rather general use, are 4/0, rated at 5,030 k. v. a. at 13,000 volts, and 11,000 k. v. a. at

—2,672—

6230

33,000 volts. The smaller one, 1/0, is similarly rated at 3,480 and 7,400.

If we have a large number of these cables in a duct, or if we know that there are other cables in the street adjacent to it, we apply a correction factor and reduce the rating accordingly. In other words, we have got to make allowance for the total heat liberated within a given ground area, and as a result of considerable study and analysis of the life of cables in the St. Louis district, we feel fairly satisfied with these ratings. There is one question, however, and that is it is entirely possible that some of these emergency ratings

6231

can be materially increased without actually damaging the cable. That is receiving much study at the present time.

Damage to cables is being carefully analyzed and a post mortem, so to speak, carried on after each cable failure, with extreme care, trying to find out why the cable failed. We found that, among other things, the creepage of these cables in the ducts, due to expansion and contraction with temperature changes, was such as to cause a crystallization of the lead at the point where the cable leaves the duct and goes into the manhole, and that many of these failures were

attributable to such causes as that, and not directly to the high temperatures. If those prove to be the majority of the troubles, then it will be possible, by using more care in the design of cable and duct arrangements, to actually run these cables to much higher temperatures without damage.

—2,673—

There are some experiments being carried on to determine that, and it takes several years to be sure of these figures. It would mean a great deal to any company to be able to
6233 increase these ratings by even 10 per cent., because the investment in the cable system is huge.

One other expedient that has been adopted is this. Where we go through a soil that we know to be particularly a poor heat conductor, for example cinders, a cinder fill, we have learned to increase the size of the cable. We will put in a section of 450,000 cm. in a cable where the rest of it is 350,000 cm., thereby reducing the losses in that section, and hence reducing the heat and keeping the temperature down that way.

Q. Are the present sub-transmission facilities of the
6234 Union Electric group adequate for present loading and for presently anticipated loading? A. They are, and in addition they have a large reserve capacity. The approximate ratio of loads on some of these cables, to their maximum capability or capacity, may be illustrated.

The particular examples that I am using here are taken from some alternating current sub-stations in the City of St. Louis, but it would be equally applicable to any of the others. These happen to be more convenient to obtain the information on.

—2,674—

6235

In a list of 23 stations which I prepared, the highest loading that I could find was 75 per cent. of the capacity of the transformer banks, and this occurred at the Page Avenue station. That station is scheduled for an addition in the near future.

The next highest loading in this group was 67 per cent., at a station known as Lesperance. That is still satisfactory down there at that station because of the interconnection with other stations. If that were 100 per cent., we could still operate satisfactory because we have ties with other 6236 stations that would carry part of that load.

In general, looking over this group, we find figures as low as 28 per cent., 30 per cent., 32 per cent., and the result is that the average ratio of load to capacity does not exceed about 50 per cent.

Q. Now, that percentages, is that the peak on the particular sub-station? A. The peak on the particular sub-station, yes. It may not be at the time of the system peak. That has no interest to a particular sub-station. It is only concerned with its own annual peak.

I might explain why there is as much capacity in some 6237 of these stations in reserve as there is. That is, if there could be any criticism of this ratio it would be that we haven't got these stations loaded up high enough.

—2,675—

The answer is that a good many of these stations are relatively new, and it is not practicable to put in these high voltage underground cables and ducts in small sizes. The duct cost is high, and the cost of a 10,000 kw.-33 kv. cable is only slightly more than one of smaller size. In other

words, the insulating requirements are the same, the lead sheath isn't much different, and whether you put a small wire in or a big wire, you have spent pretty near as much money.

Therefore, it is better to put them in as big as you intend to put them in ultimately, even though you have to carry the fixed charges for a few years. The result is that we change transformers as needed, and ship them from the larger stations to the smaller ones, but cables are usually
6239 put in with ample capacity, and in these downtown or city stations, we put the transformers in to match the cable. Within a few years that ratio will be higher on these low values. The low values will increase, in other words, we will have the stations loaded up to a higher ratio, but the high values will be kept down for transfer of load or adding additional capacities. In general, there is ample capacity in this system to handle much additional load.

Q. Now, will you summarize the number of feeders on the sub-transmission system, giving a total figure, if you will? A. The sub-transmission system has a total of 226
6240 feeders on both the 25 and 60 cycle systems, and they are approximately equally divided between those two.

—2,676—

As an example, I have 66 kv., 60 cycle feeders; 25 cycle and total.

There are 6-60 cycle feeders; 3-25; and 9 total.

Now, if I go through the different voltages and the different frequencies in that manner, I arrive at 117-60 cycle feeders, of all voltages from 66,000 volts down to 6,600; and 109-25 cycle feeders, or a total of 226. These are not to be

confused with the ordinary small distribution feeder, but they represent capacities from 5 to 15 thousand kw. each.

Q. At the outset of your discussion of the sub-transmission system, you indicated that the sub-transmission system represented the link to the distribution sub-stations. Turning now to the distribution sub-stations, you are able to state the total number represented in the Union Electric Company group? A. These distribution sub-stations which receive their power from the sub-transmission system and distribute it to the moderate low voltage distribution sub-stations, rep- 6242
resent 63 alternating current and 9 direct current sub-stations in the Union Electric group, with an investment in excess of $11,600,000 in land, structures and equipment.

The total connected capacity of these stations is 643,000 kilowatts and they range from a 100 kilowatt station to one of 42,500 kilowatts. That summarizes the distribution stations.

—2,677—

Q. I think you might state at this point, in order to clarify any description you may give of the distribution sub-stations, 6243
the general character of your distribution system, whether network, radial or direct current? A. Our distribution system is, to a large extent, what is known as the radial system, preponderantly so. This is the result of long years of historical growth, combined with many factors that made this the most economical arrangement for our conditions.

In addition to the radial A. C. distribution system, we have a low voltage A. C. network in the downtown district. This supplies service to the customer at 120/208 volts, and it is supplied from a series of what are known as network transformers.

6244 *Stanley Stokes—By Respondents—Direct*

These are in turn supplied from a 13,800 volt sub-transmission system.

At the present time I should like to place more emphasis on the radial system. In the St. Louis district we have, as previously described, supplied our distribution sub-stations by means of 33,000 volt and 13,000 volt underground cable, and in a great part of the city we still are able to retain the distribution on the low voltage side as an overhead system. We removed 5 miles of this system every year, and replace it
6245 with underground supply. It is appreciated that this type of system is adapted to what is known as the radial system. The other systems have a feature of using a large number

of small sub-stations, and a radial system uses a smaller number of larger sub-stations.

The result is that the radial system economizes on the cost or investment in the supply facilities of the sub-transmission feeders.

In St. Louis these facilities represent the most expensive part of the system and therefore, to economize on the supply
6246 facilities is a little better for us than to reduce the cost of the low voltage distribution, which is already less expensive.

That is not true in all areas, or in all cities. The 9 sub-stations supply the 120/240 volt direct current system, which covers 1.15 square miles in downtown St. Louis. This is not what apparently might be regarded as an error in the area, which I previously stated as .4 square miles. The downtown D. C. district extends beyond the particular area to which I referred as an extremely dense area.

In these 9 sub-stations there are 19 motor generators totalling 27,800 kw. and 10 synchronous converters, totalling 21,400 kw.

 6247

I have previously described the extreme reliability with which this service is supplied, coming from both the 25 and the 60 cycle systems, each being independent of the other. The result of this high degree of reliability permitted us to do away with storage batteries in 1925, and maintain the same degree of reliability on our Edison system that certain

other companies were obtaining with the addition of storage batteries. They were the most expensive single part of the operation of the Edison system, and it has always been our belief that had storage batteries been eliminated in general throughout the country in the early days, and had more automatic equipment been installed on these Edison sub-stations, that the attitude throughout the country on the Edison systems might have been different. 6248

We do not regard it ourselves as being a particularly expensive system to operate. We are not extending it, but we feel that it has a high degree of reliability, and that it is probably equal to the best grade of service that can ever be rendered by any other system.

The new A. C. current network which is being installed and rapidly extended is the nearest prototype to the Edison three-wire system which can be produced with an A. C. system. It should give equally reliable service. 6249

I would like to point out here that we obtained the benefit, through these years, of pioneering work done in the development of fully automatic sub-stations, and the public has obtained the economy of the—in the elimination of these huge batteries over many years, because of the successful

operation of the automotized sub-stations. The longer we stuck strictly to manual operation, we could not do these things quickly enough to maintain the service. The storage

—2,680—

battery was a necessity.

The total capacity in the D. C. equipment is 49,200 kw., 23,444 being supplied from the 25 cycle system. You will notice there what a nice balance that is, 50 per cent. roughly being supplied for each system, and by overload and a little

6251 excessive loading of cables, if we lost one whole system, either 25 or 60 cycles, we would deliver reasonably satisfactory service in the downtown area. That is a high degree of reserve.

Service on the new 120/208 volt, low voltage, A. C. network, was inaugurated on May 20, 1939. This network now covers the entire D. C. district, but it is not yet fully loaded, nor anywhere near it. It is an unfortunate situation that to put in a thoroughly reliable A. C. network requires that it must practically be put in all at one time, and that all 6 of the supply feeders be provided in the beginning. There have been

6252 some sporadic attempts in various locations to economize on the installation of a A. C. network, and put in only part of it at a time, hoping to go into the rest. The results were not very happy. In other words, the fundamental basic principle of the A. C. network is that these network transformers located in the vaults, of which mention has previously been made, shall be supplied from at least three pairs of circuits, so that the loss of even any one or two of them will have no effect on the service, and the loss of the whole network vault will not affect the service.

—2,681—

6253

An illustration could be made in this way. Network transformers are designed to have at least a 50 per cent. overload rating, and also a very high short-time rating. If we wanted to supply 3,000 kilowatts of very essential service—I am describing now a type of service where you want to get the best there is—the two installations which are exactly equivalent and done in the same manner are the Radio City installations, which everyone in the country has heard of, and one which so many have not heard of, but which is a complete and duplicate arrangement, located in St. Louis, being in- 6254
stalled this summer for a very large department store, an air-conditioning installation.

There we want to have 3,000 kilowatt service for that building, which cannot be interfupted for any one of almost any number of reasons. The result is that if we were to lose one of those four 1,000 kilowatt transformers, which are installed, we could still supply the 3,000 kw. service. If we were to lose two of those transformers, the other two would be operated at overload until the others were repaired, and we would still supply 3,000 kw. of service. If we lost one of the main feeders from the main power plant, we could lose 6255
one transformer and still supply the service, and similarly if we lost two, we could still supply it.

Not only that, but those transformers are connected to

the customers' service, and also to our street mains, so if we lost a little more than that, we probably could make it up from our other network stations located at the corners of the block, or conversely, if the customer has no peak load on at the time, and has lost no equipment, we have the bene-

fit of at least 50 per cent. of that installation for other customers up and down the street.

This type of service is what is known as service designed for a second contingency outage. Most service can stand one type of outage, but it is in difficulty when the second occurs. Now, the efficiency with which this equipment is being used under those conditions may be expressed as 75 per cent., in other words, we have only 4,000 kilowatts of transformers and cable facilities, and we are able to carry
6257 three-quarters of that as effective firm load, and sustain it through a second contingency outage.

Naturally, that type of service costs a little more than a lower grade of service, but it is what builds the business and the good will.

The growth on that network system is taking place so rapidly that I understand that 1,000 kilowatts or so has been added since I got these notes some two weeks ago, when I made this tabulation, and the installations this summer were anticipated to be 10,000 kilowatts. I don't believe they all came on, but I believe they will all be on by next spring.
6258

—2,683—

Q. What is the function of the network system, is it to pick up the additional network load growth in the downtown system? A. It is expected to ultimately supersede the older systems of all types, and we hope that if you were to look many years into the future, you would see one simplified system of an A. C. network handling all loads in the area, and the elimination of all other systems in that particular area. We don't care which system we use, we want to use the one which supplies the service the best, and that

6259

system will be determined by the load density in the area. What we hope to do, insofar as possible, is to not duplicate the system, we want one, but not two, because each system that overlaps the other in the same area, saps the load and divides it between two systems; whereas, if only one were available, your overall efficiency on your investment would be greater, and we are making every effort to follow that principle; but in our four kv. radial distribution systems, we carry all the loads in that area on that system, and would not hesitate to pick up a relatively large industrial load. 6260
On this 120/208 volt network, we are not hesitating to pick up a 3,000 kw. customer, the point being that if we can do the whole thing in a given area, with one system, we will give better service, and greater reliability at lower cost, than if we let it overlap into two or three. So that even in the D.C. district we can not avoid building some of this A. C.

—2,684—

stuff into the same area in order to pick up the load growth, but the ultimate plan is to eliminate any duplication.

That new A. C. network system we have just installed is 6261
the very last word in the United States on that class of equipment, there is no better. It ought to be, because it has just been installed. We studied the various systems throughout the country for several years, anticipating this installation, because it will be the major investment for the whole company at some time, and to get started right is extremely important.

We thought we might go into it three or four years ago, but we studied it carefuliy and decided that there was no merit in doing so. The fact that that conclusion was correct

6262 *Stanley Stokes—By Respondents—Direct*

has been demonstrated because since that time there have been several changes of opinion in the country as to what the final A. C. network voltage and type was to be. Some thought it would be a 5-wire system; others thought it would be 2-phase, and all of those installations are available around the country, but there are now in the neighborhood of five or six hundred thousand kilowatts of total load in the United States on network systems at this voltage, and that is so preponderant that there is no longer any possibility that
6263 some other voltage may become the ultimate future standard, and we feel entirely safe in adopting it.

To get our system in the best possible condition to make

—2,685—

the most use out of this new A. C. network, we made a study of the lamp ultilization voltages on our system, and compared that information with the use of such utilization voltages on other systems of the North American Company, and as a result we decided to raise our voltage about 2½ volts and adopt what is known as the 120-volt lamp; whereas for many years we had used the 115 volt standard. That
6264 change, we feel, is highly beneficial, and the change was made without anyone observing it or causing any inconvenience. It results in this, that we can use the same lamp downtown on 120/208 volts system, with perfect satisfaction, that we use out in the radial system. The 115 volt lamp would not have been so good. And we thereby avoiding have two different lamp standards on the same system. That in itself is worth a great deal, not only to us, but to our customers.

Q. Returning to the distribution sub-stations, will you state the general character of construction employed? A. The

distribution sub-stations are so different in size that one cannot describe one type of construction. I can say that the stations run from 100 kilowatts, and that may be a little pole type station, mounted on a steel structure, on a pole out in a country district, with its own automatic regulation --up to a station of, say, 42,500 kilowatts, which represents the latest type of equipment, mounted in a modern brick building with a very nice external appearance.

--2,686--

In this connection, the architect who furnished the ap- 6266
pearance engineering for that building, got the highest award at a recent exhibition of architectural photographs in some salon, carried on last year in New York, and he showed me the picture with pride.

That is our new Carondelet sub-station, and a very beautiful building.

The larger sub-stations are fully equipped with oil switches, fuses, and the usual paraphernalia that goes with those things, and operate on an automatic reclosing cycle. By that I mean the oil switch, in case the feeder gets into trouble, will open the circuit, reclose immediately—if it is 6267
still in trouble it will reclose again, and try that three times, and if some trouble still persists, it will lock it out and ring an alarm.

The record is that the average trouble record here for the last several years has been a half a case of trouble per feeder per year, or one case of trouble per feeder every two years, 80 per cent. of which reclosed automatically, and resulted in merely a flicker. If you were to double that grade of service, you couldn't tell the difference, it is that

6268 *Stanley Stokes—By Respondents—Direct*

near perfect, in other words, one flicker every two years on a feeder for 80 per cent. of all of them.

Fellows have wanted to sell me some equipment to improve that service, and I told them that I just didn't see how I could justify it. It probably will be improved some day, but that is pretty good.

—2,687—

Now, in these city sub-stations we were confronted, as all others have been, with the increasing cost of oil switch
6269 equipment, and while some engineers gave consideration to elimination of switches and using reclosing and repeating fuses, to reduce the cost, we looked into that a little, and we decided that the solution of the problem, because we do want to deliver this service at a reasonable cost, was to use the best equipment we could get, but to load it to its capacity. In other words, an analysis of these various systems showed that many of these circuits are only loaded to possibly a fraction of their actual capability, and if we could keep the equipment going at its rated load, we could keep our unit cost per kilowatt down. With that in mind
6270 we found that certain of our metropolitan sub-stations had a sufficiently limited area of distribution that all feeders either were or could be made of approximately the same length. That meant that we didn't have to have such a high degree of regulation, of regulating control, such as 10 per cent. up above or below the standard voltage. We could do with 5 per cent. above or below in these automatic inductions regulators.

The result was that those regulators, which are constructed as 250 amperes, when operated at 10 per cent., or 500 amperes when operated at 5 per cent. regulation, were

reconnected and re-rated from 250 amperes to 500, and supplied entirely adequate regulation.

—2,688—

The switches could already handle that load. So by that simple method we doubled the capacity effectively of several of the downtown stations, and all we had to do was watch that any long feeder be eliminated and connected to some other sub-station. All of these feeders, I should say, are carried out and terminated at the end of a feeder from some other station, so that in the event of any trouble, this one 6272 can be opened up and supplied from some other station. That is in general, a brief description.

The 13 A. C. sub-stations in St. Louis supply 124-4,500 volt 3-phase, 4-wire feeders, 112 of which have induction voltage regulation. The remainder are industrial feeders and the customers do not care for the regulation and get a slight discount for unregulated service.

The area covered within the city is 62 square miles, and the location of the sub-stations is based on an economic study of the location of loads, using a sort of center of gravity method of calculation and we try to determine which one 6273 should be installed next.

We have almost obtained a complement within the city limits, I believe two more is all we will ever need, and then those will have to gradually increase in capacity, but we will have as many as the area requires.

Of these 124-4,500 volt feeders, 106 of them have single phase induction regulators, and 6, located at what we call our Kingsbury sub-station have the regulated bus. By that

—2,689—

I mean, we have a very large device which regulates a bus

off of which a number of feeders are taken as a group. That again is a relatively recent change on our part, as a matter of economy, and no reduction in the grade of service is involved. It simply means, as the load area is developed and new buildings are built, and the density gradually builds up, at the present time we might have sub-station A here, a space, and another sub-station which I will call C here. The intervening sub-station has not yet been built because it wasn't needed.

6275 After all of those sub-stations are in place, when this B sub-station is installed, these feeders which went from A to C will be cut in two, and with half the length and half the load, you can get about four times as good regulation. Finally you get to the area for which this sub-station was really ultimately designed. At that time you can convert the station to what is known as bus regulation, regulate the whole bus up and down together, take these regulators off and move them to a new station, and start the process all over again. By that method we avoid the unnecessary purchase of large numbers of feeder regulators.

6276 You must keep in mind, though, that that couldn't be done in the beginning, because in the beginning you have to supply both long and short feeders, as they go into the different areas.

That is a rather brief and sketchy description, but it

—2,690—

gives you an idea of the extent of this system.

The Examiner: Let us recess until two o'clock.

(Whereupon, at 12:35 o'clock p. m. a recess was taken until 2 o'clock p. m. of the same day.)

—2,691—

AFTERNOON SESSION.

(Whereupon, at 2:00 o'clock p. m., the hearing reconvened.)

The Examiner: Let us resume, gentlemen. Are you ready?

Mr. Hamilton: Yes, sir.

The Examiner: Go ahead.

Whereupon, STANLEY STOKES resumed the stand and testified further as follows: 6278

Direct Examination by Mr. Hamilton (Continued):

Q. Please continue, Mr. Stokes. A. The 4,000 volt distribution sub-station feeders are, as a general rule and with very few exceptions, operated as single-phase feeders.

I should explain that a little more and state that this is usually referred to as a four-wire system in which the voltage is approximately 2,400 volts between the fourth wire or neutral and any one of the other three wires referred to as phase wires. 6279

This type of feeder starts out from the sub-station with four wires and at various points along the feeders the neutral —that is, the fourth wire—and one of the phase wires, is taken off and goes down some other street and is called a branch.

The two wires so tapped off of the four-wire circuit are

called a single-phase circuit and that is the one that is used to supply the residents.

6280 *Stanley Stokes—By Respondents—Direct*

These various single-phase circuits are distributed around on the various phase wires so that the load at the sub-station is properly balanced on all three wires—the fourth wire under perfectly balanced load would not carry any current, although in a large part of the country these circuits are switched, all four wires or at least all three wires with a single oil switch.

In St. Louis, and, I believe, one or two other cities of the North American group of properties, the switching is car-
6281 ried out as a single-phase operation.

In other words, we provide a separate switch for each of the three wires. By switching in this manner, we interrupt only one-third of the service which would have been interrupted had we opened all three wires, because the service difficulty is, in almost all cases, confined to one or the other of the wires and rarely involves all three.

By this method of switching, we improve the grade of service over that which could otherwise have been rendered with a material reduction in any possible service outages. I think that is clear. And that the switching of one wire out
6282 of three should result in a material improvement in the services.

Where industrial feeders are supplying current where a large percentage of three-phased motors is involved, those feeders are called three-phase feeders and we switch them all

—2,693—

as a unit.

There have been many developments from time to time that have proved very useful. One, which was first applied, as far as I know, on our own system, was the use of a ground

relay connected between the base of the regulator and the ground.

We were surprised, a few years ago, to learn that the number of regulator fires had been very low on our system compared with some other systems, and, in trying to determine why we were a little more successful, we found that this ground relay which we had used for a number of years, had operated in several instances.

Any one of those instances could have produced a regulator explosion and corresponding fire. Such fires are always 6284
very serious and result in a loss, not only of property, but frequently of life.

There has been a serious case of that kind within the country within the past year and a half.

In conclusion of this particular discussion on distribution sub-stations, I should point out that our general method is to start a sub-station in a new area with two transformers, each terminating two cables from the power plant, each cable coming from a separate bus section in the power plant, so that the failure of a bus section or the failure of a cable will not affect the service to the other transformer at the sub- 6285
station.

—2,694—

These transformers are parallel on the low side and the switching and service from there on has been described.

On the high voltage side, which affects the supply cables, these are 33,000 volt. We then tap one of those cables and carry it to another sub-station.

For example, if we had two transformer stations, we would have three cables. In other words, we always provide each station with one cable which has no taps on it and one

6286 *Stanley Stokes—By Respondents—Direct*

cable which has one and later two. We do not exceed that.

In that way we have made an economy in the use of our supply cables and in no case, over many years operation, have we ever failed to have the adequate amount of supply. That is based on the theory and probability that a certain number of things would have to occur at the same time and we have, between these various sub-stations, a certain amount of low voltage tie capacity—that is, by tying the low voltage feeders together, a certain amount of load can be supplied
6287 from one station to another and even if we have 50 per cent. or 75 per cent. overload on one transformer during a case of trouble, that will not damage it in the length of time that it takes us to redistribute the load and pick it up from the surrounding sub-stations.

The result is that we attempt in that manner to produce the greatest economy and supply the system without affecting the reliability of the service.

—2,695—

In the operation of these stations, I should mention there, as part of the description, that we do have to carry out a
6288 thorough system of inspection and testing at all times and insure that all the equipment is in satisfactory operating condition.

Q. Now, how frequently are these inspections conducted? A. Well, it depends on the nature of the sub-station and on the type of service.

For example, in the automatic D. C. stations, the manager is in there some time during the day. He doesn't stay long but he goes over a routine.

We learned that by experience. In the early days of automatic sub-station operation, it was thought that the

automatic equipment should take care of itself and that very infrequent inspection would be all that was required.

Well, that is more or less the case; you can get by that way; but experience has taught us that it is better to make a quick, brief inspection of the fundamentals in that station daily, that one man can cover all of the stations on the system and do that and that by so doing we simply prevent accumulation of a number of minor items which, in the final analysis, may combine to cause the difficulty, so that the automatic stations are checked up in various ways. 6290

For example, we obviously have to keep them clean so that the janitor and helper is in there at very frequent intervals.

—2,696—

He is an old, experienced employee and would observe anything of particular irregularity, such as overheating equipment or smoke.

During the day there is always a man that comes in on a meter reading, removing and replacing some charts. He is instructed to observe certain things and at least once a week a complete check-over is made in the automatic D. C. stations, so that there are not very long intervals in which 6291 nobody is in the sub-station, but the total man-hours of operators in any one station are not very great.

Q. Are your distribution sub-stations of adequate capacity for present loads and for presently anticipated loads? A. I haven't available the exact statistics on the per cent. loading on all of these stations other than those that I have given previously, but, in general, they are entirely adequate and are kept so.

The way this is done is that the annual peak load is taken off of each station for the preceding twelve months and com-

pared with the previous year. We observe the rate of increase of both kilowatts and k. v. a.; as a result of those comparisons, we provide in the annual budget for additions or transfer of load, as the case may be, so that the same reserve factor will apply the following year.

In that way, we never allow the load to increase beyond a specified amount.

—2,697—

6293 This type of operation requires continuous care and must be kept up because the use of total average load statistics is not sufficient.

The system load can, for example, be constant and yet one sub-station might, for some reason, have an increasing load that year and another one might have decreased due to some peculiarity and it would not be observed in the total.

So you have to observe the variations of load in each of the sub-station areas.

Q. What contribution has the Union Electric Group made to the field of operation of distribution sub-stations? A.

6294 The Union Electric group was one of the early operators of any automatic equipment of this type and, I believe, the most extensive operator in the earlier years.

Naturally, as one pioneers the use of equipment, the pioneers make some improvements and, in our case, it was essential to do so.

We did develop a number of applications. I can mention several. One, the method of operating two or more automatic direct current machines in parallel on the same direct current bus using an automatic load-shifting scheme to make each machine assume its proper share of the total load.

6295

This is not a particularly elaborate device, but it has been very effective. In the ordinary arrangement there is what is known as an equalizer bus. This little scheme was an

—2,698—

adaptation of automatic control to insure that the load was divided as required.

Two, we were one of the first people to use bi-metallic element thermostats to protect machines and transformers against overheating.

6296

Those thermostats and devices were manufactured in our own utility shop and at least one or two of them were later incorporated into commercial devices which, I believe, ultimately became the Minneapolis Regulator control thermostats, but I think the first application of one of these was on one of our transformers.

Today, that sort of thing is standard practice.

The use of pressure wire bus in connection with automatic voltage regulation in direct current automatic substations gives better regulation at all points on the direct current system. A little more clearly explained, that means

6297

we carry a potential wire, a small wire, from different points on the system, which carries the voltage back to the substation, this particular wire not carrying any appreciable current, so that the voltage back of the station will be the voltage that exists out on the system and, with those wires, we are better informed as to the system voltage and can operate accordingly.

The newer A. C. network systems are following that original idea and providing rather elaborate intelligence transmission circuits to give information not only as to voltage,

6298 *Stanley Stokes—By Respondents—Direct*

but heating or overheating the transformers and many other

—2,699—

bits of information that it is desired to have.

Another item was to use automatically operated dampers to cut off the air supply in case of transformer fires or fires on rotary converters.

You see, when you operate attendant sub-stations in which you had men operating, if a fire started in the building, why, you knew that the man had sense enough to either try
6299 to put it out or report it.

Well, the thing was first brought to our attention with a small fire in an automatic station and nobody said anything about it. By the time we got down there, the machine was pretty well damaged, so we incorporated devices to send out an alarm to the main office but, from the experience we had, we realized that that was not enough and at the same time, this device cuts off the air to the machine by automatically closing dampers.

At the same time it takes the machine off and clears it from the circuit. This eliminates the chance for the fire to
6300 gain much headway until someone can get there.

Also, they have CO_2, carbon dioxide, equipment, which will automatically operate to put out fires.

The CO_2 equipment is not our development, nor contribution. Our contribution was the use of the automatically controlled damper. That was quite valuable.

—2,700—

Another item, use of vacuum tube-voltage regulators to control automatic rotaries and motor generators on the direct current system. Although we did not invent the idea, nor the

6301

equipment for automatically reclosing an oil switch on outgoing feeders, we were one of the earlier users of large quantities of these switches and found them to be very inaccurate in their operation and undependable.

We were able to improve the reclosing equipment. This was applied successfully to the South Broadway Sub-station as early as 1920.

Q. Are they effective now? A. Oh, yes. Yes, I mean, the people are using those things now without knowing where they are getting them. They are regularly applied on equipment today by manufacturers, but when you are the early user of these equipments you have to do it yourself and when you do, you contribute something to the art.

6302

In the electrical industry as a whole, I refer to the utility industry primarily, there is a great freedom of interchange of ideas, facilities and information. By that I mean that the utility industry has never attempted, to much extent, to patent and tie up such ideas; particularly among the members of our North American group we interchange such ideas quickly.

6303

If we develop these things, we tell the others about it the very first time we have any kind of a meeting or get-together.

—2,701—

If there is anything that is any good, we use it. If it turns out to be no good, we all quit it.

Another development was the adoption of steel barrier walls, an isolated phase arrangement for automatic steel distribution stations, as early as 1925. I was responsible for the design of that particular station and, at the time, it was thought by most engineers and operators that steel would

in some way cause a great deal more trouble, when arcs were started, than concrete which had been used almost universally for bus structures.

We put in this station and had no opportunity to find out for a couple of years whether there was any operating advantage. We knew that there was a major construction advantage and that we would have a better job.

Finally, one day, the manager of this particular property —it happened to be Alton—decided that he would make some
6305 changes in the station arrangement, and in order to be ultra-careful, he moved into the station an external oil switch, set it up, connected it up and made connections preparatory to transferring the circuits through this switch so that he could be doubly sure that nothing would happen.

He had an extra source with which to clear the circuit. He then took his last lead, put it on an insulated stick—what is known as the Johnson Clamp—and clamped it on to the bus. After having gone to all that trouble, he made one rather fundamental error—he forgot to open the oil

6306 switch and when he clamped that thing on, he had a dead short.

Fortunately, he was far enough away from it that it didn't get him and after it cleared, the situation showed that the steel barriers, which had a hole burned in them about an inch and a half in diameter, had withstood the arc and the repair of that was a very simple matter with an ordinary welding torch and the man's life was probably saved, because, had that been concrete, he could not have gotten a complete contact. The arc would have played around quite

a bit, would have flared out and, no doubt, gotten him, because we have had other cases in a matter of such type.

So we were convinced that the steel barrier was satisfactory.

The various companies have adopted that since and we are very favorably inclined toward it, even for major power-plant installations. Several North American properties are using it to advantage.

I have one or two other items which I had intended to mention. 6308

Another item. We helped develop, as well as install, recording devices in automatic closing timers. A timer is a device which determines the interval of delay in a reclosing automatic circuit breaker.

In other words, whether it should reclose immediately or

—2,703—

wait a few cycles or how it operates. It is controlled by what is called a timer.

In order to obtain a record of what actually took place, we developed a little automatic device to be incorporated in these timers. 6309

It is interesting, when difficulties are cleared, to know what took place, because you learn thereby and can avoid it the next time, and it is impracticable to employ such devices as these automatic oscillographs which we have mentioned where you have such a large number of applications.

Another point, which is not a matter of development of apparatus or pioneering, but a device to adopt a certain practice—in other words, we rather early adopted the reclosing cycle for 4,500 volt circuits at a time when it was generally regarded as more or less impracticable.

6310 We said, "Why wait so long? Why not close them right in and restore the service in most cases?" And the same type of reasoning is being applied now to higher voltage circuits. That is, today, very common.

We set up a test circuit and ran it for some months and found that no damage occurred and that we did improve the service and the device was made to do it on all of the feeders. The use of 33,000 volt cable connecting the transformer at the source with the receiving transformer with no high
6311 voltage switches was adopted many years ago by our company as more or less standard practice.

—2,704—

We have, to date, found no reason for changing our view. It has a very good feature in its elimination of high short circuits as well as the reduction of high voltage equipment. Any simplification of equipment should result and does in obtaining better service.

Some years ago, there was quite an investigation made by the American Telephone & Telegraph Company as to the major short circuits that had occurred in different cities in
6312 the country and the Commission was sent to St. Louis to investigate us for the simple reason that no complaints had been had by the Telephone Company as a result of high short circuits in our district.

Q. Sent by whom? A. By the American Telephone & Telegraph Company.

The reason for this investigation was that somewhere, I believe, near Chicago, there had been a heavy short circuit in a cable which induced a high potential in a wire leading to the telephone exchange.

6313

This caused a flash-over in the telephone equipment and which, in itself, would not have been particularly serious, but it frightened the girls and they all ran for the stairway and there were some girls either injured or killed and the telephone company wanted to avoid any possibility of such a recurrence.

—2,705—

The conclusion that they reached, after having been at St. Louis only a few hours, was that there was no reason why we should have any high short circuits the way our 6314
system was designed and that the explanation was obvious, that we did not tie together a great quantity of equipment and subject all of it to the full capacity of the plants.

This, to some extent, at least, in my opinion, was an additional justification for our methods coming from an independent source.

(Discussion off the record.)

A. (Continuing) Another item of pioneering application was the use of an automatic transfer, 138,000 volt sub-station unattended, fully automatic, including 33,000 volt 6315
automatically regulated bus, and a number of outgoing feeders.

The application of this station, which was installed about two years ago, included a number of original features. I, personally, am not aware of any other station of just this character at that voltage operating fully automatic.

The service obtained from this fully automatic station does supply the outgoing lines with a continuity that could not be obtained by an operator if he were there, because it

6316 *Stanley Stokes—By Respondents—Direct*

requires a selection and changing in the time of operating switches in a period of less than eight cycles.

That is, in other words, this station has to select between two ways of operating the switch and do it in less than

—2,706—

eight-sixtieths of a second or it can cause difficulty. No operator could do these things if he were there; he would have to depend on the equipment.

6317 One other item was the use of a directional distance relay for ground fault protection. That, we believe, we were the first to apply on a major system and it required many modifications before it was fully effective.

This relay, in conjunction with some other similar devices, really represents the brains of this automatic station that I have been describing.

Q. And you have already referred, have you not, to the use of ground relays on regulator frames as a means of reducing fire hazards? A. I did refer to that. It is one of those cases where I am not able to show a positive proof

6318 of the extent to which it is valuable, but the negative proof indicates a situation that if we have, in the operation of that device, as much as, say, four or five times—if any one of those five times had functioned the same way, without the device in the regularly stated service—the particular kind of regulator to which I refer was known to be subject to explosion under the conditions in which it was used.

If any one of those occasions has saved a regulator explosion, the device was a real contribution.

—2,707—

Q. I think you have already mentioned, briefly, the proposed change over at Fort Madison, Iowa, from 25 cycles to 60-cycle power. You might just comment on that very briefly, if you will, at this stage. A. 25-cycle service is not as satisfactory for lighting as 60-cycle service, and as I have previously explained practically all of our 25-cycle service is used for industrial applications or street-railway load where lighting, itself, is not involved.

There are one or two relatively small towns in Iowa, which got service in the early years at the time the dam was 6320
constructed, which have the 25-cycle used for general distribution. We are now proceeding to eliminate that and convert it to 60 cycle without any expense to the community.

Q. Now, does this result in better service? A. It results in materially better service to that community but involves some very important expenditures on our part. I would like to describe that situation. We had to put in a 6,000 k. v. a. sub-station, frequency-changer job, rebuild a small plant at a cost of about $152,000 but in addition all of these customers had an abundant supply of appliances which would not operate at 60 cycles. 6321

After having used the greatest care in trying to convert some of the equipment to 60-cycle operation, having made a survey of all of the equipment, we still had something over $200,000 worth in just one small town which we had to furnish. There was no one else to do it. Since it is property

that we aren't going to own, you have to look on it almost as a gift to the customer. I don't see how you can regard it any other way, but it is one of the essential features of

such a change-over. The company undertook that obligation.

The city of Fort Madison, itself, is having its distribution system completely redesigned and the transformer connection and such other changes made as are necessary to provide 60-cycle service in pla[illegible] of 25 cycle.

Q. Turning now to the distribution system, itself, I think you have given previously an overall statement of the number of customers served by the Union Electric group. Are you able to classify those customers in general by the county
6323 in which they are located in order to indicate the density of service in a particular county? A. The particular date as of which I have this information is December 31, 1939. The total number of customers as of that date is 349,096, distributed geographically as follows: City of St. Louis, 202,308; St. Louis County, Missouri, 74,674; St. Charles County, Missouri, 3,633; Franklin County, Missouri, 4,773; Jefferson County, Missouri, 7,794; St. Francois County, Missouri, 5,254; Lakeside Division, Missouri, 286.

Q. Now, that Lakeside Division you just referred to, is that the territory around the Osage plant? A. That is the
6324 territory immediately adjacent to the hydro-electric plant

and the Lake of the Ozarks. That was just a natural outgrowth of the construction of the dam; the residents in the vicinity wanted to obtain electric service and we supplied it.

East St. Louis and Alton Divisions, 39,090; Keokuk Division, 11,284, which totals to the previous figure.

Q. I think you have previously given the distribution of customers by classifications of service, but I don't think you have stated the amount of kilowatt hours taken by the

respective classifications. Are you able to state the number of kilowatt hours so taken by various classifications within your own rate schedules? A. I can subdivide that to about 6 or 8 classifications. The annual sale of kilowatt hours, based on the year ending December 31, 1939 is: residential classification, 309,987,615; commercial classification, 237,653,585; street lighting, 34,102,442. The combined total for those three classifications is 581,743,642.

Other public authorities, 13,548,642; other electric utilities, 401,412,412; railways, that is the street-railway load, 6326
123,506,900; combined total for that group, 538,406,954.

Large industrial classification, 1,020,297,591. The combined total for all classes for the year 1939 is 2,140,509,187.

We are having a very rapid increase in kilowatt-hour generation this year and I believe that that 2,100,000,000 figure has already gone, I think, even beyond 2½ billion at

—2,710—

the rate it is going. If we compare that with the year 1919, at that time, 20 years ago, we had 353,185,617, and in the year 1919 we had 112,484 customers compared with the previous figure of 349,096 for 1939. 6327

Q. At what voltages is electric energy distributed by the group? A. The general lighting service in all areas is distributed to the customer at 120/240 volts. By that we mean that where you have three-wire service the potential between the two outside wires is 240 volts and the potential from either outside wire to the middle or neutral wire is 120 volts.

The larger-sized motors are operated on the 240 volts and the lighting is always on the 120 volts. A small customer will obtain only two-wire service, which gives him 120 volts.

6328 *Stanley Stokes—By Respondents—Direct*

Now, in the alternating current, secondary network for the high density city service, the voltage is, single phase, 120 volts and, three-phase, 208 volts. Power service in practically all areas is either 240 or 480-volt, 3-phase voltage.

Industrial-power service is delivered at the primary side of the distribution transformer at 4,160, 13,800, 33,000 volts, 60 cycles or 13,200 volts, 25 cycles depending on the particular district in which the service is rendered. That means that the customer has the meter on the high voltage
6329 side of the transformer and distributes his own feeders in the factory or wherever he wants to and does his own transformation. —2,711—

Q. And the street-railway load is at what voltage? A. It is practically uniformly supplied at 13,800 volts, 25 cycles.

Q. Your statistics on sales kilowatt hours indicate a fairly substantial street-lighting load. Can you comment on the extent of the street-lighting distribution? A. The largest user of street lights, the city of St. Louis, owns and operates its own street-lighting system and purchases power from the Union Electric group. This power supplies some 50,300 street
6330 lamps in streets, parks and public places, such as bridges and alleys, all of the power coming from the Union Electric group. The lights and equipment on the municipal bridge, a number of alley-lighting systems and a few private systems in the city are owned and operated completely by the Union Electric group. Outside of the city limits, that is in St. Louis County and various other locations, the Union Electric group owns and operates the street lights, themselves.

The city of Kirkwood, which is a municipality, owns and operates its own street-lighting system and purchases the

6331

power from the Union Electric group. Clayton, Missouri and Washington, Missouri each own a few lights in their business district and all are supplied from the Power Company System.

Q. By that you mean by the Union Electric group? A. By the Union Electric group.

—2,712—

In the street-lighting equipment, which is owned and operated by the Union Electric group, there are a total of 65 circuits serving over 6,189 lamps, 1,941 of which are ornamental standards supplied from underground cables. The remaining 4,248 are overhead fixtures supplying aerial circuits. This latter group is about equally divided between bracket-type fixtures and center suspension.

6332

Most of these circuits are supplied from 6.6 ampere, constant current, street-lighting regulators. Although there are some variations in some cases, the larger lamps are handled from 20-ampere transformers in the ornamental pole itself.

Very few of these operations are carried on with the multiple circuits, only in some remote districts where no street-lighting circuit was available.

6333

15 of the 65 circuits are controlled by time switches in the various suburban distribution stations, the remaining 50 originate from series regulators installed along the distribution feeder. These are automatically controlled by time switches, the more recent of them using a separate relay and an oil switch, mounted at different locations from the relay.

(Discussion off the record.)

6334 The Witness: The street-lighting circuit, as a rule, causes very little trouble; most of these circuits are equipped with sectionalizing devices. If any trouble or anything happens to the loop, that loop of the circuit is cut out and the rest of it goes on, and it is very

—2,713—

simple to operate and leads to very little difficulty. The service on the street-lighting circuits, as they are designed and maintained today, is very reliable.

6335 Of course, it involves a constant maintenance and cleaning schedule to keep the equipment and the lights in good order. There are, also, some street lights in East St. Louis and Alton, Illinois which are maintained and served by the Union Electric group.

A few of the Whiteway Systems, including 479 standards owned by the cities, are operated on energy purchased from this same Union Electric group. In Keokuk and other Iowa communities there are about 1,530 lamps owned and operated by the Union Electric group. That is about all of the street-lighting equip-

6336 ment.

By Mr. Hamilton:

Q. What type of distribution is employed in the distribution system? A. The distribution system, as previously described, is a 2,300/4,000 volt four-wire radial-type system which, as a rule, is regulated by induction feeder regulators at the sub-station. The urban-type feeders, those in and around the city, are all operated with the single-circuit oil switches as previously described. The rural circuits do not all have the automatic reclosing feature.

In connection with the city and urban-type feeders, St.
—2,714—
Louis is outstanding in its use of heavy conductors; that is, the standard conductors that we have the greatest mileage in are the 4/0 size, whereas some cities depend on a 2/0 as a general rule.

We have done some experimental work in using a 750,000 cm. feeder for the very heavy distribution and are not convinced as yet as to whether it is practicable or not, but we have a number of 500,000 circular mill feeders operating 6338
successfully. This large-sized conductor is only feasible in the areas where the load is quite dense. There is no fundamental difference in design in the suburban-type feeders as distinguished from the city feeders except that the conductor is usually the smaller size. This same comment would apply to rural feeders, but in their case they usually have some form of fuse, frequently an automatic-repeater type and the feeder, itself, is of lighter wire.

Urban and suburban feeders are all closely physically interconnected so that the loss of one feeder can be picked up by adjacent ones. The design of such a system has to con- 6339
template that practice and we have a regular practice of providing from ¼ to ⅓ excess capacity in these feeders so that two or three feeders can always pick up the load of one more. It is equivalent to providing a reserve circuit for not over 3 feeders as a rule and always one reserve circuit for four.

This distribution system has had a rapid increase in its
—2,715—
size. Since 1919 to 1939 there has been a very large percentage increase in a 20-year period. I should like to de-

scribe that with respect to several classifications: Poles, December 31, 1919, there were 41,958 which by 1939 had become 147,116; Miles of distribution wire in 1919 was 8,379, this has increased to 29,757; Single conduit in miles, 810 had increased to 1,306—the conduit, itself, may have more than one duct but in this case I am giving it per duct mile; distribution cable in miles, 552 and 886. The set of the majority of this system is overhead and not underground. Meters have increased from 116,495 to 374,548.

6341 Q. Now, without going into any particular detail and since it represents a very important part of the total enterprise, could you comment briefly on the development of the distribution system to amplify the statistics which you have given? A. I believe that in previous testimony describing the general features of the company that I made some partial reference to the early activities, although I do not believe that I gave but just a mere mention.

I would like to include at this point that St. Louis was one of the oldest pioneering electric users in the country and that the Missouri-Edison Electric Company by 1898 claimed

6342 such outstanding achievements as the operation of alternating current generators parallel, use of induction-feeder regulators, distribution of power by means of an A. C. network and the operation of the world's largest A. C. arc light

—2,716—

station.

Q. Was the company to which you have just referred by name a predecessor of the present Union Electric Company? A. It was a predecessor of the present Union Electric Company of Missouri.

The early system bragged about their load factor of 20 per cent. compared with our present-day load factor of 60 and stated that in their early records that they were active in the promotion of the sale of single-phase motors, so to that extent we are still at it.

There has been a gradual change, as the years go on, as to the standards for the utilization of voltage, that is the voltage at which the lights are operated. In the early years the majority of all lamps sold were sold at from 100 to 110 volts. Then the sales gradually shifted and for many succeeding years and up until the last, possibly, five, the greatest percentage of all lamps sold fell in the 115 volt class. 6344

For the past five years much more than 50 per cent. of all lamps sold,—I think it exceeds 60 per cent. today and possibly a little more,—were sold at 120 volts regularly and this is the voltage at which both utilities and manufacturers would prefer to remain. Our system has been brought in line with this recent standard and the lamps now being sold throughout the Union Electric Company group districts are 120 volts.

This is an important item because you can't afford to have 6345

two or three different types of lamps being sold, because you never can tell where they are going to be used. You can't control their distribution once they leave your hands. Besides, others sell lamps in ordinary stores, consequently, if there were two lamp standards in the district there would be bound to be some of them missupplied. If there were two lamp standards such as 115 volts and 120 volts it would always cause difficulty. We have made very special effort to get our system into the condition where the voltages

6346 *Stanley Stokes—By Respondents—Direct*

delivered on the various distribution circuits are all suitable for the 120 volt-standard lamp. That lamp will operate successfully for two or three volts above that rating and three or four volts below. It will stand more voltage below than above to operate equally well. In other words, the mean voltage for which that lamp is designed is probably 118 volts.

The studies that have to be made to keep a distribution system up to date and in good condition are voluminous. You have to constantly keep at it, study the trend of the
6347 load, the rate of load growth and the load growth by areas and keep your reserve equipment at the proper percentage in all the different areas.

The purchase and installation of electrical equipment does not, of itself, guarantee good service, that is something that we have learned over many years, that you have got to constantly study it and keep it in condition and keep it adequate, keep ahead of your load.

—2,718—

If a transformer is severely overloaded for a number of years and burns up, that is not the transformer's fault, that
6348 is because somebody did not do all of these things which I have indicated and we make every effort to follow continually this type of inspection.

One of the first things you have to know is the voltage condition on your system. For many years a large number of companies depended entirely on complaints from customers, so-called voltage complaints, to determine whether or not their service was satisfactory.

I would like to relate the reason why that is not particularly a good way to do it. We checked up our voltage com-

plaints for a three-year period. We classified them by the nature of the telephone call and the Distribution Department analyzed those figures and seemed to be able to make nothing of them. They seemed to be very inconsistent. I turned the whole group of figures over to one of my assistants who is interested in frequency distribution and probability curves and such matters.

He plotted the record of these complaints in the form of what is known as the frequency curve with what was then a rather surprising result. It was that the greatest number of 6350
complaints came at the point of rated voltage,—in other words, if 115 volts was our standard voltage that we were trying to deliver. After these complaints, you understand, we went out to measure the voltage, checked it up. The largest number of complaints came at the point where the voltage

—2,719—

was the best. This is easily explained if you think just a moment.

If you have 10 customers on an electric system getting 100 volts and 10 customers getting 130 volts and if all 20 of those complain, you wouldn't get anything like the num- 6351
ber of calls that you would from 350,000 customers who think that the voltage is wrong and who call up for some reason. When we get out there we usually locate the reason, but the answer is you are going to get more trouble calls because there are more people. If you have a good system and well-regulated voltage, you are going to have a very high percentage of all the customers on the system there get that voltage that they are supposed to get and if you take 350,000 customers they are going to call up about

6352 *Stanley Stokes—By Respondents—Direct*

something, usually because of some of their interior wiring or their fuses are out and something else is wrong. The management checks that, but it isn't the conclusion that you would arrive at without having checked it up.

(Discussion off the record.)

The Witness: (Continuing) But it is a fact that you can not afford any longer to use customers' calls as an indication of voltage trouble, you have to go and

6353 measure it.

By Mr. Hamilton:

Q. In order to get a comparative idea of the constant additions and changes that are being made in the distribution system, are you able to state the amount of retirements and additions that have been made to the system in a par-

—2,720—

ticular year? A. Yes, I can state the figures very closely for the year 1939. The distribution system additions were $3,700,000 and we retired $1,100,000 for the same year. The

6354 continuous development of additional load and other improvements, particularly highway improvements caused us to spend a very considerable sum of money every year in addition to which we have an arrangement with the city whereby we remove every year five miles of overhead circuits. That should have been independent of whether we need to remove them. We do it anyway and thereby reduce the mileage of overhead lines in the city and we do not add any. The result is that in a very definite number of years all of the overhead system will have been removed from the city streets without any hardship to anyone.

6355

Q. You are talking about St. Louis? A. I am talking about St. Louis city.

The expenditures brought about by civic developments and other requirements amounted to $80,900 in the year 1939, and this figure, or even a larger figure, is applicable almost every year in some manner or other as our share in the civic programs.

Substantial losses are occasioned by the removal or abandonment of existing plants under some of these changes which are particularly applicable in the last two or three years.

6356

—2,721—

For example, we have a Jefferson Memorial Project along the river front of the Mississippi River, in which many square blocks of buildings have been razed, and are to be replaced by some form of memorial. The exact plan has not yet been determined. We had to remove all of our service out of that area, and we don't know what we are going to have to put back, but our estimates indicate that our retirements there are likely to run about—they could run as high as $370,000, and they won't run less than $150,000—and the additions have been variously estimated at $190,000.

6357

Now that is merely one of these city improvement projects. There will always be certain projects of that kind going on every year, and we have to cooperate with the city and keep our service requirements up with their developments.

The Examiner: We will have a recess of five minutes.

6358 *Stanley Stokes—By Respondents—Direct*

(Whereupon, a short recess was taken, after which the hearing was resumed.)

The Examiner: Let us resume.

By Mr. Hamilton:

Q. In designing the distribution system, is it necessary to take into account the occurrence of storms and weather hazards? A. It is. The design of a distribution system—I am referring now particularly to the overhead poles and
6359 wires—does not contemplate storms of tornado proportions. It is impracticable to design for such loading, and as a

—2,722—

result of much study over many years, certain standards have been agreed upon and are published in a circular issued by the Bureau of Standards, known as Bulletin No. 54.

That sets out the types of approved construction for certain areas in which the loading may be either Light, Medium, or Heavy. We are in the Heavy loading district, and carry out the same type of design for these poles, and
6360 with just as great care as we do for our major transmission towers.

The reason for that is obvious, that there are so many of the poles and wires and cross-arms that the total investment is very large, and that you can not afford to leave a big factor of ignorance in your design.

In the early days when poles were very cheap, and the best ones could be had without difficulty, it probably didn't pay so well to spend too much time in design. Some of the early systems were just built. But a little at a time, we found out exactly what poles would do, and the various

timber is tabulated, allowable stresses are all available, and we try to stay within a reasonable factor of safety for what is known as Class B, or Heavy loading.

There is an allowable variation in such design in which you can, under certain conditions, operate your conductor at higher stresses. We prefer to operate and design our conductor for what is known as 50 per cent. of the ultimate strength. This is a conservative design. We could go to 60

—2,723—

per cent. without exceeding the code. 6362

The unequal design of structures in a distribution system, does no one any good. It is a waste of money. If you have a pole that is a great deal stronger than either the crossarm or the wire, or vice versa, you don't gain any increased effective strength out of it, and you do spend money. So the ideal system is one in which the individual structures are carefully engineered and watched. It does not require an unreasonable amount of time, and you should get a design that is consistent.

If you want a stronger pole, design for it, but keep all of the strengths in a consistent relationship to each owner. 6363

Another thing that is of great importance to an electric company is the life that you get out of these poles. That again requires that care be used in the treatment of the poles, that is, as to their impregnation. If you are using yellow pine poles, you have to be careful that you get a high-grade pole in the beginning. That means that you must have specifications on which they are purchased, should have inspectors where they are being treated, and you should see to it that the pole is what it is supposed to be.

6364 *Stanley Stokes—By Respondents—Direct*

If a properly treated pole of good quality—and by good quality I mean a tree that was not grown in a swamp where they grow so fast that there are very few rings per inch, and

—2,724—

the wood has no strength—you can take a piece of fir, which has been grown in very wet soil, and it may only have 5 or 6 rings per inch, and it has all the characteristics of a Nabisco wafer. If you squeeze it in one direction it will crush, particularly if it is wet. That type of timber will not last.

6365 Now then, if you get good timber, and have it properly treated, and if your hardware is carefully selected, you get an effective life out of all proportion to a carelessly done job. That is why continuous attention and intelligent analysis pays well.

We try to do the very best job with that that we can.

The theories of operating electric companies are frequently stressed, and sometimes not enough attention is paid to keeping up and every day applying some of the theories that are enunciated. It is easy to state a theory, but it is hard work, day after day, to adhere to it.

6366 I think the latter is the one that probably has almost as much effect on the ultimate service as the spectacular things that are done occasionally.

The tornados which have visited our areas at various times have been pretty severe, but it is a fact that the service interruption, particularly in the tornado of 1927 with which I am familiar, it tore a swath right through the City

—2,725—

of St. Louis, and it blew in one end of our Venice plant and blew out the other, blew the roof off, blew the east wall,

which was a temporary metal wall, about two miles into an adjoining town, Granite City; and did a number of very peculiar things.

The operator who saw the wind coming up rapidly, ran in under a balcony and the wall fell in on the turbine, which had just been shut down, but he wasn't hurt.

Another operator heard a buzzing noise, a whirring noise, and he thought the rotary was running away, and he ran over to attend to that, and it was under a heavy concrete balcony, and he wasn't hurt. 6368

The noise was due to the running away of a ventilating fan which was in the end wall, and was being driven by the wind, and it threw its blades all to pieces, and one of them cut through an oak rail about an inch thick.

The outdoor substation, which we had just completed about three weeks before that, was completely blown away. One board was driven from a lumber yard across the river half a mile, and penetrated a transformer tank.

Q. I was just going to inquire whether these calamitous circumstances happened with any frequency? A. No, but I wanted to illustrate what really took place with respect to service. 6369

But with all of these factors involved, the number of

—2,726—

people who were unable to obtain service, and who wanted it, were very few. Keep in mind this, that this plant was completely duplicated by others, and the loss of that Venice plant did not affect anyone.

All of our major distributions underground, and the areas on either side of this swath, knew nothing about it,

6370 *Stanley Stokes—By Respondents—Direct*

and the people within the particular area, which was about a quarter of a mile wide,—and this doesn't go continuously, it left and came back down again in two or three places—they did not require service because the buildings were destroyed or damaged, and we were able to restore the situation to normal with a very moderate loss of service.

I can say, as far as I know, that we received no complaints.

—2,727—

6371 At a time like that, the public does not complain, they understand what is going on and they compliment you on the quickness with which service is restored.

Now, of course, a tornado like that has occurred only twice in St. Louis, once in 1896, which didn't do as much damage, and one in 1927.

We have had major sleet storms, one in 1916 and another in 1924, and we had a 30-hour downpour in 1915. Those all caused more or less trouble, but that represents all of the calamitous storms of those proportions that we have been able to locate as far back as we can find any records, and the

6372 loss of service under those conditions is not severe, and we get all of our crews, accumulate any construction crews, and restore the service as quickly as possible.

In one particular case, I was building the Crystal City transmission line from Cahokia to Crystal City, and I had around 160 men on that job. There was another construction job under way, and this sleet storm of 1924 hit the city. It didn't bother the city very much, but it bothered the outlying territory more. A heavy sleet like that is a matter of 1 degree of temperature, and the city temperature was run-

ning 1 to 1½ degrees above the surrounding territory, and the sleet didn't form heavily in the city.

We put that crew of 160 men from this transmission line job, as assistants to the regular crew, and we cleaned up that

—2,728—

area there in very short order.

So that, in times of emergency we do the very best we can, and we think we do a very creditable job. Those don't occur except at very rare intervals.

6374 Q. Your testimony so far has covered the major classifications of the property of the group. In order to complete the story, however, will you indicate very briefly the nature and extent of the general purpose facilities which the Union Electric group owns and operates? A. In running a system such as that operated by the Union Electric Company of Missouri and its subsidiaries, the Union Electric group, there are required a number of other facilities not specifically engaged in handling electric current.

There are numerous general purpose structures of which the following list which I propose to read, will be an example. This classification refers to offices for general office purposes. 6375

In the City Division, we have 5 offices including a large central office building.

In the St. Louis County Division, we have 5 offices, including their main division office at Webster Groves.

In what we refer to as our outlying divisions, and that comprises the counties surrounding the City of St. Louis and St. Louis County, there are 9 offices. Those are located in

—2,729—

Franklin County, St. Charles County——

6376 *Stanley Stokes—By Respondents—Direct*

Q. (Interposing) How many officers do you have in Franklin County? A. We have four offices in Franklin County, one in St. Charles County, 2 in Jefferson County; 2 in St. Francis County; 1 in St. Charles County—the office in St. Charles County operates for the 2 companies in St. Charles both of which are direct parts of the Union Electric Company of Missouri, and the second one that I mentioned had to do with an office for the St. Charles Electric Light & Power Company, which is one of the Union Electric group.

6377 Another office is at Lakeside, Missouri, for the Lakeside Light & Power Company. That is right on the edge of the county line, I think it is on the edge of Miller County, but I can't say definitely whether Lakeside is in Miller County or just over the line. That doesn't matter and it is very close to that point.

The Union Electric Company of Illinois has three offices, one at Alton, one at East St. Louis, and one at Hartford.

The Iowa-Union Electric Company, and the Mississippi River Power Company, together, have six offices located in the towns of Keokuk, Ft. Madison, and Dallas City, Iowa.

6378 Q. Now, in general, what is the nature of these offices? A. They are offices——

Q. (interposing) Are they general offices? A. General

—2,730—

offices at which the clerical work, billing, accounting and headquarters in the smaller divisions, as well as the points to which the foremen of the operating division would report.

In addition to such office building, we have arrangements made, either in our own offices or in buidlings owned and operated by others, whereby customers can conveniently pay their bills. There are a large number of such pay stations.

6379

I might summarize those to indicate the extent of them. The City Division of the Union Electric group has 69 pay stations. The St. Louis County Division has 42. The outlying divisions have 36.

Q. And those points at which payment can be made are distributed, are they, throughout the territory? A. Distributed in the most convenient manner that we can devise for the benefit of the customers. There are a combined total of 158, if you will add 11 other miscellaneous offices not included in that group.

6380

Q. Now, very briefly, can you state the number of points at which trouble calls are received and repair crews dispatched? A. I have the detailed information on the places at which trouble calls can be received or dispatched, and I can summarize those.

In the City Division, they are all handled from the 12th Street office where we have quite a trouble force available at

—2,731—

all hours.

Q. Is that your main office? A. That is our main office and that is where the main force is concentrated, and where we have the extensive telephone facilities and everything that is required to carry on such work.

6381

The St. Louis County Division handles their trouble calls in a similar manner from their main office at Webster Groves.

The outlying divisions, which are scattered through these various counties, necessarily have to have available a trouble report point for each of the divisions, and that includes 9, 1 at Festus, 1 at Flat River, 1 at Washington, 1 at St.

6382 *Stanley Stokes—By Respondents—Direct*

Charles, 1 at Pacific, Bonne Terre, De Soto, Union, and St. Clair.

A similar point is located at the headquarters office in the town of St. Charles and trouble calls for Lakeside are handled at Lakeside.

The Union Electric Company of Illinois handles them from their three offices at Aiton, East St. Louis, and Hartford.

The Iowa Union Electric handles their calls at 5 points,
6383 largely at Keokuk and Ft. Madison, with a smaller quantity of calls handled at Dallas, Warsaw, and Hamilton. That is a point just across the dam, that is merely a matter of convenience.

In addition to points at which you can pay bills, and from which we dispatch our trouble men, we also have other

—2,732—

types of facilities, pole yards, for example, which are a very important adjunct to an electric company, where we store all our poles and some other facilities to go with distribution, so you don't have to haul very far to get to any par-
6384 ticular point on the system.

The Union Electric Company of Missouri has 14 locations at which such storage is kept; the Union Electric Company of Illinois has two; and the Iowa Union Electric Company has five, making a total, I believe of 21.

We also have garages. Some of them are rather large, extensive garages.

The Union Electric Company of Missouri has, in the City Division, two garages, one of which has just been completed and is a very modern and up-to-date garage, not only a build-

ing, but yard and other facilities including cranes, material handling devices, and other features, in which we have a combined group of facilities to handle both transportation equipment as well as material.

Q. Just give the total figures on this, if you will? A. For the entire Union Electric group?

Q. Yes. A. There are 13 independent locations at which garages are maintained in the Union Electric Company of Missouri.

6386

The Union Electric Company of Illinois has 3; and the Iowa Union Electric Company and the Mississippi River Power Company have 5.

—2,733—

In addition, we have storerooms, some of which are located at the same points as the garages, and some of which are not, but we are rather proud of our facilities and operations. They are very modern and up-to-date in all of the equipment which is expeditiously required to handle large quantities of material.

6387

There are, for the Union Electric Company of Missouri, 10 such storerooms; for the Union Electric Company of Illinois, 5; and for the Iowa Union Electric and Mississippi River Power Company—5. In addition to that, we have a number of repair shops which total, for the entire group, 4. One of those is a very extensive and complete machine shop with all modern machine tools such as milling machines and welding and cutting equipment. We do a large part of our own repair work in the shop. We have laboratory facilities for testing at 5 locations for the Union Electric Company of Missouri; 1 for the Union Electric Company of Illinois; and

6388 *Stanley Stokes—By Respondents—Direct*

2 for the Iowa Union Electric Company and Mississippi River Power Company combined.

These laboratories are primarily for meter testing, but along with that type of testing they do various other testing, usually electric. They test rubber gloves and they test electric ranges and test new appliances, and all forms of electric testing. We do not maintain an ordinary mechanical

—2,734—

testing laboratory such as is used for cement work, and so
6389 on, as I explained previously.

Q. These all-purpose facilities are distributed rather generally, are they, throughout the territory? A. Yes, they are generally distributed, but I wouldn't want it thought from that, that they are carelessly distributed. They are in selected locations, selected with great care. You see if we can analyze the number of trips made to and from these yards, after we get several years of experience, we can indicate the possibilities of economy if the locations are changed. We have had occasion to change very few, practically none. There is only one yard that I know of that has been con-
6390 cluded to be in not the best location. This new one will take care of that.

But the location of a pole yard receives careful study and analysis as to where those poles are going to go and how much haul there will be from that point, and we try to pick them so as to produce the minimum amount of haulage and travel.

Q. The location of the pole yards may determine to some extent the speed at which a repair is made? A. It would. We do not know of course at what point repair work of

an emergency type is going to be required. Therefore, we have got to have these yards properly distributed so that no point on the system is excessively removed.

In general, however, I think the greatest economy is ob-

—2,735—

tained in the location where the normal operation, every day, of hundreds of trucks hauling this material, will not produce an excessive mileage.

The light type of trouble work is not entirely related to these pole yards. The trouble man would get to an emer- 6392
gency in a light car anyway. He would be dispatched from a garage. If the service was of some particular major importance, if there had been some severe breakage of a pole, or something like that, that pole would have to be delivered from the nearest point.

Q. Now, very briefly, if you will, the nature and extent of the transportation and construction equipment of the group? A. The transportation equipment is an extensive item in a company of this type, referring to the Electric Company of Missouri, the Union Electric Company of Missouri and the group. We have quite a fleet of construc- 6393
tion and miscellaneous equipment. About all I could do would be to summarize it, the totals, to give an understanding of the magnitude of it. There are 198 passenger cars, 240 trucks, 72 of these large industrial trailers that are operated from a tractor, 6 tractors; 2 portable cranes, and one of those is designed to lift heavy loads and was specifically designed to install and remove and maintain these network transformers which have to be let down through a grating in the sidewalk from a truck located in the street, and

—2,736—

6394 *Stanley Stokes—By Respondents—Direct*

you cannot afford to obstruct traffic for any length of time in a busy area. That required rather special design.

We also have concrete mixers—6; and 14 of these gasoline driven air compressors on wheels.

The aggregate cost of this equipment is considerably over $600,000.

We selected the equipment with as much care as we can, keeping in mind all the time the application for which it is intended. We do have a lot of street and paving work to do,
6395 and concrete breaking and breaking of pavement, to get into conduit lines, and economy in that work is very essential, and machinery helps materially to do it.

Q. The list which you have just given includes trouble cars, does it? A. Yes, that includes—well, I listed passenger cars, but I am not quite sure whether that figures includes trouble cars or not. The trouble cars, as used by the individual trouble men, are passenger cars. I believe that that figure should include them.

Q. Do you mean "should" or does? A. Well, I can't say for certain whether it does or not but I can look that up if it
6396 is of any importance.

Q. Now, turning to the operations of the system, will you state the base load generating plants in the system and relate

—2,737—

the functions of the other plants to the operating of the base load plants? A. The answer to your question requires that I again mention the same power plants that I have previously mentioned from the standpoint of property, but with the intention now of stating something about how they operate.

The Union Electric group has this interconnected generator system consisting of the 6 plants, 4 steam and 2 hydro,

 6397

and the plant which is depended on for the higher load factor work is Cahokia, where the better equipment is available in quantity. In combination with the hydro plants, we assign to the different units in the different stations a load which they can carry most economically at the time.

The hydro plants in this system are constantly varying their output, and it requires a very close detailed attention to keep the steam plants fitted in with the requirements of the load, and at the same time utilize the hydro power insofar as possible. 6398

The operation of such a system is much more complicated than that of a straight steam system, and is somewhat difficult to explain in a limited time.

The first situation which we encounter in attempting to set loadings is that we have to find out what is the dependable capacity for different types of service of each of these plants.

The drainage area of Osage, for example, is not the same

as that for Keokuk. Therefore, there should be and is some diversity between these two properties. The Keokuk plant 6399 has limited storage, and that has to be kept in mind, and if there is any considerable amount of stream flow, that has to be used.

Osage has storage, but it has to be scheduled and used effectively to get the most good out of it.

The basis of our operation may be expressed by stating that as a result of many calculations and experience to date which is about 8 years, we are confident that we can safely assign, as a combination rating for Osage and Keokuk, the

6400 *Stanley Stokes—By Respondents—Direct*

ability to carry 200,000 kilowatts of our system peak for the entire period of the winter peak.

That is, not 24 hours a day, but to cut 200,000 kilowatts off of that peak each day for as many days as required.

—2,739—

The individual ratings of those plants, of course, are at various times much larger than that. You can get from 130 to 160 thousand kilowatts out of the Osage, and 135,000 out of the Keokuk plant.

6401 Now to illustrate the actual method of operation, Keokuk never gets below, in an ordinary year, say, 70,000 kilowatts. Any reduction below that is of very rare occurrence. That being the case, that 70,000 kilowatts of water power energy would either go over the dam or we must make use of it. So it is placed first, it carries what I would call the base load, 24 hours a day.

Then the steam plant, the best unit available at the time, probably 75,000 in our case, would be placed next, and operated at its maximum efficiency point.

Then the next less efficient unit, and so on until we
6402 finally get to the reserve plants, some of which may be actually shut down cold.

In certain years, Rivermines will not be operated at all. In other years it will be operated for a very short time.

Now that is the type of operation for which the Osage plant is primarily designed.

On the other hand, suppose that instead of having a very lean or dry year, and what we call a low send-out for water power, suppose we have a very good year. Also let us assume

—2,740—

6403

that we may have just installed a new large unit such as the plant which is now under construction. Under those conditions we would not have to reserve Osage specifically to cut this winter peak, we could use it any way we wanted to for that year.

And what we do do is to try to schedule the operations in such a way as to get the greatest number of kilowatts, kilowatt-hours, out of that plant in that year.

In the years just before such a unit is to be installed, the greatest value that Osage can be to us is to make a firm 6404
cut-off of this 200,000 kilowatts, even if we have to sacrifice a few kilowatt hours. The result is that in making that firm winter cut-off, we schedule the level of the reservoir by what is known as a rule curve. We have checked the rainfall for 60 years, we have checked the records the years the plant has been running, and we know what the minimum rainfall we can count on for the next certain number of weeks is.

It may be greater than that and probably will be, but that is the least.

Now, in pulling down the reservoir, you have got to watch two factors. One, you must not get it so low that you can't 6405
get it back full ahead of its winter peak, even though you have got the lowest rainfall on record. So whenever you get down to the point at which minimum rainfall would

just bring it up, th you quit drawing it down and start running your lower efficiency steam plants.

On the other hand, if you pull it down too far, then, even in an ordinary year where you are not concerned about the winter peak, in trying to get more rainfall in the reservoir

you may overdo the job and have the effect of operating your storage reservoir at a lower head than could otherwise have been done.

So it is really a very nice engineering operation and calculation day by day to watch this operation and see to it that the plants are scheduled to get the greatest good not only from the equipment, so as to keep fixed charges at a minimum, but from the hydro plant to get all the kilowatt hours you can, and from the steam plants to be sure you are
6407 operating the most efficient unit for the particular work at the time.

The usual way of expressing this operation is to state that a duration curve is constructed which can be described as a curve in which the ordinate is kilowatts, and the abscissa is hours per year up from zero to 8,760, or the total year.

The product of hours, times kilowatts, is kilowatt-hours, or energy. The result is that the area under this curve represents energy, and any particular height on the curve represents the kilowatts at that point, and the length over

—2,742—

6408 to the right of the curve indicates the number of hours per year at which that particular load is used.

For example, suppose that the system peak for the winter of 1940 were to be 500 or 515 thousand kilowatts. If we took 200,000 kilowatts off of that, that would leave us 315,000 kilowatts. Now we would examine this curve at the height of 315,000 from the bottom, and go horizontally over until we intersected the curve, and that would tell us how many hours that 315,000 kilowatts would have to be carried.

At the top of the curve we know that it is just one hour, and working out each step there, we can determine the num-

6409

ber of kilowatt-hours that it would take to cut 200,000 kilowatts off of our 1940 winter peak.

Then we analyze the storage of the reservoir and we find that the reservoir just has enough kilowatt hours to do that, including the rainfall that will be acquired, even on a minimum year.

All of these calculations have to be made in advance. They are corrected as fast as the actual figures are available, but we have to assume in these operations that each estimate ahead is based on a minimum year, and then correct it as quickly as the actual figures are available.

6410

By that process of cut and try, each day, and correcting a preliminary estimate and finally getting it pretty accurate,

—2,743—

we schedule the operation of both the hydro and steam plants in conjunction with each other, so that the hydro cuts this firm peak and at all other times, when it has excess water, we use it for kilowatt hours, and shut down our big units for overhaul during the period of flush water, and by that I mean during the spring months, about three months.

6411

It is possible to overhaul two of the largest units on the system during the period of the plentiful water power in the spring. At the present time we have occasion to only overhaul one, because we only have two of those units, and we alternate them, each one every other year.

If we were to acquire another large unit of equivalent size, or even slightly larger, there would be certain years in which we would want to overhaul two large units in the same year, and we could schedule both of them in that period.

During the valley of the load, after the summer peak is over, there is opportunity to overhaul one of our next largest units, such as the 50,000. By that method we operate with a satisfactory and safe reserve, and still try to keep the economy in mind at all times.

The hydro plants provide marvelous, quick-starting reserve, whereas, these large steam units require several hours to bring them up to load from cold, because we do not dare

—2,744—

6413 heat them up quickly.

So that at any time at which we were holding the reservoir full, and not using very many kilowatt hours, intending to cut this winter peak each day, we always have available this reservoir with a capacity of from 135,000 to 150,000 kilowatts for emergency.

So during that period, if we were to lose a large unit without notice, the hydro plant, particularly Osage, would pick up the load and carry it until such time as we could make other arrangements.

To that extent it provides a type of service that a steam

6414 plant cannot provide.

Q. Do navigation requirements enter into the method of operation of the Keokuk and Osage projects? A. The navigation requirements are very intimately connected with Keokuk operations. There is extensive navigation on the Mississippi River. There is no actual real navigation on the Osage River, and we are required to let through a certain amount of minimum stream flow, but it has very little effect on the operations of the plant. We probably would do almost that anyway.

Q. You might state what those requirements are, and what bearing they have on the operation of the plants? A. Well, the Keokuk plant has to avoid radical or rapid fluctuations of the river. We must not do anything at the plant

—2,745—

which will interfere with the boats.

For example, if a boat is tied up to a dock in the evening, and if we were to suddenly let through a large amount of water, trying to carry a little short-time peak, the river would rise appreciably, and the boat might be damaged. A 6416
boat would be affected really worse if we were already letting through a good deal of water, and were to shut it off. Then it might ground.

The result is that we have to operate with great care so that nothing will interfere with the river, and we are subject to the requirements of the War Department Engineers, who control river operations.

I may say that they are becoming a little more rigid in their requirements lately, which is brought about by the operation of this series of dams that have been constructed north of Keokuk to provide this navigation channel to Min- 6417
neapolis, and we haven't been able to tell yet just what effect that will have, numerically, but we think that those regulations will somewhat reduce our possible output at Keokuk, but it will not be serious.

Q. Now you have spoken of various estimates that have to be made of rainfall and the effect of weather conditions on storage capacity of the hydro-electric plants. Who makes these estimates? A. What individual?

—2,746—

Q. What department or individual? A. The hydraulic department. The individual is this same gentleman, Mr. Albion Davis, of whom I spoke previously with regard to his contributions to the art of turbine governing. Mr. Davis is the chief hydraulic engineer for the company, and was originally located at Keokuk for many years.

Q. Are these studies extensive and are they continuing? A. They are, they are quite involved. I attempted to explain only just the high spots here, and the simplest part of the
6419 calculations, and indicate the nature of the problem, but still you could not possibly go into all the details in a conversation or in any kind of testimony.

I have a few statistics here, one or two of which may have been given, but I would like to mention them for the system as a whole.

In 1939, the net generation was 2,468,395,631 kilowatt hours. The peak load was 476,000 kilowatts, but we have since attained a load of 489,000 kilowatts, on July 9, 1940. The load was increased from 476,000 to 489,000 in 7 months, or a little over 6 months. The increase in the use of kilowatt
6420 hours during the current year is greater than the increase in demand. Such studies as I have been able to make of this feature indicate to me that there are a number of industries

already operating on the night shift, as a part of the National Defense program. There is no other explanation for it.

We have examined all the factors that are available to us, and that is our conclusion.

Q. So that you are picking up load at off-peak times during the day? A. That is right. We made an analysis of our

minimums, rather than maximums; in other words, analyzed the highest night loads in the middle of the night, and we can see that those have come up appreciably, and although we don't have any specific knowledge of who these customers are, or just what is going on, I expect we could attribute quite a bit of that to possibly the shoe industry. The International Shoe Company has received a major contract already.

The coal burned during the year was 1,123,537 tons. That is a good many tons a day. At the same time, we must always 6422
keep in mind that in a normal year, normal hydro year, roughly speaking one-half of the kilowatt hours is generated by water power, and that has a major effect on the operation of our system, our steam system, and on the type of equipment that we can use; and you must always keep that point in mind in any comparison of the Union Electric Group with any property which is operated as a straight steam system.

The hydro operation has a very marked effect on the

system as a whole. Obviously, hydro kilowatt hours, having already acquired the plants, cost very little. In other words, 6423
the total annual operating expense of a hydro system is practically constant, year-in and year-out, and amounts to less than .2 mills; in other words, it is less than 1/10th of the production cost of a steam plant.

So that at any time we can get a large amount of water power, our total average cost of production per kilowatt hour goes down. The efficiency with which we produce it may go up. The totals go down, but the unit costs go up, so those things have to be taken into account.

6424

Colloquy

Mr. Hamilton: I think this represents a good breaking point, Mr. Examiner.

The Examiner: All right, we will recess until tomorrow morning at 10 o'clock.

(Whereupon, at 4:35 o'clock p. m., a recess was taken until 10 o'clock a. m., Thursday, October 24, 1940.)

—2,749—

6425

6426

6427

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

6428

Hearing Room 622,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Thursday, October 24, 1940.

Met, pursuant to adjournment, at 10 o'clock a.m.

Before: W. W. SWIFT, *Trial Examiner.*

6429

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD and HERMAN ODELL, Attorneys for the Securities and Exchange Commission.

—2,750—

6430 *Stanley Stokes—By Respondents—Direct*

PROCEEDINGS.

The Examiner: The hearing will come to order.

Mr. Hamilton: Mr. Stokes, will you resume the stand?

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

6431 *Direct Examination by Mr. Hamilton (Continued):*

Q. Mr. Stokes, you were describing the operations of the generating system. Will you continue with that statement? A. We have mentioned that the bulk of our steam power generation is produced on the Illinois side of the river at St. Louis. There is a very good reason for the location of the Cahokia steam generating station at that point. There is a difference in freight rates on coal which today amounts to 30 cents a ton, as between the West and the East side of the river. That difference has varied. It used to be 25 cents a ton for a good while, but in the last year or so, has been
6432 made 30 cents. That is known as a "bridge arbitrary". It is simply a difference in the freight rates from the coal fields to those two points. That makes it much cheaper and much more economical to produce the power on the east side of the river. The transmission of power under the river by submarine cables is more economical than hauling the coal across the river when consideration is given to the fact that we only have to transmit about half of it, half of it already being used

on the east side.

Coal in the St. Louis district and the Southern Illinois field has a low fusing point ash, and a relatively high sulphur content, which has necessitated much experimentation to avoid slagging of boilers. The bigger the furnace becomes, the higher the temperature of the gases leaving the furnace, if the pounds of coal per cubic foot of furnace volume are kept the same. That is more or less obvious, because in a large furnace the walls of the furnace do not represent as big a percentage of the volume as they would in a small
6434 furnace. That is to say, the cubical content varies as the cube of the lineal dimension, and the area of the wall goes up as the square of the lineal dimension, and you don't have as many square feet of cooling surface in the walls per cubic foot of volume of furnace as the furnace gets larger.

The result is that you reach the point, unless care is exercised, at which, with low fusing point ash, the tendency is for the ash to stick to the boiler tubes, to coat them, and that causes trouble.

There is also a tendency, if you try to crowd the furnaces too rapidly and burn too much coal per cubic foot of furnace
6435 volume, to cause the ashes to slag and become molten, and when that cools it is difficult to remove.

The result is that we have to give different treatment

to boiler design and operation in the Middle West than is done in the Eastern part of the country with different coal.

All of those things are learned by experience, and we are not obtaining very satisfactory operation, whereas, when Cahokia was first started, we had many difficulties in burning that coal successfully in the big units.

The circulating water for the condensers, which is taken from the Mississippi River—and incidentally, we pump every day several times what the City of St. Louis uses in their waterworks system, to cool the condensers—this water contains much suspended matter, particularly during flood periods when it would be full of fine silt as well as other things which would be too fine to be taken out by the screens, but which would still affect the condensers.

As a result of that we evaporate all of the make-up water
6437 which is added to the boilers, so that only distilled water is used in the plant. That, of course, avoids many other difficulties which would be involved if raw water were treated and used.

The situation over at the Ashley Street plant in that same connection is quite different because of the steam heating requirements there, where as much as 600,000 pounds an hour, under peak conditions, may leave the plant and not return. It goes out to the steam-heating customers, and they don't return it to us, so we have to make that up by very elaborate

6438 methods.

Now in the summertime we have rather unusually high water temperatures. This is conducive to the growth of algae, which is an animal growth and which forms on condenser tubes. We had to give careful study, through many years, as to the most practical and economical methods of combatting that difficulty. We chlorinate the water to inhibit the growth, and clean the condensers regularly and dry them out. The drying of the tubes by means of blowers very successfully kills the algae.

6439

Q. Will you state for us now the advantages to the Union Electric Group of having a combined hydro-electric and steam plant generating system? A. There are many advantages in a combined steam and hydro system. For example, it is known that the levees along the Mississippi River north of St. Louis, as now constructed, are probably not at all safe for the highest water recorded, which was 1884 high water. No such level has approximated this figure since, but there is no reason to believe but that at some day it can again be reached just as in the Ohio River Flood. We made quite 6440
a study of the levee situation, and decided that we would have to, in so far as possible, protect ourselves, and we spent about $300,000 on building a levee of our own around the plant property.

However, if the regular Mississippi River levees were to break anywhere above there, that whole area would be flooded in the East St. Louis district, and we would be

—2,754—

unable to get coal in to the plant for some time. We think that we can keep the water out of the plant. We have made very special provisions to bulkhead every opening, and the 6441
levees and walls, and other protective features are carried up above this 1884 high water elevation.

At the same time, the district itself would be unable to use power in any extensive amount for a considerable period, that is, the part that would be flooded contains a large amount of power-using industries. The result is that with our Keokuk and Osage plants, we would have no difficulty in supplying all the power that could be used during such an emergency, most of which would be used on the west side of the river.

So from that standpoint, we have a certain factor of safety which would be difficult to obtain in any other way.

As another point, in the tornado to which I referred previously, and which put out of commission our Venice plant for a period of two or three months, that tornado very narrowly missed a power plant—or a similar tornado, it wasn't the same one, but one which was just as destructive—barely missed a power plant to the south of us. It didn't belong to us, but it illustrated what could happen.

6443 And with this hydro power available, we feel very much more comfortable than we would if we didn't have it. Now we don't believe that a tornado would destroy the Cahokia

—2,755—

station so that it could not be rebuilt in a very reasonable length of time, but it would be possible for a tornado to tear down the stacks. Now after such conditions, with all of our interconnected facilities, we could continue operation without the thing becoming of calamitous proportions, while the stacks could be temporarily repaired.

6444 Without the reserve, I don't know just what we would do.

The next feature that I would like to mention is the fact that it was clearly demonstrated to us during the other World War, when coal became prohibitively expensive, and it was difficult to obtain cars to get it to the plant, the cars were all in priority service of some kind or other—and during that period, the Keokuk plant produced each year apparently its all-time high up to that point. In other words, we had very plentiful water power from Keokuk all during the period, and at the same cost, and no increase, at which it had already been supplied.

So that the water power, whose operating costs are constant and very small, has a certain stability. They do not vary with conditions. Let's take the present situation today. We may be going into a period of rapidly rising costs. Coal will increase in price, and coal represents a large percentage of our total production cost. Both hydro plants will continue to do the same as in the past, and we hope that we might be fortunate enough under those conditions to run

—2,756—

into several years of good water power, just as we have been 6446
through in the last four years. Now all those factors make the hydro-steam combination act like a balance wheel one to the other, and the combination has a number of features that are not at all apparent from a casual viewpoint.

There is a certain degree of stability there. If costs of equipment are to change rapidly, increase, the hydro plants require no change. The river flow is constant, and we never have to expand them, and they have such long life and very low fixed charges; it is necessary to go through the calculations in order to notice the difference in the annual fixed charges on a hydro plant, in a location where there is prac- 6447
tically no obsolescence, as compared with a steam plant where both depreciation and obsolescence are increased.

I might explain that obsolescence feature. Keokuk, which was installed in 1912 and started in operation in 1913, has had no occasion to change any switches or other devices because they were inadequate to handle the short-circuits or the currents. It is perfectly understandable, because the river itself is still producing the same amount of power and we aren't adding to it.

6448 *Stanley Stokes—By Respondents—Direct*

At Cahokia, or any of the city plants, the rapid addition of additional units, sections and features, cause the earlier equipment in many cases to become obsolete, and it has to be

—2,757—

removed before it is worn out.

The production costs of hydro-electric power are substantially a constant quantity, and amount to less than .2 mills per kilowatt hour. In other words, once you have bought a hydro plant and have it installed, the cost is very little to
6449 run it. And that cost is just the fixed charges for a certain fixed operating crew, transmission line maintenance, and other items, which, in comparison with the production costs of steam power, is almost negligible.

The main cost, of course, in the hydro plant is the investment part, that is, the fixed charges on the investment.

In examining the costs of our total plant output, we have to keep that in mind. For example, if steam generation is 30 per cent. of the total generation, then the unit cost of production for the system will be roughly 30 per cent. of the unit cost of the steam production. Likewise, if steam pro-
6450 duction were 60 per cent. of the total, then the unit system production cost would be roughly 60 per cent. of the unit cost of steam generation.

In other words, the amount that the hydro adds to the total cost is so little, that if you were to produce 50 per cent of the output by water power, and 50 per cent. by steam, your enumerator would simply be the total cost of steam production, the other would be negligible. In the denominator you would have twice as many kilowatt hours, so our total

—2,758—

system costs would be about half.

The hydro plants have been discussed as producing a reliable annual peak cut-off of 200,000 kilowatts as of today, with a possibility of extending this to 225,000 kilowatts by the time our load reaches 600,000 kilowatts.

I should like to mention that the highest all-time combined output of those two hydro plants has been 278,950 kilowatts. I mention that because I want to show that our 200,000 kilowatt figure which we put in these reports as dependable combined capacity of these plants, is materially less than their highest record. 6452

But it is as high a figure as we believe is conservative and can be depended upon through the winter peak.

During the high-water season, as we have previously pointed out, we take the base load of the system on the hydro plant, and oftentimes all of the units are operated, as referred to in the operating unit as "against the stop". In other words, if you can set a water wheel at its most efficient operating point, and lock it there, fix its governor so it won't change, and let the steam system do the governing, then you have the maximum efficiency in your hydro plant, and get the most out of the water. 6453

At these times we have customers, at Keokuk primarily, who can take power all the way from nothing up to 30,000 kilowatts. These are known as dump power customers, and the sale of this power we refer to as excess power. It is sold

to these customers, people like du Pont and others, who make a product such as 50 per cent. ferro-silicate, which can be stored and can be held profitably until the market requires its sale, and they take advantage of the low cost at which we can sell this type of product, to produce the ferro-silicate.

We are not required to guarantee the delivery of that power, and it therefore acts just like a reserve plant as far as we are concerned. We can discontinue it at will, or upon relatively short notice.

So that that feature is an interesting part of the operation of a hydro plant, that there is a good deal of water power which is not continuously available and for which you do not care to make a continuous investment, but which returns both to the consumer and to ourselves a very nice
6455 and profitable return. The customer return is in terms of very low cost power, and ours is because we do not have to charge against that type of power any fixed charges.

There is another class of service which has somewhat those same characteristics, in which we have sold a very limited amount, known as what we call our 60-cycle reserve service. That is not an important item, about 5,000 kilowatts of it; and it is the type of load where the customer can either discontinue for a while, or has another source of

supply, and on moderate notice we can discontinue his load
6456 in the event we need the capacity for our regular firm customers.

The frequency changers which have been referred to previously as being very economical and saving considerable water power, actually used or converted 100 million kilowatt hours a year for over five years during the depression, which would otherwise have been unusable and would have been wasted. That was the basis of the statement which I made, that they had saved roughly $2,000,000. I believe that valuates this energy at about 4 mills.

During the low water season, we utilize the hydro generation in combination with the steam to reduce the steam plant operating costs. This is without reference to the detail of how we do it, we fit it in carefully at the place where it will produce the greatest economy.

The spinning reserve benefits in quick starting were mentioned with respect to Osage previously. That is to say, we pointed out the fact that you can pick up load in less than three minutes. We did not mention, however, that the use of this spinning reserve costs about half what it does to keep 6458
a steam turbine in reserve. It is economical to that extent, that it will not only start quicker, but it actually is very much cheaper to handle than the turbine, when carried for reserve operation. You cannot run a steam turbine at zero

—2,761—

load, you have got to have a little load on it, and that means that you are generating kilowatt hours at lower efficiency under those conditions.

Q. Now where is control of the generating system centralized? A. Control of the plants which have been described, and all of the lines and so on, for the Union Electric Group, 6459
is centralized in a system load dispatcher, and his group of system operators. The whole system is handled exactly as it would be if it were just one company, and the system operator or chief load dispatcher has full authority to see that the plants are operated in accordance with his instructions, and also his operators handle the switching of lines when it becomes necessary.

Q. Where is the chief load dispatcher located? A. He is located in our 12th Street Office Building. We have a

large downtown office building in which the top floor is given over largely to the load dispatching facilities. We have rather expensive control boards, and elaborate facilities for communication. We have what are known as Selsyn equipment. That is an interesting type of control in which the position of any kind of a rotating device at one location can be transferred to another. It isn't practical to transfer metered circuits several miles, as there would be losses, and there would be lots of reasons why you couldn't do it. But

6461 —2,762—

we can transfer the position of a meter hand at Cahokia to the same position on a board at 12th Street, by what is known as the Selsyn control.

It is a relatively simple device. If you take a three-phase motor and supply the fields from a common source, and these two motors are located at remote points, you can arrange those so that they will take the same position exactly. If one is moved half-way around, the other moves with it. These motors do not rotate continuously, but they are designed and built just like a motor, and if we turn this one, the other

6462 will turn exactly with it. If this is regarded as a master control, I can have as many as I want of these others at different locations, and each will take the same position.

So that if that little device is attached to a hand at Cahokia, and is made to follow the meters over there, with the meter scale and a device that looks like a meter over at the 12th Street office, the operator can read exactly the same thing.

If the meter at Cahokia were to say 100,000 kilowatts, this one at 12th Street reads 100,000, and the load dispatcher can tell what the loads are at some of the key points.

That is only one of the features. We have, of course, the customary board with its mimic buses, and little lights, and relays, and all other things that go with an indicating system so that the load dispatcher and his operators can have

—2,763—

full information at all times as to what position all major switches on the system are in; also as to what turbines are on load, and approximately the loads handled by those; and exactly the loads taken by the plant as a whole.

We do not remove from the manager of the Cahokia plant 6464
the responsibility for keeping his stuff in regular operation, and the load dispatcher in a system of this type does not attempt to take over the detailed operation of a plant. In fact, the less he knows about it, the better off he is, because the man best equipped to take the responsibility for the thing is the man at the plant. All the load dispatcher needs to know is information which is essential to coordinating system operations. In general, the load dispatcher is really a man who schedules and predetermines the plants, wheels, and other apparatus which is to be used a few hours or a day later, and the system operators are those who carry out 6465
the detail operating.

The hydraulic engineer, for example, gets forecasts of the rain in the reservoir, the rainfall, and we have weather report stations up the river, and we have telephone communication with those stations. We have men available to check all of the hydrographic features, and all that information is accumulated in the central office, and with the calculations to which I have previously referred, this hydraulic engineer gives to the system load dispatcher the basic information as

—2,764—

6466 to what the hydro conditions are expected to be the next day, for example.

With that, the load dispatcher determines the loads that he will have to carry on his steam plants. In addition to that, we subscribed to an experimental form of weather service to try to even amplify the amount of information available as to the weather. I don't believe that that in itself was so very successful, we didn't think it would be, but we didn't want to overlook any opportunities. But it did stimu-

6467 late the Weather Bureau itself, who I believe didn't particularly enjoy private groups going into the weather forecasting business, and they set up a four-day forecast, four or five days ahead.

We have been getting it, on the regular weather maps, about one day ahead, but they forecast the thing four days ahead continuously, and they have only been doing this about four or five months, and so far they have been marvelously perfect. They have done better than the private service, and if they continue to be as good as they are now, it will be of great help to us.

6468 So that the load dispatching is primarily one of knowing what the hydro plants are going to do, scheduling them in combination with the system, setting up the requirements for each machine on the system, so that the ultimate end is the most economical over-all combination that we can produce, and conditions change from day to day, and it re-

—2,765—

quires continuous attention. You can't set it up and go away and let it alone.

The other predictions, which I should say are a part of this thing, are the load predictions. That is, I have referred

to the other predictions, and I should also mention that it is also necessary to predict the load itself, what we are trying to handle.

We occasionally get upset on some of those predictions because of an extremely dark day, due to smoke or fog that was not contemplated, and which will increase the load. But in general, from previous experience we know that if the load was so-and-so last Tuesday, that next Tuesday it will be similar; although Wednesday it will be different; and from our knowledge of the characteristics of the load 6470 each day, they are able to set this thing up with surprising accuracy.

The load dispatcher predicts these things, I think, with more or less uncanny accuracy. That is just a matter of years of experience.

Q. How is the flow of reactive power controlled in the system? A. In order to answer that question, I should make as simple an explanation as I can of what is meant by reactive power. Briefly stated, when a motor which is driving a mechanical load is supplied over a transmission line from a power plant, it has to receive two components of power, 6471

—2,766—

one what we call the kilowatt component, which provides the mechanical force to drive the motor and do the work; the other, the reactive or kilovar component, which provides the magnetizing power to provide that all of the magnetic circuits of the equipment are properly excited or energized.

This reactive power has a more definite effect on voltage drop around the system over apparatus through transformers than the kilowatt load itself. The kilowatt com-

6472 *Stanley Stokes—By Respondents—Direct*

ponent is affected largely by merely the resistance of the circuit, whereas the reactive component is affected by the inductance of the circuit.

In the early days of plant operation, little attention was paid to reactive power. No metering equipment was provided, and all we talked about were kilowatts. Today we have produced a means of metering the reactive power in a manner equally accurate with that of the kilowatt power. We have our kilowatt meters and our reactive meters,
6473 separate instruments.

This measuring of reactive power in itself is not new, it has been done for years, but the problem always seemed to arise, when one plant operator was trying to get another plant operator to pick up reactive, as he would say, ask him to take more of the reactive load on his plant, change the excitation of his machines, for example, in order to control the voltage, you do raise the voltage at one point and lower

—2,767—

it at the other, by simply shifting the flow of reactive power between the two plants.

6474 In attempting to do that, there always seemed to be a misunderstanding as to what direction of flow we were talking about. The thing is purely arbitrary and we have, as a result of analyzing the definitions and setting up some arbitrary directions, and by changing directions of about 25 per cent. of the reactive meters on the system, we have, a few years ago, a standard direction of reactive flow, and there is no longer any question in the minds of the operators what they are talking about, and we carry out the dispatching of reactive power just exactly the same as we do the

kilowatt power, and to that extent I think we are somewhat original in this method.

We have found it to be extremely important, and we have the facilities to do it, we put them in. By that I mean, if you did not have load ratio control transformers, whose transformation ratio can be varied while they are operating under load, you couldn't do very much about it anyway. All you could do would be to vary the excitation of the fields of your generators.

On our system, all of the major points are equipped with 6476
these devices, and in addition we have condensers operating at Page Avenue sub-station, Rivermines sub-station, we have the corrective capacity of the generators in each of the steam

plants, and with those facilities we are able to maintain satisfactory voltage and not have an excessive flow of amperes, which is just wasting energy and making losses throughout the system. And it is a real pleasure to see the thing work if you have put in so many years gradually approaching this goal.

The recently installed generators are all provided with at 6477
least a k. v. a. capacity in which we can handle .8 power factor loads, without overloading the generator; in other words, they are rated as .8 power factor generators.

The voltage control which I speak of was largely directed towards the transfer of power and reactive k. v. a. between plants. In addition to this, of course, any system operating long transmission lines—and we have a number—requires that the lines themselves be controlled with synchronous condensers. There is nothing novel in this at all, and I make no

6478 claims for anything original on that, but the facts are that we do it, and do a good job of it, and we did one thing which was somewhat original, and that was the combining, in those frequency changers at Page Avenue, of the capacity to permit them to act as large condensers, and by that simple means we saved the operation of a complete duplicate set of machines, because those were going to run all the time anyway.

6479 We have to dispatch the handling of those condensers with great care, because, although they are automatic in operation, the position of the automatic equipment is under manual adjustment, and the stability limits of these trans-

—2,769—

mission circuits are affected very quickly by the method of operating these condensers. So that the operators of a system of this type are not only skilled men, but they have to be of rather high type electrical men; they have to have considerable electrical knowledge. Practically all of our men of that type are largely—I think I am safe in saying a large percentage are—university graduates. All the men we hire

6480 today, who are intended to be graduated into that class of work, are university graduates.

The combination benefits to be derived from a hydro-steam system have great possibilities, but in order to obtain those benefits, extreme care has to be exercised. We feel that we are getting as much out of those plants as we possibly can, and it takes continuous application to do it.

Q. How is frequency controlled on the system? A. Frequency is controlled on our system by manual adjustment of the main turbines at a very gradual rate. We never allow

the frequency to vary more than plus or minus 1/10th of a cycle. That is exclusive of some possible sudden short-circuit, or something which, for a few seconds, might pull it down; but normal frequency is controlled within plus or minus 1/10th of a cycle, or plus or minus .05 cycles for the 25-cycle system, the 1/10th cycle representing the 60-cycle system.

If there are 60 cycles a second, 1/10th of a cycle would

be 1/10th of 1/60th of a second. We use Arlington time signals, which are dispatched to the plants by the telephone 6482
system three times daily. The maximum total accumulated time deviation, which, as far as I know, never occurs on the system, but which we agreed could occur without damage, will be plus or minus 3 seconds, and the regulating stations initiate corrections and try to maintain the time accurately within plus or minus one second. That is, there is never any accumulated error, that is the maximum amount by which the system might vary ahead for a little while, and then vary back, but on the average it is corrected and maintained absolutely correct at least three times a day.

The application of automatic time control equipment pro- 6483
duces a chart which is very little different from the one that we have. We could install the equipment at any time we want to, and have considered doing so, but the necessity for it did not appear to arise. We were not able to economize any on operators, because they had to be there for other reasons. And unless we have a closer requirement for time than now exists, we see no particular reason to install what is known as the automatic controller. That, however, can be installed at any time, and the turbines and all of the equipment are arranged to receive it.

6484 *Stanley Stokes—By Respondents—Direct*

Q. How is spinning reserve distributed over the system? A. We maintain spinning reserve, that is, turbines actually

—2,771—

operating and connected to the system, equal to our largest unit, which is 75,000 kilowatts. This has been previously mentioned.

The answer to your question is that we distribute this spinning reserve over the different parts of the system in such a way that failure of connecting links will not cause
6485 any loss of load due to lack of reserve. That is, there are essentially on our system what we call the north part and the south part, and if we were to put all of our reserve on the south part of the system, and then operate circuits in such a manner, as is occasionally done, and which becomes necessary at times, that this reserve would not be able to be placed on the north end of the system, in the event of transmission line trouble between the two parts, we would then place some spinning reserve on the north half of the system, even at an increased operating expense.

Of course, it is always cheaper to maintain your spinning
6486 reserve in one large unit at your big plant, but it will not always take care of the requirements of reliability of service, and we sacrifice, under those conditions, economy in operation to reliability, and split the reserve up and place it where it will do the most good.

In this combination of spinning reserve is where we make the most beneficial use of the Osage plant. If we had to

—2,772—

or at Ashley Street, and run it hour after hour, it would be place a small steam turbine on north half of our system,

much more expensive than spinning one of the wheels at Osage.

Q. What has been the record of the Union Electric Group with respect to reduction in operating expenses per kilowatt hour? A. The operating expenses in what there was of the Union Electric Group in 1902, were over 3 cents a kilowatt hour. As a result of the advances in the art, through economies resulting from consolidation and unification of a number of operating companies, operating expenses have been reduced to approximately 5 mills per kilowatt hour 6488 sold. These figures do not include taxes or depreciation.

The variation in these operating expenses is affected by water power, as has been previously referred to.

Mr. Hamilton: I will ask the reporter to please mark this sheet as Respondents' Exhibit No. 53 for identification.

(Respondents' Exhibit No. 53 was marked for identification.)

By Mr. Hamilton: 6489

Q. Will you state what this exhibit represents? A. This Exhibit No. 53 for identification represents the net output of energy of the Union Electric Group in millions of kilowatt hours, by years, from 1926 to 1939, inclusive. In addition thereto, it gives the operating revenue in cents per kilowatt hour sold, the production expense in cents per kilowatt hour

sold, and the total operating expense in cents per kilowatt hour sold, for the same period.

6490 *Stanley Stokes—By Respondents—Direct*

Q. This table has been prepared under your supervision? A. It has.

Q. And the facts shown are taken from the records of the respective companies indicated? A. They are.

Mr. Hamilton: I offer this in evidence as Respondents' Exhibit No. 53.

Mr. Odell: No objection.

The Examiner: Let it come in under that number.

6491 (Respondents' Exhibit No. 53 was received in evidence.)

Mr. Hamilton: I call attention to the fact that the exhibit indicates an increase in net output from 1,326,830,000 in 1926, to a figure of 2,468,420,000 in 1939; and that it shows during the period indicated a decline in operating revenue per k. w. h., a decline in production expense per k. w. h., and a decline in operating expense per k. w. h.

I will ask the reporter to please mark this sheet for identification as Respondents' Exhibit No. 54.

6492 (Respondents' Exhibit No. 54 was marked for identification.)

By Mr. Hamilton:

—2,774—

Q. Mr. Stokes, will you state what this chart, Respondents' Exhibit No. 54 for identification, represents? A. This represents the b. t. u. per switchboard kilowatt hour, for the Cahokia steam generating station, for the years 1924 to 1939.

6493

Q. Has this chart been prepared under your supervision? A. It has.

Q. And the facts shown are taken from the records of the respective companies indicated? A. They are.

Mr. Hamilton: I offer this in evidence as Respondents' Exhibit No. 54.

Mr. Odell: I have one question before that is admitted.

I would like to have the witness explain what this phrase, "per switchboard kilowatt hour" means, as it appears on this chart?

6494

The Witness: That is a net switchboard kilowatt hour, I believe—if I find that to be in error, I will make the correction promptly.

Mr. Odell: You mean that there is some question in your mind as to whether that is net or gross?

The Witness: There is, because that wording there, which I had not previously observed until I read it here, the heading of the sheet, is indefinite, and I have given the statistics in the record for output figures. For example, in this exhibit here, 53, those figures

6495

—2,775—

are net kilowatt hours. I have also previously given some figures on total gross kilowatt hours, and although this was prepared under my direction, I did not do the exact work, and I am not quite certain whether that is gross or net.

Mr. Hamilton: Will you verify that, Mr. Stokes, and let us know?

The Witness: Yes.

6496 Mr. Odell: I suggest that we withhold the receipt of this exhibit until that is clarified.

The Examiner: Subject to supplying that information the chart is received as Respondents' Exhibit 54.

(Respondents' Exhibit 54 was received in evidence.)

By Mr. Hamilton:

6497 Q. I note from the chart, Mr. Stokes, certain variations or fluctuations over the period shown. Will you indicate briefly the reasons accounting for those fluctuations? A. They are brought about by the variations in hydro output, as previously mentioned. The year 1935, which has varied upward, was the result of extremely good hydro conditions, and the operation on the steam plant was at a very low rate, and we had difficulty in maintaining load enough to get up to the efficient point on the units. In 1935, as you recall, was in the depression, just coming out of it, and the combination

—2,776—

6498 of a good hydro year, with the low level of load, caused inefficient operation on the steam plant, but low total costs. Whenever you see a condition like this, with high b. t. u. per k. w. h., or relatively low steam plant economy, you will find a correspondingly lower total annual production cost, because it merely means that a large number of hydro kilowatt hours have come in there with hardly any expense.

Now if you took the year 1937, the first six months of 1937, the hydro power was very good. The average Cahokia load was only about 50 million kilowatt hours, causing poor

fuel economy at that time due to the fact that the hydro power was good. Have in mind that I am talking about efficiency of the operation of the turbine, and not total system cost of production.

This was followed by six months in which the hydro power had declined suddenly, and did cause a record high output from Cahokia. This put the operation of all the equipment at a point close to its capacity rating, and was above its efficient point, which would be about three-quarters rating, or a little above that. So that again caused a loss 6500
in economy.

In 1936, which was between the two, that was one of the poorest hydro years we have had, and that showed the effect on the steam plant by improving their economy.

—2,777—

In 1938, the improvement in economy there was the installation of the No. 6 turbine, a 75,000 kw. unit, which went into service at the end of 1937. At the same time, there was a marked recession in loads which began on August 13, 1937, and we suddenly dropped load rapidly, and that left Cahokia's output rather light, toward the end 6501
of the year. This, together with good hydro conditions again in April, May and June, resulted in a rather low annual output for the year, but the installation of the turbine caused a drop in the following year.

In the year 1939, you will notice that it has dropped down, and that is brought about by the new turbine itself being more efficient than the other units except No. 1, which is about the same.

Q. In order to make the curve clear, will you state whether the point shown for 1924, for example, is an average

6502 *Stanley Stokes—By Respondents—Direct*

for the year, or whether it has any other basis? In other words, does this represent average B. t. u. for 1924, 1925, and so on? A. Oh, yes, it represents the average for the full year.

Q. And will you state the specific figure for 1924? A. 17,600 B. t. u.

Q. And, similarly, the figure for 1939? A. The figure for 1939 is 15,840, as close as I can read the B. t. u.

—2,778—

6503 Q. Are you able to draw a comparison between the figures represented by this exhibit and the B. t. u. consumption for your Ashley Street plant at a period much prior to that shown by the exhibit? A. Ashley Street, in 1904, used 48,000 B. t. u. per k. w. h., and up as late as 1916, used 38,000.

Q. Has the cost of fuel shown a tendency to increase over the period of years? A. Yes, fuel is affected by both the labor costs at the mines, and freight rates, and our fuel costs have increased about 63 per cent. in the last 40 years.

Q. You might indicate, if you will, the general nature of that increase over the period you mentioned? A. Well, from
6504 1902 to 1918, the fuel cost about 6 cents per million B. t. u. From 1917 to 1927, the cost ranged from 13 to 20 cents per million B. t. u. Since 1928, or rather, 1929, we have purchased coal from 10.4 cents to about 12 cents per million B. t. u. Our anticipated, calculated cost for 1941 is roughly about 11.74 cents delivered to the plant, or 11.82 delivered in the bin. Those prices are calculated to take into account the effect of this Guffey bill.

The increase in the economy of operation has kept up with the increase in fuel cost to give a total lower cost of pro-

6505

duction. If the fuel cost keeps on increasing, though, there

—2,779—

will come a time when we can no longer keep up with it, because we are beginning to approach a theoretical efficiency of our steam plant cycle.

I would like to expand just a little bit on that point. The hydro plants produce in a normal year about half of the total power, and make it more economical to operate a medium priced, medium efficiency plant, than it would if we did not have the hydro plants. For example, we have provided at Cahokia facilities to put in economizers in the first two or three sections. We never were able to show that the installation of those economizers would be an economy; in other words, that the gain in the B. t. u. economy or performance of the station would be more than offset by the maintenance and fixed charges on the economizers themselves.

6506

Keep in mind that our coal cost is not high, relatively. You may get 16 cents per million B. t. u. in the Eastern States.

6507

So that in the later sections we installed air preheaters, we do not use economizers.

In our Venice plant now under construction, we studied all of the various steam cycles to find out which one appeared to have the most merit, and we selected the 850-pound, 900-degree cycle as previously mentioned, which should give an economy of much less than Cahokia. But at the present time, we could not justify, or we could not show any gain in economy—and by "justify" I mean could not prove to ourselves,

in making a comparative calculation, could not show any

—2,780—

gain in economy by going to a slightly more efficient cycle of 1,250 pounds, 925 degrees. We would really lose money, the overall cost being greater.

Another thing, if we were to install 160,000 kilowatts of this new equipment at Venice, at the present time and with present loads, instead of the 80,000—I am talking about today, now, to bring them in for operation in the winter of
6509 1941—we would be unable to give the additional 80,000 kilowatts a high enough load factor, we couldn't use it long enough hours of the year to produce an overall cost as cheap as we get in Cahokia. We would have to wait several years before our load would be sufficient that we could do it.

Our present system load at the night time is about 250,000 kilowatts, and there are times when we, for very short periods, have that amount of hydro power alone. So I merely repeat at this point the statement made once before, that all of these figures have to be given careful consideration in the light of the method of operation in connection with the
6510 hydro plant. If we were a straight steam system, we wouldn't operate just as we do.

Q. What department or departments operate and maintain the main and subtransmission stations of the Union Electric Group? A. The operation and maintenance of the electrical equipment in the generating plants and sub-sta-

—2,781—

tions on the main and subtransmission systems, is the duty of what is known as the electrical department. The electrical department has two rather main subdivisions, the power

plants department and the sub-station department, but it is their job to maintain and operate the property under this supervision, and to a certain degree they do construction work. That is, we do our own construction work on all ordinary types of jobs, and about the only time that we ever have done any extensive contract work has been in connection with the installation of a main steam plant or hydro plant.

Q. I think it would be interesting, as part of this description, if you would state the distribution of the demand over the system at the time of a recent peak demand on the sys- 6512
tem. A. We had a recent peak demand, referred to in previous testimony, of 489,000 kilowatts. But on another day in the same month, in a recent month, about July, we analyzed a peak of 484,000 kilowatts, just selected one at random, and made an analysis to see how the load was divided.

These figures that I propose to give you are kilowatts and not kilowatt hours. I am trying to illustrate the division of load where it occurs on the system.

At the time of that system peak of 484,000 kilowatts, we had on the 25-cycle system at Keokuk, in that vicinity, 6513

—2,782—

66,600 kilowatts. There was no 60-cycle load in that vicinity at that time, so the total peak at that location was as given.

At Hull, which has been located on the map, and with which we are familiar, we had 16,600 kilowatts, all 25-cycle load.

At East St. Louis, we had 6,200 kilowatts, 25-cycle load, and 94,600 kilowatts of 60-cycle load, totaling 100,800 kilowatts.

St. Louis itself had 43,000 kilowatts of 25-cycle load; 184,700 kilowatts of 60-cycle load—or a total combined of 227,700 kilowatts.

Rivermines, Missouri, had no 25-cycle load, and a peak of 37,100 kilowatts, 60-cycle, which is also the total for that district.

I made reference to the St. Joseph Lead Company load as running between 28,000 and 30,000 kilowatts. With a peak of that character, I should say that their load would have
6515 been about 30,000 kilowatts, and our distribution load in the vicinity of 7,000 or 7,500, in that range.

In order to equal the exact peak figures, we have calculated the losses in some parts of the system, and in other parts they are actually measured, with the result that the losses are estimated to be 4,600 kilowatts on the 25-cycle system, making the combined total peak 137,000. The losses on the 60-cycle are calculated at 30,600 kilowatts. This fig-

—2,783—

ure is a combination of measurement and calculation. The combined losses total 35,200 kilowatts, giving a system total
6516 of 484,000, as stated.

The Examiner: We will take a short recess.

(Whereupon, a short recess was taken, after which the hearing was resumed.)

The Examiner: Let us resume.

By Mr. Hamilton:

Q. Is control of the electrical system also centralized in the load dispatcher? A. It is. Control of the generating plants and the flow of energy over the system is centralized

in the office of the load dispatcher, located at 315 North 12th Street, St. Louis.

The Mississippi River Power Company and the Union Electric Company of Illinois, both have load dispatchers who control the switching on their own system under the direction of the St. Louis dispatcher. That is, it is not good business these days to bring too much detailed information into the hands of one man who can not possibly take care of it quickly in an emergency. You must not rob the responsibility of your individual operators; at the same time you 6518
must retain rigid control and supervision over them by the central dispatcher. That is the basis of their operation.

When I say that these separate companies have their own

dispatchers, those dispatchers have a limited scope of operation within their own district, and the general operations are under the control of the main dispatcher. Each man knows just where his responsibility stops, and the other man picks up.

As these systems grew, that was one of the first features 6519
that we had to watch. We over-centralized a little bit, and began to overload the duties of our central dispatcher. Then we had to reanalyze the problem, and today we have authority, for example, in the Cahokia superintendent or manager, to handle the machines under his own supervision. The load dispatcher is automatically notified of what they are doing, and in an emergency the load dispatcher handles the system, and the individual plant operator handles the plant.

6520 At other times, when there is no immediate emergency, the load dispatcher has already scheduled the operation of the units.

Of course, one of the important features in all load dispatching operations is adequate communications of all kinds, and the load dispatcher's office is in direct telephone communication with all generating plants, and in addition he has a carrier current telephone, which gives him an auxiliary means of reaching Osage, Rivermines and Keokuk

6521 in case direct telephone communication is not possible.

I mean by that, that there may have been some storm which has interfered with the telephone lines. Our power —2,785— lines are constructed much more reliably than any telephone circuit can be, and under sleet or storm conditions, the carrier current would still be available.

The load dispatcher's board is arranged with direct wire, lamp indication of the position of the generators and main bus oil circuit breakers at Cahokia and Page Avenue sub-station.

6522 All direct current automatic stations and four of the automatic A. C. sub-stations also have lamp indicators showing what machines are on the system. That, although it sounds like a good ~~many~~, is a very brief group of indications as compared to what could be done.

All generators at Cahokia, Venice, Ashley, Rivermines and Osage are started, loaded, regulated and shut down in accordance with the dispatcher's orders and schedules.

The dispatcher notifies the Keokuk plant of the load which they are to carry for St. Louis, but the dispatcher in St. Louis does not attempt to specify which or how many of

the 15 units at Keokuk shall be used, that being left to the chief engineer at Keokuk. The dispatcher also has control of and directs the operation of all transmission oil circuit breakers of 6,600 volts and above, as well as the buses of all sub-stations in so far as their primary supply is concerned. When I say "dispatcher", I refer to him and his group. He has assistants.

—2,786—

All feeders involving direct distribution of energy to customers are under the control of the trouble department, 6524
whether they are at 13,800 or 33,000 volts. Where a feeder serves a dual purpose of transmission and distribution, the load dispatcher and the trouble department cooperate.

To handle the telephone traffic in the load dispatcher's office, each of two load dispatchers have desk-type switchboards with one trunk line direct to the outside, and three trunk connections with the automatic private branch exchange in the building. The carrier current telephone and direct wires to all plants and important A. C. sub-stations as well as the D. C. sub-stations, are brought in on each desk. Either man can pick up the call from the other, the stuff is 6525
all duplicated.

The combination of Bell Telephone service and our own private wire service is completely unified; that is, we have finally succeeded, after many years, in making extremely satisfactory arrangements whereby our own equipment can be brought in, in conjunction with the Bell Telephone equipment, and you don't distinguish when you are on the dispatcher's board. There were many years when the Bell Telephone Company thought that anybody else's telephone system would be dangerous if connected with theirs, but they

have gotten over that viewpoint, and we have a very fine arrangement which is superior to anything that either one of us could do alone.

—2,787—

For example, in the old days we used to have to go to some other room or phone if we wanted to use our carrier current, or we might have to call a man and have him repeat the message. Today we can operate through the regular board facilities, you wouldn't know the difference, hardly.
6527 You can tell the difference in the quality of the tone a little bit, but otherwise you would hardly know whether you were talking on the carrier or on the Bell wire.

Q. Are the control boards in each power plant continuously manned? A. Yes, in each power station we have a complete control board. For example, at our main plant at Cahokia, there are five men on duty in the control room continuously. These men are assigned as bench board operator, auxiliary board operator, floor man, and maintenance man. The main operator, in ordering—or in operating a switch himself, has a floor man always available to him, where he
6528 can speak to him, whom he can send out and inspect the switch before or after opening, any way he wants to, or if he is opening a switch to put a "hold-off" tag on it for men to go to work, he sends this floor man out and has him open the disconnecting switches and place the tag out there, while the operator places a tag on the control button, so that nobody can close that switch while a man is at work.

The board operators attend to the control of the machines

—2,788—

in the plant, take readings on the meters every 30 minutes, and attend to any switching required by the load dispatcher.

I have made it clear, have I not, that this board I am now speaking about is over in the power plant? I am just taking a typical board.

The maintenance man, whom I didn't mention, or whose function I didn't mention, checks the controls, the rewiring and the operating conditions of the breakers in addition to the ordinary steady maintenance work as carried on by a different crew altogether. This maintenance man is regarded as an operating man and it is up to him to see that certain of these equipments that are under the direction of the bench 6530
board operator, are examined at regular intervals, in addition to the usual scheduled maintenance work.

Q. How many of your sub-stations are manually operated? A. There are 89 sub-stations on the system, 29 of which are manually operated continuously with one or more operators on duty. Sub-stations, in some cases, are both manually and automatically operated, as is the case where old equipment is still in operation, and automatic equipment has been added.

The division of these various stations by classes may be stated as main transmission sub-stations, manually operated 6531
—and there are 12 of those. There is no economy in attempting to operate a main transmission sub-station automatically, although there is an improvement in the reliability and con-

—2,789—

tinuity of service by having a large part of the equipment in these main stations automatic equipment. That is, the man is required there for communication purposes and for many other purposes, and we have found where we have added automatic equipment to old stations, that the auto-

matic equipment can do things that a man can not do, but there is one thing that the automatic equipment can not do, it does not think. It will carry out any predetermined schedule of operations, probably better and certainly quicker than a man can do it, but if the predetermined schedule of operations is not the thing to do at that particular time, the automatic equipment will probably do it anyhow, if it can.

For example, if you want to provide all the features in an automatic station that should be used, and provide a
6533 schedule of what should take place, in the event of a fire, you are very likely to lay down the wrong rules, that is, you have got to assume where the fire is going to start, and a lot of things like that. A man in the station would do something else. So that in these major stations, you have to have so much communication, so much transfer of information, so many other things to do besides operate electrical equipment, that we are not replacing the men with the automatic equipment, but we do add from time to time automatic features, and that is going to be continued more and more in the future, and we finally take advantage of a man's
6534 brains and do not tie him up with a lot of miscellaneous routine work which automatic equipment could do just as well.

We have 14 manual distribution stations, 49 automatic distribution stations, 3 manual direct current stations, and 6 automatic direct current stations,—in addition to those I previously mentioned.

Q. I don't think you mentioned the automatic main transmission sub-stations? A. The five?

Q. I don't think you mentioned that number. A. Main transmission sub-stations, automatic—5.

 6535

There are grades of main transmission stations, that is, some of them are larger and more important than others. Those are where we have the operators. There are some cases where a sub-station is on the main transmission system. The one that I recited in some detail particularly, the Franklin County sub-station, that is attached to a main transmission line and called a main transmision sub-station, but it is automatic. The type of station I am referring to in this discussion was such as Page Avenue, for example.

Q. How is plant and sub-station equipment maintained 6536
in the Group? A. Each power plant has a machine shop and a force of maintenance men who overhaul all of the rotating and stationary equipment, and even when a major steam turbine requires overhaul, the work is done by our men

under the supervision of a manufacturer's representative. If we are going to take down a large turbine, we always want a manufacturer's representative on the job to see what the condition of the machine is when it is removed from service and opened up. That is largely a matter of division and the proper placing of responsibility. 6537

In addition to those power plant repair shops, I mentioned in the previous testimony that we had one main machine shop which is complete; and where a motor or device of any kind needs overhauling or rebuilding, and if it is so it can be moved, it is sent over to our main repair shop, keeping the amount of work carried on at the power plants at a minimum, the amount of machine work, I mean.

At the sub-stations, the maintenance and repair work is done under the direction of the sub-station department, who

6538 *Stanley Stokes—By Respondents—Direct*

have regular crews engaged in this work the year around. Again, if there is any special work to be done on the substation equipment, and if the equipment can be moved, it will be taken over to where our utility repair shop is located, for welding or forging, or such things as milling machine work and things like that.

The utility shop rebuilds distribution transformers. That is one of their main duties. There are thousands of those transformers in service, and they have to be continuously

6539 —2,792—

repaired and rebuilt. We used to rewind all of our distribution transformer cores ourselves, but within the last year or so, we have largely adopted the practice of buying replacement cores direct from the manufacturer. We take the old transformer down, bring it into the shop, take the core out of the tank, clean the tank up, and sandblast it, and repaint it or re-enamel it, and put in a new core, new oil, and it goes back in service in all respects a new transformer. The reason for this change is not that we can not do just as good a job on these cores as the manufacturer—we have the facilities

6540 and do—but it is that the gradual change in labor costs, and increase in quantity production methods in the factories, have made it cheaper to buy the replacement core.

There are lots of other types of work, such as impregnating, baking, cleaning, spray-painting, transformer testing, and similar work, which is done at this utility shop.

Flow painting is a new development being applied the first time this year to paint radiators on transformers. They are relatively inaccessible to a paint brush, and it is very difficult to get them properly painted, and we simply set the

6541

whole transformer in a big tank, lifting it into a big tank by a crane, and flow the paint right down over it, and it gets into every little crevice. We think we will not have to paint them one-third as often, by using this method, as we used to have to when we sprayed them on or tried to paint them

—2,793—

with a brush.

The sub-stations each require a local battery. That has nothing to do with the main storage battery that I referred to as having been eliminated in the Edison system. They require batteries for operating the oil switches, and those batteries are maintained by a crew of four men in the Electric Company of Missouri, the St. Louis district only. The Electric Company of Missouri is the company which has the subsidiaries, but it is also an operating company, and I am referring to it now as an operating company in the city district.

6542

It has this crew of men who continuously inspect these batteries, and keep them up on a schedule that requires an inspection of each battery every two weeks.

6543

In a similar manner, we have crews in the other sections of the Union Electric Group.

Each power transformer on the system is checked every six months as to breakdown and condition of the oil. If sludge is forming, or the dielectric value of the oil is low, filtering is required. Otherwise, complete filtering is resorted to only on general overhaul. We have portable filtering equipment, and very elaborate stationary filtering equipment for oil treating and handling.

6544 Oil circuit breakers have their oil filtered every six months, and indoor breakers are filtered every once in two years, except, however, when an oil circuit breaker has locked

—2,794—

out, after three reclosures, and then the oil is filtered before it is put back into service. The regular crews of the substation department carry on this work.

Q. Is an active program carried on to reduce the occurrence of accidents in the system? A. We have a very active
6545 safety organization. In addition to the various safety groups in each of the departments, who have regular meetings at least once a month, and who discuss all of the latest methods of safety work, we have a full-time safety inspector, who does nothing else but safeguard employees in their work, and try to reduce their hazards. His job is to see that everything in connection with safety work is carried on as it is supposed to be. He inspects all phases of it, and is a full-time employee.

That is not the whole story of safety work by any means. It is quite an elaborate organization. When you take all of
6546 the different groups, and take all of their individual safety groups, we realize that there are a large number of meetings each year, and it is a very major part of the business.

Even on construction work, we have a very carefully worked out organization. On the new Venice plant, we have a hospital on the job, carried on by the insurance companies who are interested in the work. They have an inspector, we have one. We have a little group who get together once a week, and list the accidents or any other things which might

—2,795—

have contributed to accidents, and they make out a report once a week, and attached to that is a daily report of the accident inspection work. I glance over those from time to time.

I noticed a remark on one of them, before I started up here. The safety inspector on the Venice plant reported that one of the contractors was not placing his equipment back in the racks which had been provided for it, and was leaving shovels lying around where men could fall over them; and that will be reported to this contractor, and he will have to 6548 be more careful.

In this particular case we are going beyond our own organization and seeing to it that the contractors' men shall not have any accidents.

Q. How are relays and protective devices tested and maintained? A. The relays and protective devices on the machines and switchboards are tested at frequent intervals by special crews engaged in this work continuously. This is a major bit of work. Some of the more important relays or automatic devices may be checked once a week; others may be given routine tests at regular, but less frequent intervals. 6549

To give you an idea of the extent of this work, I should like to list for you just a few of the devices, to give you an idea of how extensive this is.

We have a regular maintenance schedule and testing

schedule on 6,842 protective relays; 2,790 oil circuit breaker control devices; 695 regulating devices; 3,758 auxiliary control devices; 2,423 recording devices; 6 oscillographs; or a total of 16,514 devices that have to be regularly maintained,

6550 inspected and tested, and require a good many men in continuous operation to do that.

But the correct operation of the system as a whole is a function of the accuracy with which some one of these details work, and in order to maintain a high degree of service reliability, it is not sufficient to have purchased and installed good equipment and put it even in the right location, but these little devices have to be in good operating condition or the whole system would not function as it should. The
6551 care with which this relay work and this maintenance work is done, is, in my opinion, a most important part of the operations.

Q. How are overhead lines and underground cables operated and maintained? A. The main transmission system is operated and maintained by three line divisions. These divisions are located at Rivermines, Keokuk and East St. Louis.

The Rivermines group work up on the Illinois side to handle those circuits. The Keokuk division is responsible for the operation and maintenance of the St. Louis-Keokuk line, which has been described. In addition, they take care
6552 —2,797—
of all the subtransmission lines in Iowa and Illinois north of Alton.

The Rivermines line division takes care of the operation and maintenance of all of the 132 kv. overhead lines.

The underground cables are maintained by the St. Louis underground division. That is a separate group not included in the other three.

To give you an example of one of these groups, the men working out of Rivermines use three cars; 7 light and 3 heavy trucks; and they have located at the Rivermines sta-

tion caterpillar equipment, and then there are three machines used by patrolmen located along the line. These patrolmen make regular inspection trips along the line, reporting every type of repair that they can observe, and those repairs are carried out by the line crews. In times of trouble those patrolmen act to help locate the place where the trouble is.

I would like to point out that we depend on the service from our Osage plant. We have four transmission lines available between the plant and the St. Louis plants, and the loss of any one of those does not cause us to lose any service, and 6554
the loss of two of them would, under nearly all conditions, not result in the loss of any service. The result is that we rely on that transmission line to the same extent that we would if the plant were in closer to town, and that means that we have to use an unusually high degree of maintenance

—2,798—

and operating attention.

The list of items that comes in after one of these inspections would not only surprise you, but might amuse you, some of the tiniest little items. A loose nut, a single nut, will be mentioned, and the crew will have to get to that and 6555
tighten it. But those are the things that cause trouble if not taken care of.

On the underground cable system, that is handled as a different and separate operation. We have to distinguish in all of our work between different types of crews. An overhead crew is specifically skilled on that work, but they would not know how to do cable work, so you can't divide cable work as to location geographically. You couldn't put a group of cables here and a certain bunch of lines, and put them in charge of one crew.

6556 So that the regular tests and cable work and repair is all handled by what is known as the underground crew, and their headquarters are at St. Louis. Once each year cable circuits are given insulation and electrolysis tests. During the hot summer months we make frequent temperature surveys, both in the ducts and in the manholes.

St. Louis, as I stated previously, has an extremely high ground temperature, and also has a ramification of railway circuits. Those two conditions have to be carefully coped
6557 with. First, we make, probably, more elaborate temperature

—2,799—

surveys in the ground in the summer time than any company with which I am familiar. We place thermo-couples in the ducts, we have thermometers in the manholes, and we have to keep going over the system to be sure that no excessive temperatures exist.

On the electrolysis work, which is caused by stray currents which usually emanate from the railway systems, getting onto our cables, and then leaving at some point, at which point they damage the sheath, the electrolysis work
6558 has required potential surveys continuously for many years, in which we go around and measure these very small potentials that exist, and try to bond or ground these cable sheaths in such a way that no damage will be done.

I have stood in the basement of our Page Avenue sub station and seen as much as 6 or 8 hundred amperes coming in over the cable sheaths. That is leakage current from railways over the system; because our grounds are better and more extensive than the railway system, the current tends to flow from their system down to our ground, and it gets there via these cable sheaths. As long as we have them

properly bonded, and take them off at predetermined intervals, we can eliminate the damage.

There is also one other condition which require constant attention, and that is the chemical action which, in certain areas, operates to corrode the lead sheath. Lead is ordinarily

—2,800—

regarded as almost immune to chemical action, but there is a peculiar combination in certain of the soils that does attract the sheath, and we have to neutralize the ducts in those areas so as to eliminate that difficulty. 6560

Q. Are overhead lines inspected regularly? A. They are. The inspections are carried on, as a rule, on the overhead lines—well, I should qualify that statement, overhead transmission lines—that is, the main lines are inspected at regular intervals and the crew at the time of inspection does not attempt to make a repair. They make a very detailed record of what they find, and that record is turned over to the superintendent of the repair work, and he assigns the repair crews to the work.

In certain other types of distribution work, we use the regular linemen, who make a combined inspection and repair 6561 at intervals, and where they find anything wrong, they fix it.

Q. Now that inspection requires climbing and other investigation, does it? A. It does. About once each month the patrolmen make inspection tours, examining structures, wires, insulators, and the condition of the right-of-way.

Once each year a climbing inspection is made, during which each structure is climbed. In that case the men go over the towers, and tighten the bolts while climbing the structures. All dirty insulators are cleaned. Frequently we have

6562 *Stanley Stokes—By Respondents—Direct*

to remove the insulators and replace them with new ones,

—2,801—

or with others that have been claimed, and bring them into the shop where we chemically clean them.

There are various things, though, that adhere to porcelain insulators in the East St. Louis district. I mention that particularly because it is a heavy industrial area there with chemical plants—it is the headquarters for the zinc industry in this country. They quote zinc as f. o. b. St. Louis. We have
6563 the National Zinc Company there, we have got a fertilizer company, a chemical company, and almost any other kind of a company; and when the combined products from all of those companies settle on an insulator, you may have to take it down and take it into your shop if you want to keep it clean.

We have found that we can clean them very rapidly with a form of chemical that we heat, just dip them in and it takes the refuse right off. We replace them with new ones on the line, and put those back in stock.

That is one of the methods that we have developed which
6564 has prevented a large number of serious outages.

Q. You have spoken of patrolmen who, in a sense, police these lines. Are they stationed at many points along the transmission lines? A. Yes. I didn't go into any detail as to their operations. We usually try to pick a patrolman who is married, and see that he is fixed up in a residence located at a strategic point along the system. A telephone will be

—2,802—

placed in his home, and in addition to that, telephone booths will be located at intervals along the line.

6565

There are certain points at which the patrolmen can always go and get in contact with one of our main stations, from which all forms of communication are available to the system load dispatcher. So that we have even gone so far that the transmission line superintendent has a radio receiver in his car, which will receive communications from the transmission line when the carrier current is in operation. These patrolmen have regular duties, to make regular patrols, in addition to which they are sent out on special patrols and do minor maintenance work such as can be accomplished by two of those men meeting at a point, and fixing up small repairs. If it is anything of any major consequence, they will call for help.

6566

Right-of-way clearing and road maintenance, and other work requiring unskilled labor—the patrolman is authorized in such instance, within limits, to hire outside help, common labor, and he reports the work done and the hours worked. He also does some clearing at various times himself.

They report by telephone to the system operator at regular intervals each day, and submit daily written reports to the line department. From these reports and those made at the time of the climbing inspections, maintenance work requiring line crews is scheduled, and the work carried out.

6567

—2,803—

Store houses are provided at intervals along these lines, and in those are stored tools and supply materials. We also locate, at certain points, spare poles, if it is a wood pole structure, and we carry certain spare tower parts in stock at Rivermines. We have discontinued, several years ago, the practice of trying to keep spare towers. The reason for that

is that there are so many types of towers, so many varieties, that you, no matter how many spares you had, probably wouldn't have the one that you needed, and it wouldn't be close to the point where you needed it. If it were the one you needed, and were right at the point where you needed it, you still couldn't use it, because our experience has shown that where a tower fails—and that is very, very rarely, once in a matter of maybe 20 years—the footings will be damaged, and you don't know to what extent, and you do not dare to use
6569 them. Consequently, your first maintenance emergency work is to put up a temporary wood pole structure, and restore service quickly. Once the service has been restored, you might just as well wait to get the rest of the tower while you are getting the few parts.

So, by some experience, we have decided that the maintenance of spare towers is not practical. I have experienced several tornadoes, and there have been one or two towers destroyed for other reasons over the 25 or 30 years, and in every case we restored service quickly by setting up temporary

—2,804—

6570 wood pole structures, and rebuilt the towers later. So that is our present practice.

Q. In the proper maintenance of these lines, do you get the cooperation of landowners in the territory covered by the transmission line? A. We not only get the cooperation of the landowners, but we go farther than that. We know the methods that were used in the early days by right-of-way people, who would get rights-of-way on a contract basis, and then would not have to live with the lines afterward.

In the old days it wasn't uncommon for these right-of-way men to promise that immediately after the transmission line,

there would be an electric railway follow, and when the power company went out to maintain and operate this line, they met with a very cool reception. Well, we, having to live with these lines, see to it that from the time negotiations begin, to acquire rights-of-way, that no enemies are made.

If we can accommodate these farmers by letting them farm a little of the right-of-way, with crops that don't grow high enough to do any damage, it works out very well, and helps keep the weeds down, and keeps them satisfied.

So we start, from the time the contracts are first entered 6572
into for the right-of-way easements or purchase, and see to it that these contracts provide for some damages to fences, and any other type of damage, crop damage or anything, so

—2,805—

that the first time that the wire stringing crew goes right through there with a caterpillar and goes through the fence, the farmer is satisfied that he will get paid for that, that there will be no loss there. He may even get a better fence. There is no trouble, and there is no more of this meeting you at the edge of the lot with a shotgun.

If we have easements where a transmission line is under 6573
construction, we recognize that the owner is entitled to complete his crop, and that that doesn't go with the easement. And we either see to it that he can, or pay him for it.

Now when it comes to operating the lines, these farmers are of great assistance to us. They report trouble. If a man sees a flash at some time, he will go to the phone and call in. If that turns out to be a case of trouble on our system, and has been of help to us, we will give him some form of nominal payment, anything from a dollar to ten dollars, depending

on how much trouble he went to; and you would be surprised how much trouble they will go to for a dollar.

So it has proved to be very beneficial. We hire them also for right-of-way clearance. That is another point. A farmer at certain times of the year has no work that he can really do efficiently on the farm. At other times he has more than he can do. In the slack periods he is very glad to get a little extra money, and we hire him to do the right-of-way work.

—2,806—

6575 Fence and creek crossings are provided, so that our regular patrolmen that have to go through regularly, can get along without damage and without delay.

Drainage ditches along the line are kept open to prevent flooding, and to prevent land erosion, and that is of assistance not only to ourselves but to the farmer. Roads and trails are maintained.

So that, in general, we make extra efforts to obtain the cooperation through these many miles of transmission line, because we have found by experience that it is profitable to do so, and an economy to the company.

6576 Q. In the construction of these lines, is it frequently necessary to cooperate with other utilities? A. Yes, we have to cooperate with the other power companies and telephone companies. That has become almost a routine procedure, and is carried out almost automatically. We both have the same requirements to meet for wire crossings, permits of all kinds, and there is very little, if any, difficulty in that particular part of the work.

With the R. E. A. groups, they are not skilled in the art in all cases, and they have to make these wire crossings, and they have to make reports to commissions, and in general

their idea is to put these lines up and get all these little items straightened out later, and we have found that it is very beneficial to help them, and at little cost to ourselves,

—2,807—

and for our own protection, by making wire crossing prints. If a wire line is going to cross under one of our transmission lines, we like to know that the clearances are going to be as stated, and also like to have a complete print and record of it, and grant this wire company a formal permit.

In order to do this, there is required a standardized 6578
print, engineering drawing, of the crossing, showing all clearances, giving a plant and elevation. We have made a number of those for some of the Illinois R. E. A. groups, and that has expedited both their work and saved ourselves considerable delay and annoyance, and they appreciate it.

Q. How are the sub-transmission circuits operated and maintained? A. It is the duty of the overhead and underground divisions of the operating departments, located at various points throughout the Union Electric Group, to operate and maintain the distribution sub-stations, transmission sub-stations, and to carry on certain construction 6579
work.

The operation includes inspection, switching, except in the plants or sub-stations; location of trouble; emergency minor repairs and replacements.

The maintenance includes the work requiring crews of men, and consists of pole and tower replacement.

Maintenance includes the clearing, cable repairs, replacement, and all other such work which is not classified as new

—2,808—

construction.

6580 *Stanley Stokes—By Respondents—Direct*

The major portion of the sub-transmission system was built by the Union Electric's own men, installed from time to time, and they maintain the system.

Q. Are maintenance groups distributed throughout the territory? A. They are. That is a matter of importance to see that these repair and maintenance groups are strategically located so that minimum delay is had in case they are called upon to handle any trouble work, and also to minimize their mileage, the mileage which they have to cover in their
6581 ordinary routine work.

The largest groups are located at Webster Groves, East St. Louis, and Alton, Illinois, and at Keokuk, Iowa.

To facilitate handling of the sub-transmission circuits, they have materials and supplies and equipment maintained at these locations in a quantity sufficient for any emergency which may arise. We have even had, as you recall in respect to our main transmission system, tornadoes, and we had ample material to repair the damage.

Q. And is it, or is it not, true that in the maintenance of the sub-transmission system as well, the testing of under-
6582 ground cable, and electrolytic testing, and dielectric testing is made? A. I fail to quite get the question.

(The question was read by the reporter.)

The Witness: There is a joint coordination of all of this work. The general supervision heads up in the load dispatcher, and in the system operators, and they are in constant communication with all of the different sub-divided groups, and in the event that a line

were being maintained, and should be required suddenly for service due to the failure of some other facility, the load dispatcher, through his operators, can contact, through this communication equipment which has been described, this maintenance crew and get that line into service before it had been anticipated.

Those things are all necessary if we want to make the fullest use of our reserve facilities. The line would not have been taken out of service without the permission of the lo[illegible]' dispatcher group, to begin with. The 6584
special telephone facilities are maintained between these operating groups and the load dispatcher and the system operators, and those facilities are in addition to the main telephone facilities which I have previously described.

These facilities also are employed in connection with the safety work, such as placing hold-off tags on equipment upon which work is to be done, and to restore the equipment to service.

Much time can be unnecessarily lost in taking a circuit out of service and getting it back again if 6585
communication and an orderly, systematic group of

—2,810—

men have not been provided. We feel that we operate that feature very carefully.

The dielectric tests of underground cable are made with a high voltage Kenotron equipment. This is a vacuum tube high voltage device, which can produce around 150,000 volts of direct current, and we take the cable out of service and apply this voltage, and

6586 *Colloquy*

gradually raise it until the test specifications which the cable is supposed to meet, have been reached. For example, take a 13,800-volt cable which is scheduled to be tested at 26,000 volts. This machine gradually raises the voltage to 26,000, and holds it there for a predetermined time. If the cable fails before we get to 26,000, that is what we wanted to know. It needed repairs.

6587 So we have periodically tested all of our cables, and the results of these testings usually are confined to the cable joints, they seem to depreciate, or maybe they never were made right in the early days. Wherever we can blow up a cable joint in tests, we feel that we have saved one failure in service. As soon as the cable fails in a test, we repair it completely and test it again, and when it finally will withstand this test, we know that it has withstood a voltage about twice as high as it will receive in service.

6588 We have rather elaborate equipment for locating faults in cables. I won't go into that in particular detail, but we have a Wheatstone bridge, which is a means of measuring resistance, and from that we

locate the probable fault within a block or two. Then we go out with what is known as a Lundin fault analyzer, and having put an alternating current wave with a very saw-toothed type of wave on the cable, we just go along with this exploring coil of this Lundin analyzer, walk right along the top of the ground, and find the point at which the fault is located. We can get

6589

that within a matter of feet, and then we know right where to go to work and pull out the damaged links.

Temperature surveys, I have previously mentioned, and also the chemical erosion and the electrolysis.

The Examiner: We will recess until 2 o'clock.

(Whereupon, at 12:35 o'clock p. m., a recess was taken until 2 o'clock p. m., of the same day.)

—2,812—

6590

6591

6592 *Stanley Stokes—By Respondents—Direct*

AFTERNOON SESSION

(The hearing was resumed at 2 o'clock p. m.)

The Examiner: Let us resume.

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

6593 Q. Just before the noon recess, Mr. Stokes, you had been describing the operation and maintenance of the transmissions systems. Could you now tell us briefly about the maintenance of the distribution system? A. Yes, the distribution system in the Union Electric group is under the jurisdiction of a distribution department in each operating division.

Distribution, as we classify it, is the operation, maintenance and construction of the lower voltage distribution circuits. In most cases these are 2,300/4,000 volt circuits.

The necessity for close contact with this system, and
6594 the volume of work that is entitled in the distribution system, requires that each system have its own organization.

They all function in conjunction with the main organization in the city who supervises the general design and the major features. All of the organizations are on exactly the same general pattern, and I shall describe the St. Louis City

—2,813—

Division which will, to a large extent, typify the other smaller ones.

The St. Louis distribution system was previously stated to represent about one-fourth of the investment in the system.

When I say "St. Louis distribution system" in this case, that is not altogether definitive. I should say the distribution system of the Union Electric group that represents about one-fourth of the total investment in the system. And it is readily observed that that must constitute a huge quantity of poles, wires, meters, transformers and other associated equipment.

All parts of the system, of all voltages, outside of the power plants—I am referring specifically now to the distribution system—are under the jurisdiction of a distribution 6596
division. The functions of the division include, first, design, engineering design, field surveys, estimating, and preparation of specifications are carried out by cooperative consultation with related departments such as the electrical power plants, and consulting electrical engineering departments. By that I mean to convey that the distribution department does their own specific engineering and does not require advice on the day-to-day functioning of either design, maintenance, or operation, but that frequently the problem in the distribution department overlaps and extends into other divisions, in which case they are required to consult 6597
with the other departments and obtain advice.

—2,814—

A simple illustration of that is a cable from a power plant to a sub-station is in the sub-transmission group as we have defined it, and yet, because the distribution department has the cable men under their supervision, they would install that cable and install the duct and they would repair it if it got in trouble. That is because it is necessary to maintain a large cable department in the distribution system, and we

do not duplicate it for the sub-transmission system, that is the cable group is really the same.

So that if a cable were to be installed, one end of it at the power plant involves an oil switch and a transformer, the other end involves a transformer and a sub-station. The sub-station involves outgoing distribution feeders. It is obvious, therefore, that if additional facilities are required at a sub-station, that the responsibilities and authorities of at least three departments would become involved. In other words,
6599 whenever a facility has to be added or changed that extends beyond the distribution system, they sometimes do not have full responsibility for that. But they do do all of their own engineering, design and operation within the strict scope of the distribution department and may extend, by joint operation with other departments, into some of the other work.

Construction involves the installation of overhead circuits on pole lines, underground cables, in conduits, or buried

—2,815—

direct in the ground with proper protection; submarine cables laid across the Mississippi River for sub-transmission and
6600 supply circuits to the distribution stations.

Operation involves emergency repairs, switching of circuits, switching out of circuits for reserve or for repair work; and the handling of circuits in emergency.

Operations also involve meter testing and periodic surveys of voltage conditions.

At this point I wish to explain that the same functions have to be performed in the distribution system as occur in the sub-transmission system, such as voltage surveys, corrosion of cable sheaths, electrolysis, and such matters.

When I discuss these items which have been previously touched on in the other divisions, I shall attempt to be as brief as possible.

In the operations—the meter testing, as such, which is strictly a part of the distribution department operation, is carried out in the meter division, which itself is under the supervision of the power plants department.

As previously discussed, the sub-transmission circuits are handled and operated under the direction of the system load dispatcher, but the distribution department is directly involved in many of these operations, and it keeps in close touch with the load dispatcher. 6602

Maintenance of the distribution system involves the re-

—2,816—

placement or repair of all parts of the system for whose operation that department is responsible. That is largely poles, wires, cables, conduits, services and many other items.

In the district outside of St. Louis, outside of the St. Louis area, these same functions are carried on but are in many instances combined with some other group for economy reasons. 6603

In St. Louis County, the operation of the distribution system is carried on in conjunction with the operation of the St. Louis County Gas Company. That company was mentioned only once, I believe, at the beginning of this hearing, and described.

The St. Louis County Gas Company——

Q. (interposing) I don't believe we need to go into the gas company at this time. A. I merely intended to mention that they worked with the distribution department and to that extent were a little different than the city group.

6604 *Stanley Stokes—By Respondents—Direct*

In the Iowa Union Electric Company, the operations up there are carried on as economically as possible in conjunction with their local requirements for that gas company in that district.

And in every respect they attempt to utilize their facilities to the greatest advantage in the interests of economy.

Q. Is the organization set up functionally? A. Yes, the

—2,817—

6605 organization is set up for a functional division of responsibility, under a superintendent of electrical distribution in each operating department. A distribution engineer is in charge of design; a construction superintendent for each major unit provides a specialized expert in each field. A cable superintendent operates for the underground cable construction and maintenance; a conduit superintendent for excavations and subway construction; an installation superintendent for all construction and maintenance facilities on customers' premises, including meters; and an overhead superintendent for each major unit of the system, for the erection of poles, stringing of wire, including the maintenance of

6606 these properties to a predetermined reliable standard; an operating superintendent, in charge of trouble service, patrols, inspection, and testing of distribution equipment, surveys of many conditions, some of which have been mentioned, such as voltage, electrolysis, cable temperatures, and all other activities not involving permanent construction or maintenance.

In this category we mentioned voltage surveys. That has not previously been discussed at length because it is primarily a function of the distribution department to ascer-

tain that all of their customers are receiving suitable and proper voltage. In order to do so, periodic voltage surveys are carried on. By "voltage survey" I mean a considerable number of volt meters are set at various points on a feeder to determine the variation of voltage from the sub-station

—2,818—

clear to the end of the feeder, and to see what voltage typical customers are obtaining. We have to watch the high voltage in close to the sub-station, at times of light loads, and low voltage at the extreme end of the circuit at times of heavy 6608 load, and to see that this variation is not greater than the prescribed limit.

A chief clerk supervises the performance of all of the clerical functions which can be reduced to a routine.

The superintendent of records maintains the system diagram, plat records of all properties, has charge of the permit and easement files and directs a limited amount of drafting work for the department.

In St. Louis County, the general handling of the distribution system is very similar.

In the distribution department there are a large number 6609 of employees. It is one of the largest single divisions of the entire company. I won't attempt to go into particular details with respect to these employees, but I would like to mention just a few of the types, and I will illustrate the number of men.

Supervisors in St. Louis city—there are 12; in St. Louis County and outlying plants—9; in Illinois, 7; in Iowa—2. In all there are 30 supervisors.

In a similar manner there are 34 engineers, 28 estimators

—2,819—

6814 *Stanley Stokes—By Respondents—Direct*

But inasmuch as the purchasing department is carrying on the complete functions from the time the order is placed, until the material is received, we send this man there under their direction, and the whole process is therefore kept in

—2,897—

one group, and under one general control. It is working out very nicely.

As an example of some of these facilities, recent emergency requirements of wire for both Iowa Union Electric
6815 Company and the St. Louis & Belleville Electric Railway Company, were obtained to their advantage, largely due to the broader contacts which the electrical buyer is able to maintain by virtue of the large volume of these products purchased for the group. Also, in the construction of a new freight office building for the St. Louis & Belleville Electric Railway Company, the department functioned not only to obtain the best bid, but also to assist the railway company materially in analyzing the proposals, together with the ability of the various contractors to best meet the requirements of the user. In other words, the Belleville Company
6816 makes very few contracts, that will be the only one of that kind that it will make for the year. And the larger group are making contracts right along, and they know the ability of these various contractors to do the work.

The department functioned to be of assistance to the Union Electric Company of Illinois in the shipment of some large transformers which were urgently required. The traffic clerks' handling of transportation and expediting, resulted in a net saving of one week's time in getting the equipment into service.

—2,898—

6817

This transportation problem required specialized handling because of certain clearance difficulties. They were too big to be shipped by ordinary route and by making a careful study, they saved that much time.

The availability of engineering buyers has been mentioned and that again is of considerable importance. I won't stress that any further, but we have made three trips back to the factory for the purchasing department in the last six months, and in each case picked up a number of changes required in the equipment just before shipment, any one of which would have more than paid the cost of these trips.

6818

It has the further advantage that the engineer who sees the equipment at the plant all assembled is in position to assist the local construction forces when it is received.

Some of this new equipment, particularly in air circuit breakers, has changed in its complexion so rapidly that the man who hasn't put in any for a year, doesn't recognize the stuff when he sees it. I mean the previous switches which he would have received would be oil circuit breakers.

6819

Q. Does the operation of a centralized purchasing department result in obtaining low unit prices? A. These activities, such as those cited, do result in low prices. The most obvious are reductions brought about by the purchasing of larger quantities with larger discounts, the coordination of standards, not only as between the various operating units,

but with industry standards, and manufacturing standards, which contributes to lower prices by the avoidance of special runs, as well as by taking advantage of increased quantities.

6820 *Stanley Stokes—By Respondents—Direct*

The broader contacts of a specialized buying group permit more intelligent appraisal of price levels, and a better timing of purchases, all of which contribute to lower first cost.

I would like to cite just a few examples, and make it as brief as I can, of this type of economy.

Take line wire, and service cable. Normal requirements of line wire for the Iowa Union Electric Company will run only about 25,000 pounds annually. Purchasing in a central-
6821 ized department takes advantage of better market timing, and based on quantities which are never less than 100,000 pounds, results in marked savings to that subsidiary.

In connection with the recent change-over from 25 to 60 cycles at Fort Madison, the Iowa Union Electric Company required 143,000 pounds of bare and weather-proof wire, which were furnished on contracts made by Union Electric of Missouri, prior to and in anticipation of the market rise in the fall of 1939. These contracts were made with copper at 10½ cents, which wire, when released to them, was taken with copper at 11¼ cents, and resulted in a saving
6822 from three-quarters to one cent a pound.

—2,906—

The same is true of Union Electric Company of Illinois, and to a lesser degree of the Lakeside Light & Power Company.

The requirements of service cable for these subsidiaries follow much the same pattern. Unit prices that they would obtain, being based on a minimum of 50,000 feet on centralized purchasing, whereas their possible maximum would only be 10,000 feet in any one order.

6823

Heavy underground cables for the transmission system, and special rubber insulated cables, are used largely in the St. Louis metropolitan area. However, such cables are occasionally required by Union Electric of Illinois, and frequently by some other subsidiaries, such as Union Colliery Company, and the St. Louis and Belleville Railway Company. For example, Union Colliery Company uses large quantities of rubber insulated machinery cable. In the last few months, we purchased, from the centralized division, 15,000 feet of this cable at substantial savings.

6824

A recent order for transmission cable for Union Electric Company of Illinois amounting to approximately $100,000, was bought at 6 per cent. below the level which would have been paid by them had it not been grouped with the other contracts.

On watt-hour meters, a quantity discount of 6 per cent. is obtained due to the large quantity which the Union Electric Company buys. It is doubtful if any of the subsidiary companies could earn any quantity discounts at all, with the

—2,901—

6825

possible exception of Union Electric Company of Illinois, which would earn a maximum of 3 per cent.

The purchase of line hardware, and line specialties, in the quantities involved for the whole group, is consistently made at price levels ranging from 5 per cent. to 15 per cent. under comparable prices if each individual unit were to make its own purchases.

Q. I think you have illustrated sufficiently the point you were making.

6826 *Stanley Stokes—By Respondents—Direct*

In the operations department, is it necessary to employ a salvage salesman to dispose of salvaged material? A. Yes, the purchasing department employs a full-time salvage salesman. That is really a pretty good sized business, and he sells everything from the scrap materials to machinery. When you finish a large job, you don't try to carry over machinery for many years, you sell it and buy it again if you need it. So that when the Osage project was completed, there was a large amount of machinery on hand which had
6827 to be disposed of, and as a regular process we burn the insulation off of old wire and strip the lead off of cables, and reduce it to scrap copper or scrap lead, or scrap of other kinds. We do some salvage too, in which some of that stuff which is in pretty good condition is repaired and put back into service.

The subsidiaries' scrap are all accumulated into the cen-

—2,902—

tral warehouse, and all handled at one time. We get from half a cent to a cent a pound more by getting it all in one group that way, than the small companies would for their
6828 small quantities.

The Examiner: Let us have a short recess.

(Whereupon, a short recess was taken, after which the hearing was resumed.)

The Examiner: Let us resume.

The Witness: I merely want to illustrate the magnitude of the scrap transactions. A single transaction recently involved the sale of over a million and a quarter pounds of accumulated scrap wire, and the

6829

other surplus in scrap represents about $40,000 a year, or something on that order of magnitude.

By Mr. Hamilton:

Q. Does the operation of the department involve the study of the applicability of various sales tax statutes? A. Yes, the matter of properly contracting for, delivering and applying equipment, requires, these days, that some reasonable study be given to the matter of sales taxes and other features. This is something of importance. For example, 6830
one individual purchase transaction made during the past several months has involved the question as to the proper applicability of taxes in amounts ranging from $2,000 on one item to $27,000 on another. In other words, by a certain

—2,903—

process of buying and shipping, you can resolve what appears to be an interstate commerce transaction into a mere intrastate transaction, in which the combination of circumstances might require you to pay sales taxes, and if the same transaction is handled in some other manner, only slightly different, it does not require you to pay any. 6831

Q. Without going into detail, will you give us very briefly the general pattern of the operation in your warehouses and storerooms, which I understand from your previous testimony—in which you have to some extent located the physical facilities—is an item of substantial importance in the operations of the system? A. Yes, the various storerooms and the handling of material are one of the major items of the company's business. I am trying to condense and reduce my remarks on this, to a very minimum, but I

must mention the central stores office, which is a clearing house and a control center for all the stores operations, and there is where the general stock records are kept, and the headquarters of the general storekeeper and his assistants. It is a pretty large department. I know there are some 35 or 40 clerks there in the one room, just by observation, and the utility shops and other facilities there.

The particular location of this general storeroom is at 19th and Gratiot Streets, and at that point they have just

6833 —2,904—

recently constructed another large material handling area, with modern facilities.

—2,905—

In addition to the stock record, it is the function of this office to see that the minimum quantities of stock are at all times on hand, and replenish the stocks as fast as the minima are reached, and to see to it that the previously set maximum amounts are not exceeded.

Q. You might give us, if you will, the number of em-

6834 ployes who devote their time to this particular phase of operation, and also the extent of the transactions handled. A. There are six store rooms located at six of the power plants, and quite a number of other individual points at which material is distributed, in addition to which this same stores department serves the properties in both Missouri and Illinois.

The number of employes for the past year, or at some point toward the end of the year, amounted to 181 at the time this count was made.

They include two employes at the store room of the Mississippi Power Company and one at the Iowa Union Electric Company.

In the operation of the stores department facilities, some 20,000 different items of material are stock, the average value being about two million. About 350,000 items are received, and 760,000 disbursed annually. The approximate value of the net annual issues of material is three and one-half million dollars.

Excluding fuel and other items which do not pass through 6836
the accounts of the stores department, 325 railroad cars of materials are unloaded annually, and a further large quantity of materials received by truck. Twenty hundred tons

of scrap material are shipped annually.

Q. Now, very briefly, the major objections of this particular department. A. Well, the first objective in any stores department, and certainly in this one, is to render adequate service to the various company divisions, so that they get the material they need when they need it, and to have available adequate personnel and adequate transportation equipment 6837
to get the material on the job when emergencies occur.

I could describe several examples of that particular case, including two tornadoes, and the general object there is to keep the structures and the yards properly equipped to do a big job when necessary, and to do the regular job efficiently.

The second objective is to do the things that are required as economically as possible.

For example, at the Cahokia plant all materials required are delivered by store employes direct to the location where

6838 *Stanley Stokes—By Respondents—Direct*

needed. This gets the material to the job faster, and is more economical, because it eliminates the time of mechanics making frequent trips to the store room.

For example, it is about a half a mile if you go the length of that plant and back, with a piece of material, and for a high-priced electrical employe to make such a trip consumes considerable time, particularly if he does it on foot, which he would.

—2,907—

6839 The store room, which is located in the yard near the power plant at Cahokia, has little—what are generally referred to as scooter cars—and they come over to the main plant with ordinary supplies of bolts, nuts, and so forth, go right into the elevators, go up to the sixth floor, and right out in front of the boilers, wherever it is, and deliver the material right to the place where it is needed.

That can be done in a fraction of the time that used to be required when they let the employe go and get his own material from the store room.

6840 Mechanical handling of equipment is used almost throughout our whole system. We have all forms of mechanical handling devices. By that I mean such things as a stacker. That is a little electric truck that runs in and goes under the box, or whatever it is, and elevates it, and stacks it up on all of the other boxes. All of the stores material of the heavy type is mounted on raised platforms, raised so that this equipment can run under it, pick it up and take it wherever it is wanted, and set it down again without the necessity of a man having to lift it.

 6841

The possibility of accidents in handling materials is quite great, and the stores department is particularly active in its safety work.

Q. Now, is the work of this particular department coordinated as among the various companies in the group?

—2,908—

A. It is, completely coordinated. The fact is that it serves the various companies just as though it were one operating unit. In fact, I expect if you were to ask some of the employes of the stores department, I doubt if they know that in 6842
some of these cases they are working for separate subsidiary companies. That is, they treat the material delivered to the Illinois-Cahokia plant just the same as they do to the store room in St. Louis County, which supplies the gas company.

The unified stores system has materially reduced the cost per unit of handling equipment and materials.

It is a big economy in the floor space, which after all is expensive in these warehouses, to operate them jointly for the whole group, because if each one has its own store room location, in many instances they would be in the same location
that the joint one is now. 6843

For example, I think of the St. Louis County Division; they have a store room near our Page Avenue sub-station. I know the electrical department would have to have one at that point, and the gas department would need one in that immediate vicinity. And the single store room handles both equally well.

Q. What do you regard as the criteria of a high-quality electric service? A. I should define high-quality electric service as primarily constituted of three factors, first, con-

6844 *Stanley Stokes—By Respondents—Direct*

tinuity of service; second, voltage regulation; and third, the frequency control or regulation.

—2,909—

In comparing those three as to importance, I should say that—it is a little difficult to state which is the most important because if any one of them were fully lacking you would have no service, and all of them have to be supplied and have to be the best available if we are going to have a resultant high quality service.

6845 To state specifically and grade electric service is a rather difficult matter, but to obtain a relative idea of a very high-grade service, as compared with a slightly lower grade, is not difficult.

Q. Now, if you will, discuss each of these criteria as applied specifically to the Union Electric Group. A. In the Union Electric Group, the effort has been made consistently for years to each year improve the grade of service rendered. We also have to keep in mind at all times the value delivered to our customers per dollar, and the co-ordination of those requirements to give the customer the most for his money is

6846 the ultimate objective.

Now, discussing the service feature, I should say that if I had to place the greatest value on any one, I would say that continuity of service was the most important. The degree to which service is continuously available is a measure of its quality. The continuous service or nearly continuous service is to be had only as a combination of a number of factors,

—2,910—

among which may be mentioned the suitable design carried out under the direction of competent engineers, the most reliable apparatus obtainable, and the duplication of facilities

where required, so that in the event one method of supply fails, another is available to take its place, and last, but not least, adequate operating forces supplied with proper equipment and under the direction of experienced and highly skilled supervisors.

The fact that this group of companies has a long record of highly continuous service is a result of the conscientious adherence to these principles. In the description of the property we have previously discussed the fact that all of the power plants were closely interconnected by duplicated main 6848
transmission service, also that the sub-transmission system always had another cable to take the place of the one that might be in trouble, and that the transformer banks at the substations and power plants were duplicated.

—2,911—

In describing the power plants themselves, we showed how the buses were duplicated and how facilities had been provided to transfer turbines from one bus to another, and similarly for feeders and associated equipment.

I am going to make this comparison of these facilities 6849
just as brief as I can to bring out the point which I am trying to make, namely that all of this equipment has to be provided and suitably designed and coordinated if continuous service is going to be available.

We then, after describing the equipment itself, described the operating forces and their facilities, and their strategic location of warehouses and other facilities and transportation equipment to maintain the service and to restore it as quickly as possible.

6850 *Stanley Stokes—By Respondents—Direct*

Our operating forces are highly paid, experienced men with, on the average, a long record of service with this particular group of companies. The result of the coordination of all of these facilities is that the Union Electric Group renders what in my opinion can be stated definitely to be high quality service.

Not since 1907 in the early days of the electric light and power industry has this system sustained a complete shutdown. At that time the entire district was served by a single
6851 steam plant in St. Louis. Trouble there shut down the entire plant and caused the complete interruption of service for a number of hours. Such a situation would be hard to conceive under the present unified system of interconnected

—2,912—

generating stations.

Now, in attempting to describe continuous service, it is a little difficult to get exact bases for such description. I attempted to make an analysis of the seven months from April to September, 1940, to determine at the present time what the probable percentage of continuous service that a
6852 customer of the Union Electric Group might anticipate would be.

The calculations for that particular period which were based on a customer outage probability of once in 4.22 years worked out, on the calculating machine, to indicate that the customer has trouble-free service, that is, he has continuous service, for 99.99729 per cent. of the time. I tried the same thing for year ending September 27, 1929, and at that time the customer had an average outage once in every 1.39 years, which gave him a percentage of 99.99179. Now it is obvi-

ously difficult to discuss percentages of that type, and a more satisfactory approach is to analyze the interruptions to service and to indicate improvement by giving the reduction in the number of interruptions.

This method consists in describing the bad part of your service when you are attempting to state that it is good service, and is a little bit awkward, but seems to be the only suitable method.

Q. If I may interrupt you just a moment, you used a figure in your testimony of one customer outage in something 6854
like 4-plus years. Is that the present record of performance?

—2,913—

A. Yes. I stated that,—or I meant to indicate that it was the experience in the seven months ending with September of 1940, which period we have just analyzed; and the other figure of one in every 1.39 years reached back to 1929.

The object there was to indicate improvement in the service in that interval of time.

A similar situation exists when one discusses transformers themselves. A large power transformer may run
99.15 per cent. efficient, leaving only .85 per cent. for all 6855
losses. So when such equipment is being analyzed and attempts made to determine what the nature of the losses are, we usually describe the losses, such as iron loss and copper loss, and not the transformer efficiency as a whole. But in so doing it should be kept in mind that we are devoting our attention to the .85 per cent. and expanding it, and not to the 99.15 per cent.

Now discussing some of the major interruptions in the last 33 years, since that period in 1907 when we lost the

total load on the system and which has not occurred since, I have examined the records and have picked out what appear to me to be cases of severe general system disturbance, that is not located with respect to just one feeder or one customer, but outages which affected the whole system for a period of time long enough to be measured and to be appreciable.

There were 15 such cases in the 33 years. The greatest

—2,914—

6857 duration of any of those cases was brought about by the tornado which St. Louis suffered in September of 1927. This storm severely damaged our Venice power plant and destroyed the Venice sub-station. Since the greater part of our city transmission system is underground, areas other than struck by the tornado were only affected for a moderate length of time.

—2,915—

In the tornado area itself, we did not have all service completely restored for about 5 days, but in most cases, service was made available as quickly as the customers were in

6858 position to use it.

The largest single loss of load in the period of 33 years resulted from a difficulty in attempting to synchronize No. 5 generator at Cahokia on September 3, 1931. This resulted in a temporary loss of 97,000 kilowatts of load, most of which was almost immediately restored, and the remainder completely restored within 34 minutes after the occurrence of the interruption.

I attempted to arrive at some other basis for the accumulated effect of these major outages, and although this has to

6859

be given as a very rough approximation, I totalled up the production of the kilowatts stated to be lost, and the time during which it was stated to be out, and added those figures together. With the exception of the tornado outage, I concluded about three-quarters of a million kilowatt hours should represent the approximate total duration of outage for the period.

Q. What period is that? A. That is the period from 1907 to date, and was occasioned by these major outages. That, placed on a percentage basis, is very small. I didn't attempt 6860
to do that, but to illustrate, we expect to have a send-out for the year 1940, approximating 3 billion kilowatt hours, and

—2,916—

three-quarters of a million would be a very small percentage of the one year's send-out alone, not to mention the previous 32 years. So it is obvious that the customer gets continuous service.

Q. You have also spoken of good voltage regulation as being another test of high quality service. Does the Union Electric group maintain good voltage regulation? A. I think 6861
I can say that Union Electric group makes more than an ordinary effort to maintain good voltage regulation. I stressed that in some of my previous testimony with respect to the amount of special equipment which we have available for that purpose, with particular reference to load ratio control transformers. Those are a type of main power transformer which handles tansmission lines, and is so designed that step regulators can step the ratio of transformation up and down while the transformer is in operation.

Also synchronous condensers and other associated equipment are in extensive use on our property, and I believe in more than the customary amount.

These features, together with the fact that practically all of our distribution feeders are equipped with the highest type of voltage regulating equipment, are all conducive to good voltage regulation. The fact that the voltage is good at the customer's premises, is not left to chance, but is determined by voltage surveys.

6863 —2,917—

Our voltage level itself, that is the lamp voltage level, whether 115 volts or 120, is carried at the most approved value, as measured by recent standards, and the voltage variation at the customer's premises is kept within close limits.

Q. Has the Union Electric group been successful in maintaining close frequency regulation? A. We have no difficulty in maintaining good frequency regulation on our system. We have no particularly severe types of load to handle, which represent a major portion of our load. By that I mean, for example a most severe load to carry would be that of a

6864 big steel mill, if it represented a large percentage of the system. We have one or two such loads, but they are not a big percentage of our total capacity.

The governor performance is constantly being observed and studied and at the present time our frequency regulation is sufficiently good, in fact better, than the requirements of any of our customers, and our chief object today is to acquire and improve our governors so that in the future, when new processes may be developed that require closer regulation, we will be in position to provide it without undue expense.

 6865

By increased requirements for closer regulation, I have in mind primarily future interconnections or any type of connection which requires that different parts of the system be maintained in synchronism with themselves, or with other systems, without unnecessarily transferring load. Surging is a good way to express it. The question that arises

—2,918—

in this connection is as to whether these requirements for precise frequency control are really a provision for the customer or whether they are not primarily a function operation 6866 of the system itself.

In any event, the complaint on frequency, I believe almost never arises—I don't recall any myself in our district.

—2,919—

Mr. Hamilton: Will the reporter please mark this diagram as Respondents' Exhibit No. 55 for identification?

(Respondents' Exhibit 55 was marked for identification.)

By Mr. Hamilton: 6867

Q Please explain what Respondents' Exhibit No. 55 for identification represents? A. This represents what is known as an oscillogram. It is a photostatic copy of the actual film record which is obtained from an electrical device known as an oscillograph. In this particular case this instrument is an automatic oscillograph.

Q. What are the two instances shown on the record in the chart? Are these instances of trouble that have been recorded on the oscillograph? A. Yes, they are.

6868 *Stanley Stokes—By Respondents—Direct*

Q. Before attempting to describe it generally, I would like to offer this in evidence, and I simply want you to state whether this is a true and correct record of the particular instances which the diagram purports to represent in so far as you are able to make that statement? A. This is. This is an actual photographic copy of an instance which occurred in operation, illustrating a typical type of trouble, and the analysis thereof.

Q. The facts shown are taken from the records of the

6869 —2,920—

Union Electric Group? A. They are, they are taken from the records of our department which handles cases of transmission line trouble of this type.

Mr. Hamilton: I offer the diagram in evidence as Respondents' Exhibit No. 55.

Mr. Odell: No objection.

The Examiner: It is so admitted under the number mentioned.

(Respondents' Exhibit No. 55 was received in

6870 evidence.)

By Mr. Hamilton:

Q. Will you refer to the various abbreviations appearing in the left-hand column of the exhibit, Exhibit No. 55, and explain their meaning? A. The first abbreviation there with the figure "1" and the Greek letter "Phi", refers to phase No. 1, and you read it phase No. 1 to neutral volts, meaning that the wavy line on the top of the chart is an indication of the voltage between phase No. 1 and ground, or neutral, the neutral being grounded.

 6871

The next abbreviation below that indicated as "Ven. Page No. 1 Grd. Cur." refers to Venice-Page circuit No. 1, and the wavy line shown is a measure of the current to ground in that circuit during a fault condition.

—2,921—

The next abbreviation, "Cah. Ven. No. 1. Grd. Cur." refers to Cahokia-Venice, Line No. 1, ground current, the current itself being indicated again by the oscillogram.

Q. In order to shorten your statement, will you merely read, without abbreviations, the balance of the detail shown 6872
in the left-hand column? A. The next line below is Cahokia-Venice No. 2 circuit, ground current.

Incidentally, these Cahokia-Venice circuits are the 66 kv. tie-lines between the Cahokia plant and the Venice plant, which were referred to many times in our previous discussion.

The next statement below in the left-hand column is Bus Tie, Ground Current.

The next one below that is Venice-Stallings No. 1 circuit, ground current. The Venice-Stallings circuit is one of the 6873
66,000-volt steel tower transmission lines leaving the Venice plant, and supplying service to the Illinois-Iowa Power Company.

On the same side of the chart and further down we read North Bus Potential, phase 1 to phase 2.

Below that, Cahokia-Rivermines, circuit No. 1.

Below that, Cahokia-Belleville, circuit No. 1.

Below that, Cahokia-Rivermines, circuit No. 2.

Below that, Cahokia transformer banks Nos. 1 and 2.

—2,922—

6874 *Stanley Stokes—By Respondents—Direct*

At the bottom, South Bus Potential, phase 2 to phase 3.

Q. Now state, if you will, what the oscillograph is, what it does, and what the significance of this particular collection of lines shown is, as related to the operation of your system? A. An oscillograph itself is not a very recent de-

—2,923—

vice, it has been used in various forms for many years to obtain a photographic record of a varying current.

6875 The application of the automatic oscillograph, which is left in continuous contact with the main transmission circuit or power plant, is a relatively recent idea, and with the intention of improving our service by obtaining more knowledge of what took place, when an outage occurred, we installed one of these devices. They are relatively expensive. I think they cost on the order of $3,000. As the results of the first one were so very good, and we learned so much about the operation of our relays and switches, we gradually extended them until we now have eight, at the major points on the system where switching occurs.

6876 The automatic oscillograph gets into operation within less than a half cycle after trouble occurs on the line. In other words, it gets into operation within 1/150 of a second, and from there on it records all the operations which take place in a very short interval of time.

On this particular chart, all the trouble is over and the system has been restored to normal by the time you read from left to right through the numbers at the bottom of the dark part of the chart, and get to No. 5. In other words, that is about three inches of the chart there, and the system service is back to normal and the total elapsed time up to

6877

No. 5 is 16 cycles, or 16/60 of a second, in which all of these

—2,924—

things have taken place.

Now, there is no other known way of determining, in a case of this kind, what really happened, and I should like to describe a case of trouble to which this refers, and outline how we were able to improve the service by reason of the knowledge obtained.

In this particular case there was a circuit interruption on the Cahokia-Venice No. 1 line on December 14, 1937. That line, while carrying 58,000 kilowatts of load, relayed at Cahokia and Venice, at 6:14 p. m. the circuit was cleared rapidly at both ends by balanced type relays known as the RDC type. These are what are called phase balance relays, in which the current in one phase is balanced against the current in another phase. The number of this particular relay was No. 3 Group.

6878

No load was lost since the No. 2 circuit, that is the parallel circuit, immediately picked up all loads with slight disturbance to the system.

6879

At 7:50 p. m., the patrol crews reported the ground wire on No. 1 circuit had come down between Towers 4 and 5 within one mile from Cahokia. At 10:35 p. m., the broken wire was cut out, the hanging ends tied up temporarily, the circuit closed at Cahokia and Venice, restoring the system to normal.

Keep in mind that there was no load lost during this operation.

—2,925—

6880 *Stanley Stokes—By Respondents—Direct*

The oscillograph records from Cahokia and Venice show that the No. 3 phase, which is the bottom wire on the tower, only, was involved with the ground wire. This would indicate that the ground wire broke and fell and contacted the bottom conductor as it went down. Inspection made on a portion of the conductor showed the outer strands to be broken in numerous places, which indicated that the ground wire had broken from mechanical reasons.

Copies of the oscillograph record from Cahokia and
6881 Venice showed that the line cleared at Cahokia in slightly less than five cycles, .078 of a second, and at Venice, one cycle later. The total ground current at the fault attained a maximum value of 10,200 amperes, which is equivalent to 1,160,000 k. v. a., three phase.

It is of interest to note that the fault in this instance was of greater magnitude than any other previously recorded.

Now, to describe the oscillogram itself, if we examine the condition marked No. 1 along the bottom of the dark part of the chart, and refer to the typewritten matter on the right hand side, near the top, you will observe that at Condition 1,
6882 which is 2½ cycles from the start of the chart, and you read this chart from left to right, starting at the left hand edge and measuring from one of the little wavy points to the next one is a cycle, or from the middle of one to the middle of the next one is a cycle, that is, until you get to the same position

in the current wave from one to the next—then you have completed a cycle. If you started at the top, you would simply go to the next top, or if you started in the middle, you would go to the bottom, back to the top, and then down to the middle again.

So in Condition No. 1 we have completed 2½ cycles from the beginning of the disturbance, and at that point the current and voltage use are stated in the table just below in the middle of the right hand side.

—2,927—

For example, the voltage from the phase No. 1 to neutral or ground, which is the same thing in this case, was 36,750 volts, at condition No. 1. That is, at that instant. A little later, at condition No. 3, which is 5½ cycles from the beginning of the chart, the voltage has risen to 37,700, and by 6884
condition No. 5, by that time, which is 16 cycles later, full voltage is again on the system. That 40,300 volts represents the full voltage from phase to ground on a 66 or 69 kv. system. I should explain that this 66 kv. represents the voltage between wires, and from the neutral or mid point of a 66,000-volt triangle, the voltage measured to either leg from the center would be 40,060 volts, which is arrived at by taking 66,000 volts and dividing it by the square root of 3.

Now, at condition No. 3, which was 4.25 cycles from the start of the disturbance, the Cahokia-Venice No. 1 circuit 6885
was cleared by the oil switch at Cahokia. That is very rapid clearance to clear the circuit in 4.25 cycles. By condition No. 4, which was 6¼ cycles from the beginning, the Cahokia-Venice No. 1 line cleared at Venice.

So you will observe by looking at these various amperes which I shall read from this chart that Venice-Page No. 1 circuit had, at 2½ cycles after the start, 1,173 amperes to ground which decreased to 913 at condition 3, which is 5½ cycles from the beginning, and went to zero. In other words,

6886 *Stanley Stokes—By Respondents—Direct*

the circuit cleared before we got to the next checking point which was condition No. 5.

—2,928—

In a similar manner, the other currents can all be observed from the table showing that in one case the Cahokia-Venice No. 2 current supplied from that circuit built up to 2,430 amperes at about 5½ cycles from the beginning.

If you look at the wavy lines on the chart, I should explain that the height of those lines above the center of the
6887 axis is proportional to either the voltage or current, and we have constants that permit us to measure that. When the line opposite Venice-Page No. 1 ground current, as shown on the left, becomes a straight line and ceases to have any wiggle, then that means that the current has gone to zero, and you will notice just before it cleared that the current rose to a very high value.

Now, the net result of this thing, without going into a further detail, is that at the top of this chart we have the complete record of everything that took place at Venice, and in a similar manner, the lighter part of the chart below
6888 is the record of everything that took place at Cahokia on these circuits, with respect to the switching, and we know that the Cahokia switch is cleared first in 4½ cycles, and that the Venice in 6¼, and we know what value of ground currents and short circuits we have to deal with.

For example, we can state from this record that the short circuit was 1,160,000 k. v. a., which would make it questionable as to whether we could count on 1,000,000 k. v. a. switches or breakers. In our new plant we are actually

—2,929—

installing 1½ million k. v. a. breakers.

The conclusion to be drawn from this thing is simply this, that during a period of less than 1 10 of a second, there were a large number of operations which took place, and before we had this type of instrument we had no more idea, we had no idea whatever, as to which one took place, or whether they cleared as they should or not, and this permits us to check the performance of our relays, our switches, and in general is the thing that permits intelligent maintenance and operation of the equipment.

I should explain that in this instrument there are a 6890
number of different elements, each is a little individual mirror which operates when the current itself is thrown into the instrument, and that mirror moves a beam of light, which produces this wavy line on the film, and each of these little elements can be connected into any circuit when desired, and although we show the current for Venice-Stallings No. 1, it wasn't in trouble and nothing happened. That is the bottom line on the top part of the chart. It was zero all the way. There was nothing going on, but the oscillograph was connected in that circuit.

It also tells us that the No. 2 Venice-Cahokia line, which 6891
fed into this same short by reason of the fact that the phases are connected at both Venice and Cahokia, so that any fault

—2,930—

on No. 1 line would be fed from each end of itself, and each end would also be fed from the corresponding line, and if you will look down at the bottom chart, you can see that the Cahokia transformer banks fed in at condition No. 1, 7,870 amperes, and that the bus tie at Venice, at condition No. 3, transferred 3,360 amperes into the fault.

—2,931—

That I believe is taken to illustrate the application of these instruments, and in turn illustrate the fact that we are making every effort to improve our system operation.

Q. Did I understand you to say that the particular disturbance recorded did not result in an interruption of service? A. None whatever, the parallel [redacted] continued to function right straight through, and if you will observe in the bottom chart, the table to the right of the bottom chart, the top line is marked potential from phase 1 to phase 2, and
6893 the voltage there is shown as condition No. 1—68,200 volts, 67,000 volts, and 69,700 volts. So that that shows that the potential was normal between those two phases, and the other circuit was not particularly affected at any time.

Q. Had the disturbance occurred prior to the oscillograph, would you have been aware of the existence of the disturbances? A. Yes, we would have known there had been a disturbance all right, and if the switches had cleared all right we wouldn't have known just how they functioned, and if they had failed to clear we would have had no record as to why. The principal advantage of this chart is to permit
6894 the intelligent knowledge of what has taken place so as to apply it to future occurrences, and to avoid anything that isn't right.

Now in this particular operation here, all the equipment worked correctly, but if it had not done so, we would have learned from this chart.

—2,932—

I should like very briefly to describe one or two other cases without extending them at all, to show what the oscillograph does for us.

6895

An outstanding example of the value of such an instrument was demonstrated by an outage experienced on the 132 kv. transmission line between Osage and Page Avenue. In this instance the line trip-out occurred simultaneously with the flash over of a generator at the Osage plant, and it was generally believed that the line trip-out was due to incorrect relay setting and as a result of the machine failure. That was our conclusion as a group of engineers analyzing the trouble. When the film from the oscillograph was developed, it showed conclusively that a lightning stroke had 6896
first involved the line conductor, and that the line had relayed properly, and that the attendant surge as a result of the lightning stroke, had caused the machine to flash over. In other words, that there was a lightning stroke, and that the machine flash over was the result and not the cause of the trouble.

Many times an incorrect conclusion like that from a case of trouble will cause the operating group to go out and change the setting of relays, which in themselves were originally correct.

Another case which illustrates that occurred at the Cahokia Rivermines 132 kv. circuits. Both circuits relayed simul- 6897
taneously at Cahokia and Rivermines. First reports indicated a flash over of one circuit from lightning which would

in this particular case have indicated an incorrect relay operation from the other circuit. It should not have gone out and it did. That was a relatively short time after we had put in this new system connecting Osage, and we were much disturbed about it because we thought we had done a very careful job on those relays.

6898 *Stanley Stokes—By Respondents—Direct*

When the oscillograph record was obtained it showed that in addition to this stroke of lightning which we assumed was the only one, that there had been another lightning stroke within 3/100ths of a second after the first, and on the second circuit at a point 20 miles away.

We sent the patrolman up there and located the trouble.

Now that proved that the relays operated correctly, and that there were two cases of trouble at the same time, only one of which did we know about. The damage at the tower
6899 was located, which proved conclusively that the lightning had struck the other line.

The oscillograph by the way permits knowledge of this ground current and a knowledge of our ground resistances, which we keep, permits us to anticipate the location of the trouble and in many cases the man who works up this chart is able to predict the trouble within three or four spans. We can't guarantee that accuracy, but it has occurred that he has predicted the trouble very closely.

In one case we sent the patrol crew out for the third time

—2,934—

6900 before they found it, basing our conclusions entirely on the fact that it ought to be there as shown by the chart.

That is an illustration of the efforts that are made to maintain reliable service.

Q. Can you tell us approximately when the oscillographs were installed? A. I think these particular ones have been added gradually for the past four or five years. The first one I think was put in about five years ago.

This Rivermines case was the first we had, I think, and that might have been six years, but it is more likely to be five.

—2,935—

6901

Q. Are you able to give us any other comparisons indicating improvements in service over a period of years? A. Yes, from our records we can provide indications of the nature of improvements in the service. I shall read a couple of figures which I have worked up here, and placed in a table, to illustrate this point.

The average rate of failure of distribution transformers in 1930 was 15 per thousand transformers per year. In 1939, the rate had dropped to 6 transformer failures per one thousand transformers, an improvement of 60 per cent.

6902

In 1930 there were 15 cases of distribution wire down per thousand miles of distribution wire in service, as against 6 cases in 1939, or an improvement of 60 per cent.

I have one or two other statistics that I think are worth mentioning to show the improvement.

In our cables in the voltages of 2,300/4,000, up to and including 6,600 volts, the failures per hundred miles of cable per year in 1930 were 21, and by 1939 that had been reduced to 15, an improvement of 28.6 per cent.

In the operating voltage of the 13,000 range, the failures in 1930 were 18, and are now 16, an 11.1 per cent. improvement.

6903

In the 33 kv. cable failures per 100 miles, per year, in 1930 were 42, as against 9 in 1939, an improvement of 78.5 per cent. That was largely due to improvement in the method of making the cable joints.

—2,936—

Now in interruptions per circuit in the distribution circuits, these are the ones that affect the customers' service more than the others, because these transmission interrup-

6904 *Stanley Stokes—By Respondents—Direct*

tions as a rule are taken care of by alternate circuits, but in some of these interruptions which I now indicate, the customers' service would be affected.

In the low voltage class, 6,600 volts and below, the interruptions per circuit were, for 1934—.3 per circuit per year, which had been reduced to .1 by 1939, an improvement of 66.7 per cent.

In the 13,000 volt class of circuits, the interruptions for 1934 were .65, and by 1939 they were .33—again a 49.3 per
6905 cent. improvement.

In the 33 kv. class, the interruptions were .7 for 1934, and .25 for 1939, an improvement of 64.3 per cent.

To interpret these very briefly, to see what they mean, there were 6 transformer failures per thousand transformers in service in the year 1939. The probability is that we may expect one failure every 166 transformer years. Again, with an average interruption per circuit for 1939 of 0.1, another way of stressing that would be that we will, on the average, have one circuit interrupted every ten years.

The above examples of reductions in equipment failures
6906 and circuit interruptions are typical of the results of con-

—2,937—

tinuous efforts by the operating and engineering personnel to analyze troubles and eliminate or reduce, in so far as possible, the causes of such troubles and thereby improve the service rendered to the customer.

The Examiner: We will recess until 2 o'clock.

(Whereupon, at 12:35 o'clock p. m., a recess was taken until 2 o'clock p. m., of the same day.)

—2,938—

AFTERNOON SESSION

(The hearing was resumed at 2 o'clock p. m.)

The Examiner: Let the hearing come to order.

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Are you able to give us, Mr. Stokes, any statistics in- 6908
dicating the trend of service calls per customer over a period of years? A. Yes, I have examined the records of the trend of customer service calls, and have noted a consistent reduction in the number of service calls per year. This indicates an improvement in the grade of service rendered.

The total records for the customers for the City of St. Louis, commercial and residential classes, have been examined, and I would like to produce the figures for the year 1917, and at 5-year intervals since then, approximately.

I won't read all the detailed figures, but in the year 1917 the service calls per customer, per year, for that year, were 6909
.907; in the year 1922, five years later, they had declined to .329. By 1927, they had become .202. In 1932, they were .191, and by 1940 they had, for the 9 months to date, become .170. That is the annual rate, however.

—2,939—

Q. In the case of 1940? A. Yes. It is at the rate, however, of .170 per year, which is consistent with the other figures.

This represents an average interval between calls for a single customer of—in 1940—5 years and 10.6 months. This

6910 *Stanley Stokes—By Respondents—Direct*

corresponds to an interval of one year 1.2 months elapsed between calls for 1917, which indicates an improvement in the service.

Q. These are trouble calls you are referring to? A. They are really trouble calls, yes, they are calls where the customer has inquired something about the service itself. I have eliminated miscellaneous calls about other subjects.

Among the features which I think are of interest in connection with good service, should be mentioned the free lamp
6911 renewal privileges. All lamps are not renewed free, but practically all of the sizes that are in regular use, are, in the residential service. That has a beneficial effect from the power company's viewpoint, that the customer keeps the sockets filled up and keeps lamps where they should be.

Q. Do you happen to know whether the Illinois Commerce Commission has established ratings for service as among electric utility companies? A. Yes, in Illinois there is a specific method set out by the Illinois Commerce Commission for rating the quality of service rendered.

—2,940—

6912 Q. Has Union Electric Company of Illinois been so rated, and if so, how? A. Yes, the Union Electric Company of Illinois has been rated. Pursuant to what is known in Illinois as General Order No. 65, the Commission established an engineering section whose duties are to investigate and determine the grades of service rendered by the various utilities throughout the State.

Service engineers visit the various companies, examine their records which are required by their order to be kept, and the examination includes such items as continuity of

6913

service, voltage regulation, meter testing, maintenance, and some other less important items.

They have quite a crew of service engineers, who go around to different cities and locations, and set their own meters, make measurements, and examine the records, and as a result of which, by a method which they have worked out, they determine, by weighting these different factors, what grade of service is being rendered, and they give reports each year, or almost every year.

6914

In this case the Union Electric Company of Illinois, in the Commission's report of "Grades for Electric Service", dated February 1, 1940, compiled from the latest grades assigned prior to January 1, 1940, the Union Electric Company of Illinois was ranked next to the highest in the State

—2,941—

among 29 Class A companies—those are the large companies. The grade itself was 96.44.

In addition to grading the companies themselves, they also grade the service rendered in the different cities. The highest grade in Illinois for that year for service in a Class A City—that is the larger cities—went to the City of Alton, Illinois, served by the Union Electric Company of Illinois, with a grade of 96.86. That rating was just a little higher than Chicago.

6915

In the first five cities in this group, the Union Electric Company of Illinois had two of its towns included, Alton and East St. Louis.

This grading, by an impartial authority, indicates a high standard, the high standard of service being furnished by this company.

We have no similar method of grading established in Missouri.

—2,942—

Q. Turn now to the operating staff of the Group, Mr. Stokes, and I would like to have you describe briefly the names, capacities and functions of the principal members of that staff, excluding, if you will, the higher executive officers, who wil' be covered subsequently by a later witness. Will you proceed with that description? A. Starting first with
6917 the secretary of the Union Electric Company of Missouri, his name is Frank J. Meistrell. Mr. Meistrell is 38 years of age, entered the service of the company in 1940, was educated at Princeton University, Brooklyn Law School and Harvard Law School. Besides serving as secretary for Union Electric Company of Missouri, he is also secretary of the following companies: Union Electric Company of Illinois; Iowa Union Electric Company; Mississippi River Power Company; The St. Louis County Gas Company; the Union Electric Land and Development Company; and the Cupples Station Light, Heat and Power Company.

6918 As secretary, he is in charge of the corporate records of the companies and the records of the boards of directors. He records the minutes of the meetings of stockholders and directors, and performs other functions specifically assigned to him. He is aided by Eugene R. Kropp, assistant secretary.

He is assistant secretary of the same group of companies previously mentioned. He is 40 years of age and has been with the company 17 years, 8 of which are in his present position. He is a native of St. Louis, attended Washington

—2,943—

 6919

University. Mr. Kropp had the title of assistant to the secretary from 1923 to 1932, before becoming assistant secretary.

The treasurer of the Union Electric Group, the same group of companies, is Mr. John L. Ganz. As the chief financial officer of the company, Mr. Ganz, who is 57 years of age, has been, for 20 years, in his present position, and for 34 years associated with the company. He studied mechanical and electrical engineering at the University of Missouri. From 1906 to 1909, Mr. Ganz worked in the drafting office; 6920
from 1909 to 1916, he was shop foreman of the motor department; in 1917, machine foreman; from 1917 to 1920, he acted as attorney; and from 1920 to date, as treasurer.

Mr. Ganz performs the treasurer's duties for the group of companies mentioned, and assists, advises and cooperates with the assistant treasurers in St. Louis County, Missouri, East St. Louis, Illinois, and Keokuk, Iowa.

Chiefly, his functions are to execute all documents and certificates requiring the signature of the treasurer, such as Federal income and capital stock tax returns, certificates required by trustees, etc. 6921

His duties are to open and establish the deposit and distribution of funds, and in general carry on all contacts with banks relating to company funds; to sign or countersign voucher checks and various special accounts checks; to supervise or carry on all correspondence with holders of pre-

ferred stock; to carry on all correspondence with customers involved in intentional or unintentional diversion of electric service; to jointly with the secretary maintain a record of the

contents of the company's safe deposit boxes; appoint and supervise individual merchants as branch pay station agents; supervise the stenographic and mail delivery service to all departments in the main building.

In the performance of these functions, he is assisted by the following division heads and supervisors: the assistant treasurer, who also acts as claim agent; the assistant claim agent; cashier; general clerk; and supervisor of special inspectors.

6923 Assisting the treasurer in the handling of personal injury and property damage claims is Mr. George H. Hartwein. He is 51 years of age, and a native of Missouri. Four of his 14 years of service have been in his present position. From 1926 to 1936, Mr. Hartwein acted as attorney, and from 1936 to date has been assistant treasurer of the Union Electric Company of Missouri, and subsidiary companies, as well as the St. Louis County Gas Company.

His functions include the handling of personal injury and property damage claims, the signing and distribution of general employe pay checks, and the handling of garnish-
6924 ment proceedings.

—2,945—

He also takes care of all employe accident claims relating to employes of the Union Electric Company of Missouri, employed in the city of St. Louis, at Rivermines plant, and at the Osage plant, and also those employes of Union Electric Company of Illinois who work at the Cahokia and Venice plants.

Another one of his duties is the preparation of reports of accidents involving any of the companies' automobiles.

6925

Active in claims work and working with Mr. Hartwein, is Mr. Herbert W. Harbison, Jr. Mr. Harbison is assistant claim agent, 33 years of age, and a St. Louisan. His employment by the company totals 11 years, and his occupancy of his present position—four years. He came with the company in 1929 as intermediate accountant in the accounting department. He served in 1930 as a junior accountant, and from 1930 to 1936, as accountant for the east side properties.

In 1936 he did some work as a valuation accountant before becoming assistant claim agent in that year.

6926

He cooperates with the assistant treasurer, Mr. Hartwein, in the various matters which I have previously listed as under his direction. In addition, he keeps a record of bonds and bond interest coupons outstanding, and cremated, of the Union Electric Company of Missouri, Mississippi River Power Company and the Keokuk Electric Company, which is a predecessor of the present Iowa Union Electric Company.

He also procures certificates of title and licenses for

—2,946—

automobiles, and handles the issuance of the executive payroll checks and keeps records in connection therewith.

6927

The general clerk of the treasury department is Mr. Herbert H. Bindbeutel, who is 35 years old, a St. Louisan, has been with the company for 20 years, and has held his present position for 12 years.

—2,947—

He started with the Union Electric Company as an office boy in 1920, and progressed through the functions of junior clerk and collector, outside messenger, senior assistant book-

6928

keeper, preferred stock bookkeeper, and general clerk, to his present position as supervisor and general clerk.

His principal duties are to obtain signatures on all voucher checks, and certain mail, and to record and report the disbursements thereof for the complete list of companies represented by the Union Electric Group.

He also maintains a dividend list of preferred stockholders. He keeps the common stock register and stock certificate books of the Union Electric Company of Missouri, and
6929 subsidiary companies, and keeps the transfer agents supplied with the necessary information received from shareholders, and prepares and files reports to the Internal Revenue Department on bond ownership, and file State and Federal information on returns for all companies, affiliates and subsidiaries.

The cashier for the company is Michael J. King. We always call him Mike King. He has been with the company ever since anybody can remember. He is now 64 years of age and has worked for the company 46 years, 20 of which have been in his present position.

6930 He was employed by the old Missouri Edison Electric Company at the time of its consolidation. From 1894 to 1908 he held a position in the collection department. During

the years 1908 to 1920, he was assistant cashier, and has been cashier from then until the present time. I have known Mr. King for about 20 some-odd years.

This group, of which he has charge, receives all remittances and payments made to the company from all divisions of the company to which money comes in. He handles

the banking for East St. Louis and transfers accounts from the Alton banks to the St. Louis depositories; also some deposits are made for the Iowa companies in St. Louis.

Minimum bank balances are maintained in St. Louis County, and outlying divisions, and the East St. Louis and Alton division; and the cashier's division handles the transfer accounts to the St. Louis banks. It also handles all city division expense accounts, some for the outlying divisions, and the electric portion of the St. Louis County Gas Company. 6932

I think I can explain that. From what are called the cashier's working funds account—they have an arrangement in St. Louis County wherein customers who have both gas and electric, can pay their bills to either company, I mean you only have to send one envelope, and the company makes the transfer of cash and sends it back. If the electric company receives both the gas and electric bill, they turn over the gas part to the gas company. It saves the customer making two separate remittances, and two postage payments.

—2,949—

Special investigations are handled by a separate group 6933 under the direction of Vernon J. Goodwin, who is 52 years old, and has been with the company 27 years, 4 of which have been in his present position. He served in various capacities, as repairman, 1913; trouble man from 1914 to 1915; clerk from 1915 to 1920; meter installer from 1920 to 1925; and as inspector until 1927; adjuster until 1936; and supervisor of special inspectors since that time.

The special investigations group handles current theft cases, and irregular connections resulting in unmetered service. They make estimates of the amount owed to the com-

6934 *Stanley Stokes—By Respondents—Direct*

pany for unmetered service, and carry on negotiations with customers for the collection of such amounts. They also make confidential investigations of frauds which may be perpetrated against the company.

The president of the company has an assistant, Mr. Walter G. Heren. Mr. Heren functions as special assistant to carry out any instructions the president may have, and upon certain occasions he acts as assistant secretary for the Union Electric Company of Missouri, Union Electric Com-
6935 pany of Illinois, and the Mississippi River Power Company. He is 40 years of age and has lived most of his life in Missouri.

The comptroller of the Union Electric Company of Missouri and the St. Louis County Gas Company, is Mr. Alwin H. Schettler.

He is the chief accounting officer of the company, and

—2,950—

supervises through six department heads, all reporting direct to him, all of the accounting functions and correlated
6936 subjects for Union Electric Company of Missouri, and subsidiary companies, and the St. Louis County Gas Company.

His supervision extends over 347 employees in the following six departments:

General Auditor's Department, Fiscal and Statistical Department; Accounting Department; Valuation Department; Budget Department; and Tax Supervisor's Department.

Mr. Schettler is 40 years old, and has lived his entire life in St. Louis. He is a certified public accountant of St. Louis, received his Bachelor of Science degree in Commerce

at Washington University, and his Master's Degree at Northwestern University.

Prior to his employment with the Union Electric Group, he was a member of the staff of Price Waterhouse & Company for more than 15 years.

The general auditor of the electric company, that is, the Union Electric Company of Missouri, and the St. Louis Gas Company, is Mr. William Avery. His functions are to review currently financial and operating reports. He conducts operating cost studies and periodically scans accounting pro- 6938
cedures in an attempt to obtain a more uniform application of those methods.

—2,352—

Mr. Avery also analyzes various accounts and develops or reviews the bases for allocation of costs or other apportionments for recording in the accounts of the respective companies.

He performs special assignments for the comptroller, which are outside of the scope of ordinary routine of the other accounting departments. Mr. Avery has three assis- 6939
tants, two small groups of auditors totalling 11 employes, called the Internal Audit Group, and the Stores Audit Group. They report to him. He is 51 years old and is a native of Missouri, having been born in St. Louis. He has been with the company for 36 years, 21 of which have been in his present position as general auditor.

The Internal Audit Group is directed primarily to the verification of all balance sheet and income accounts. The Stores Audit Group performs all stores auditing duties for all companies of the group and the St. Louis County Gas Company.

6940 *Stanley Stokes—By Respondents—Direct*

Those are primarily the reconciliation of stock balances, and a general check-up and examination of stores department records and procedure.

The fiscal and statistical auditor of the Union Electric Company of Missouri, and the St. Louis County Gas Company, is Mr. Eugene J. Shapiro, who is 36 years old, has been in service with the group for 15 years, five of which were in his present position. He is a St. Louisan, received a degree

—2,952—

6941 of Master of Bachelor in Commerce at Washington University, and was first employed as valuation clerk in 1926.

There are 15 employes reporting to him or engaged in the following activities: preparation of data required by Federal regulatory bodies, including particularly the Securities Exchange Commission, the Federal Power Commission and the Interstate Commerce Commission; the preparation of data required by two State regulatory bodies, the Public Service Commission of Missouri and the Illinois Commerce Commission; the preparation of information required by the New York Stock Exchange; compliance with requirements of State

6942 and Federal regulatory laws, and with the requirements of trust indentures of all companies; also the preparation of data required in connection with any redemption or maturity of outstanding securities, and the preparation of data for a large number of statistical reports and general questionnaires, including reports to stockholders and various other agencies; preparation of various balance sheets and other financial schedules of the Union Electric Group of companies; the preparation of certain data, complete monthly reports to boards of directors of the Union Electric Company of Missouri, and the St. Louis County Gas Company, and a review

 6943

of data on income and miscellaneous matters to be included in minutes of the meetings of the boards of directors of the various companies.

The operating auditor of the Union Electric Company of

Missouri and the St. Louis County Gas Company is Mr. Everett J. Emberson.

He was first employed by the group of companies in 1920, as junior accountant. The functions of the operating auditor include the supervision of the general accounting division, 6944 the St. Louis City billing division, the St. Louis City credit, adjustment and collection division, and the meter reading division.

General accounting Division operates under Mr. William P. Crowley, assistant operating auditor. He is 39 years of age and has been with the company 24 years, three of which are in his present position. He is a St. Louisan by birth, started with the company as an office boy in 1916.

The general accounting division performs accounting work for the following group of companies, which includes 6945 the entire group of Union Electric Company of Missouri and subsidiaries and affiliated companies—I will not list them.

In addition to the above, the accounting division acts in a supervisory capacity for the accounting department of the Mississippi River Power Company and the Iowa Union Electric Company, and in a consulting capacity for the St. Louis County Gas Company.

The work performed by this division is in general that performed by any other accounting division, and I will merely indicate one or two items. It includes the prepara-

6946 *Stanley Stokes—By Respondents—Direct*

tion and inspection of entries, compiling trial balances, maintaining general ledgers, subsidiary ledgers and other subsidiary records; the preparation of condensed income accounts and balance sheets, and financial and operating reports.

—2,954—

They assist in the preparation of a large group of other data which includes the various schedules for annual reports to the various commissions. Of course, they prepare the
6947 checks for payment of all invoices, reimbursement of all working funds for the companies of the group, with the exception of the Mississippi River Power Company, Iowa Union Electric Company and the St. Louis County Gas Company.

They also maintain the social security records and make reports on those.

In addition to the regular accounting work for the Union Electric Group, they carry on the general books of the Utility Employes Savings & Loan Association. That is an organization similar to any other savings and loan association, except that it is for the Union Electric Group employes.
6948 It has been very successful over many years.

In the billing division Mr. Frank W. Phelps is in charge.

We have pretty well described the functions of the billing division, and the billing and contract accounts group, and I won't go clear through the operations, but he has complete charge of that group of work. He is 38 years old and has been in the service of the company for 18 years, six of which have been in his present position as chief clerk of the billing division.

—2,955—

 6949

He is a Missourian, started with the company in 1922 as junior accountant, and served in various accounting positions in St. Louis and East St. Louis, becoming chief clerk in 1934.

The chief clerk of the credit, adjustment and collection division is Oscar J. Vosbrink. Again we have discussed the operations of the credit and collection division rather extensively, shown how it functioned. There are 68 persons reporting to Mr. Vosbrink in this division, including an adjustment group, a collection and outside adjustment 6950
group, a credit group, a credit and final bill group, a special assignments group, and the last group performs miscellaneous work which is carried on for the chief clerk.

He has occupied his present position for six of the 15 years he has been with the company. He is 38 years of age and a native St. Louisan, and was first employed as utility accountant in 1926. He subsequently filled other accounting positions, until he came to his present position in 1934.

As previously discussed, the billing division is carried on in connection with the collection and credit work, and the foreman of the meter reading division is George P. Zbaren. 6951
He has about 50 people under his supervision, and is charged with obtaining the reading of all electric meters in the city of St. Louis.

—2,956—

Some of his employes form the addressograph group, and maintain that part of the work as well as the meter reading.

—2,957—

He is 52 years old, has been in the employ of the company as meter reader foreman for 23 years.

6952 *Stanley Stokes—By Respondents—Direct*

The valuation auditor is Mr. Harold W. Ross. He has served in this capacity for 5 of the 6 years he has been with the company. He is 51 years of age, a native of Illinois, and presently resides in St. Louis.

Prior to his employment by the Group of companies, he had been chief accountant of the Missouri Public Service Commission for 7 years, and had 17 years valuation and regulatory experience with that Commission, and the Interstate Commerce Commission.

6953 The valuation department, consisting of 30 employees, is directly under his supervision, and includes three groups whose principal functions relate to work orders. Different companies have different names for those, but those are the orders which approve the expenditure for property and plant. He also has under his supervision property accounts, appraisals and valuations—those are the groups.

This department makes contact with State and Federal regulatory authorities in matters pertaining to property accounts, appraisals and valuations. They perform the functions for the Union Electric Group as a whole.

6954 The work order group controls and audits work order expenditures, checks work estimates, and the proper accounting therefor, and maintains a current record of these work

orders. The work order is the source of authority for all expenditures for property and plant. In other words, if I want to put in a sub-station, estimates are drawn up and completed and put on what we call the work order form, and that is submitted to the management for approval. It then goes to the valuation department for various checking, and becomes the authority for the expenditure.

6955

That work order group prepares monthly journal vouchers to record the provisions for current depreciation for all companies except the Mississippi River Power Company, Iowa Union Electric Company, Union Colliery Company, and St. Louis County Gas Company.

In the property accounts group is developed and maintained the continuing property records for all companies except Mississippi River Power Company, Iowa Union Electric Company, Union Colliery Company, St. Louis & Belleville Electric Railway Company, and St. Louis & Alton Rail- 6956
way Company. These companies at present do not have continuing detailed property records.

This group analyzes and verifies the accounting for all plant expenditures and retirements, and makes the necessary analyses for proper capitalization of general construction overhead.

Plant expenditures and retirements are summarized by established property units and are currently recorded in a

—2,959—

continuing property record, which is kept in balance by summarization into the plant accounts, prescribed by regulatory 6957
authorities. You understand what I mean by continuing property records? That is, they keep a record of every item that is added to the property and plant, in detail, both as to the physical property and valuation, and remove and keep a record of removals of all the property withdrawn.

Among other things, this group develops and maintains physical property statistics which are used as the basis for reports to regulatory authorities, and for many other purposes. It also makes depreciation studies and assists in making appraisals.

6958 *Stanley Stokes—By Respondents—Direct*

The property accounts group has been engaged in the determination of original cost of physical property as required by Federal and State authorities, and in the reclassification thereof into prescribed accounts. All schedules and data required by regulatory authorities have been prepared and filed, and the necessary entries to record the various classifications are in the process of preparation.

The appraisals and valuations group makes all appraisals of property. At the present time this group is engaged in
6959 an appraisal of the property of the St. Louis County Gas Company, in accordance with an order of the Missouri Public Service Commission.

The next division to be discussed is the budget depart-
—2,960—
ment, of which the head is the budget auditor, Mr. Arthur P. Lucchesi. I have known him for many years or I wouldn't be able to pronounce that word.

He is 44 years old and has been with the company for 27 years, 5 of which have been in his present position as budget auditor.

6960 He has had various positions. He was employed in the billings department in 1913, and has held many positions in the accounting department and in the billing division before becoming assistant general auditor in 1922, and budget auditor in 1936.

The functions of the Budget Department, which includes 7 other employees, consists of the preparation of operating estimates, summarization of and the maintaining of control records for construction and retirement budget; summarization, coordination and the maintaining of control records

for the operating and payroll budget; and the preparation of cash budget requirements, as well as other cash estimates.

The tax supervisor's department is headed by Mr. Walter S. Alt, with a title of tax supervisor. His work is for the Union Electric Company of Missouri and subsidiaries, and the St. Louis County Gas Company.

He is 49 years of age, and an attorney, and for the last 18 years prior to his employment in this Group, had been connected with the Bureau of Internal Revenue, the last 6

—2,961— 6962

years as a member of the Bureau's technical staff.

His department consists of 8 employees, and he is charged with the duty of preparing all Federal, State and local tax returns, with the exception of real estate and personal property tax, city of St. Louis merchants' and manufacturers' license tax, Missouri, Illinois and Iowa annual reports, and Missouri franchise tax returns.

As an example of the types of returns which are required —I won't attempt to list them all—but they are all under his supervision. We have, under "Federal": income tax, capital stock tax, electrical energy tax, admissions tax—— 6963

Q. (Interposing) I don't think you need to go through that. A. All right, that is just a percentage of them.

That department has some other routine duties in addition to their tax return work, all having to do with tax records in one form or another.

The next gentleman under discussion is myself. I have already qualified, and I don't know as any further discussion of my position is necessary.

My department is a small group of highly technical engineers with Mr. Harold Gove as my assistant. He is 35

years of age and has been in the employ of the company for 11 years. He is a native Missourian and graduated from Missouri University in 1929, with the degree of Bachelor of Science in Electrical Engineering.

—2,962—

Subsequently, he obtained his Master's Degree in mathematics from Washington University in 1935. We permitted Mr. Gove to do some outside study in connection with his regular work because he was very proficient in mathematics,
6965 and we needed an engineer-mathematician. We found that a straight mathematician lacks too much knowledge about the practical application of the work, and altogether Mr. Gove has been sent to school off and on for approximately 8 years to study special mathematical application. It has been very helpful in our work.

He now makes all the transmission line calculations, stability studies, and things of that kind, as well as functioning as a general assistant.

—2,963—

The director of industrial relations is Mr. W. D. Alder-
6966 son. The industrial relations department is responsible for employe relations activities, and we have in the group of companies an organization known as the Employes Mutual Benefit Association, which represents the employes in all of their dealings with the company, and as a part of that association activity, they have many types of benefits, such as doctors' services, dental services, employes' recreation clubs, and other related matters.

Mr. Alderson has charge of those activities. He is 59 years of age, has been in the employ of the company for 30

years, and in charge of the present type of work for 21 years. He is a native Missourian, has lived in St. Louis and St. Louis County all his life.

He has 23 permanent employes under his direction. In the summer months we operate an employes' club, and there are 23 more employes out there that report to Mr. Alderson when the club is in operation. His assistant, Mr. M. B. Mathis, is 39 years of age, has been in the employ of the company since 1922. He was first employed as secretarial clerk in the secretary's office, and has been assistant to Mr. 6968
Alderson for the past 17 years.

The employment division comes under the industrial relations department and takes applications for employment, interviews applicants and selects new employes. All requests

—2,964—

for employes on the part of the company divisions come through this department. They maintain all employe records for the system, supervise the application of the wage schedule and salary adjustments for employes which are on what we call scheduled rates.

They report authorized payroll information to the various 6969
departments, and to the payroll division of the accounting department.

The medical division—of the industrial relations department is maintained at all times and embraces a medical office and district physician's services. A regular practicing physician is on duty in the medical office, one doctor in the morning an one in the afternoon, for examining new employees and for handling emergency cases in or near the building.

A nurse is on duty throughout the day. There are 24 regular practicing physicians in various districts throughout

6970 *Stanley Stokes—By Respondents—Direct*

the St. Louis area, who provide ordinary medical service for employes and their immediate dependents. There are also four specialists on eye, ear, nose and throat disorders.

The industrial relations department maintains a service of this kind and sees to it that the employes get this service at reduced rates, or in many cases at no charge.

A similar type of operation applies to the dental division which also has offices in the main building, and includes one

—2267—

6971 dentist available all day, and an additional dentist in the afternoon. And the dentists have an assistant at all times.

Mr. Alderson supervises the safety program wherever contracts with the Employes' Mutual Benefit Association are in effect, except in the Keokuk district. This work is carried on through a central safety committee made up of employes from the various districts. There is also a safety coordinating committee which serves as a medium of obtaining action in the correction of hazards.

Most of the recreational activities throughout the company are cleared through Mr. Alderson's department.

6972 The general superintendent of electrical operations is Mr. George K. Miltenberger. He is directly responsible for operation of electrical power producing and transmitting facilities of the Union Electric Group. The following departments are under his supervision: Construction Department; Electrical Distribution; Electric Power Plants; Hydraulic Engineering—the Hydraulic Engineering Department is actually engaged in direct operating work, the name is somewhat misleading, but it carries on engineering work in hydraulic matters and operating work as well.

6973

The Osage Power Plant operating group reports to Mr. Miltenberger, the steam heating, stores and transmission department also.

He is 51 years of age, and has had 25 years of service

—2,966—

with the company, 10 in his present position. He is a graduate mechanical engineer of Cornell University, and began work as power salesman in 1916. He is a native of St. Louis.

As assistant to Mr. Miltenberger is Mr. George P. Gamble. Mr Gamble is 41 years of age, has been with the company 6974
9 years, 5 of which has been in his present position.

Prior to his connection with the company, he was employed by Stone & Webster Engineering Corporation for a number of years on both construction and engineering work. He received his engineering degree from the University of Virginia, is a native of Richmond, Virginia. He acts as direct assistant to Mr. Miltenberger on any assignments.

A small construction group reports to the general superintendent of electrical operations—that is Mr. Miltenberger. The chief of this small group of construction people is Mr. Edward A. Rudulph, who is 45 years old, and had 9 years 6975
of service, in his present position. He is a native of Bowling Green, Ohio, and graduated with a degree in Civil Engineering from Rensselaer Polytechnic Institute.

Previously he was associated for a number of years with the Stone & Webster Engineering Corporation. He came with the Union Electric Group as assistant engineer in 1932, and now has the title of design engineer, and has had it since 1936.

The superintendent of electrical distribution is Mr. Chris

—2,967—

6976 *Stanley Stokes—By Respondents—Direct*

H. Kraft. His department, which consists of 365 employes, is engaged in the engineering, construction and operation of electrical distribution system. This does not include the operation of the sub-stations themselves, which are under the power plant and sub-station division, which report to the preceding gentleman, Mr. Miitenberger.

We have already described the distribution department in some detail, and since it represents about 25 per cent. of the investment in the company's properties, its is obviously an
6977 extensive part of the system.

Mr. Kraft is 49 years old, a native of Missouri, has been with the company for 25 years, 15 in his present position.

I was instrumental in getting Mr. Kraft his job with the company. He was first employed as assistant in the general manager's office in the St. Louis County Division. He then worked as an operating engineer and as a superintendent of distribution. In 1920 he became distribution engineer with the St. Louis City Division, and then electrical engineer, and then assistant superintendent of electrical distribution, and finally his present position as superintendent of electrical dis-
6978 tribution for the City Division. He is a graduate of Missouri University.

The chief clerk in the distribution department under Mr. Kraft is Mr. Fred W. Blanche. The clerical division of the distribution department keeps the records and does all of

the office work for the entire department, maintains a daily record of the activities of the various construction crews, prepares estimates of the cost of construction and maintenance

work, has charge of the customer card records, and many other operations, some of which have been described.

—2,969—

The supervision of the company's branch telephone exchanges is under Mr. Blanche's direction. He is 46 years of age, a native of St. Louis, has been with the company for 29 years, 14 of which have been in the position he now holds.

He went through the various jobs of drafting clerk, draftsman, chief record draftsman, engineering clerk, junior distribution engineer, and assistant distribution engineer, 6980 and then his present work.

You see, in a department of that kind, records are not only matters of typewritten form, but they also include a large group of charts and maps, load density maps, and records of pole lines on streets, and the record work there is a combination of map work as well as ordinary bookkeeping.

The operating superintendent in this division is Mr. Rollo C. Morris. You see the distribution division is divided into two basic parts, the construction and the operation. Morris is in charge of the operating part.

Under him are three major groups which may be described 6981 as operating engineering, emergency trouble dispatching, and emergency field force.

There are some minor groups representing appliance repairs and other features under him. Mr. Morris is 49 years of age, a native Missourian and has been with the company 20 years, 15 years of which have been in his present position.

I have very frequent contacts with Mr. Morris in connection with developmental work in the distribution depart-

—2,970—

6982 *Stanley Stokes—By Respondents—Direct*

ment, and find him very able. His first position was that of junior electrical engineer, since which he has had various positions as junior assistant distribution engineer, senior assistant distribution engineer, assistant distribution engineer, and his present position. He graduated from the Missouri University, with the degree of Bachelor of Science in Electrical Engineering.

I happened to be an assistant in physics there one year, and Mr. Morris was one of my students in physics laboratory
6983 work.

The chief draftsman in charge of the records division is Edward H. Geers. He has two groups of employees, one the permit group, that have all things to do with city permits for construction work, correspondence with other companies relative to exchange of pole space, pole records, right-of-way easements, agreements, and so forth; and a drafting group, which handles and maintains the plat record of the overhead and underground systems.

He is 46 years of age, and has been with the company
6984 for 25 years, 15 of which have been in his present position.

He is a native St. Louisan, first employed as filing clerk, and then as plant draftsman, record draftsman, chief record draftsman, and now in his present position in charge of the records division.

—2,971—

The engineering subdivision of the distribution department is under the direction of Mr. Roland A. Lea. This group is responsible for the preparation of detailed plans and estimates of construction, reconstruction, extension and maintenance of distribution systems.

Mr. Lea is 51 years of age, a native of Kansas, and has been with the company for 28 years, fourteen of which have been in his present position.

He has held various positions as station meter tester, engineering clerk, assistant distribution engineer, and distribution engineer.

He graduated from the University of Arkansas with the degree of Bachelor of Science in Electrical Engineering.

The installation division is operated under the direction of Mr. John E. Weis. They have general charge of the meter 6986
installations, removals and miscellaneous installation work.

Mr. Weis is 61 years old, a native of St. Louis, has been with the company for 36 years, 21 in his present position.

His first job was meter man, and then as special estimator and installer.

In the operation of the distribution department, it is divided into two geographical divisions, with Mr. George C. McLaughlin in charge of the north district. He is 60

—2,972—

years of age, a native St. Louisan, and has been with the company for 44 years, 8 of which have been in his present 6987
position. He was first employed as a ground man and worked through various positions up to his present position of superintendent in charge of the north district.

In similar work, Mr. Fred A. Silvers is superintendent of the south district. He is 53 years of age, a native Missourian, has been in the company's employ 25 years, of which 11 have been in his present position. He has also had a number of jobs, always in the same kind of work.

The underground conduit division is in charge of Mr. James L. Coughlin. He supervises three crews of 14 men

each, whose work includes excavation and installation of underground conduits, transformer vaults, manholes, and service laterals.

They also cooperate with the steam-heating department and install steam mains and steam service laterals.

He is 50 years of age, a native of St. Louis, has lived in St. Louis all his life. He has been with the company for 37 years, 5 of which are in his present position.

He had a number of other positions starting in as cable
6989 man, and working through foreman and other jobs until he got his present position as superintendent of the conduit division.

The superintendent of the cable division is Mr. William

—2,973—

H. Burggraf. Similar to the underground conduit division, they install cables throughout the city, including the submarine cables to Cahokia and Venice plants in Illinois. They also install all the service laterals to customers' premises, and make cable repairs and handle cable failures.

He is 58 years of age, a native St. Louisan, and has been
6990 with the company 34 years, 4 years in his present position.

He was first employed as a cable man, and then became a splicer's helper, then crew foreman and assistant underground superintendent, before obtaining his present position.

The superintendent of electric power plants is Mr. Charles C. Robinson. He is 60 years of age and has been with the company for 29 years. His first employment was with the Mississippi River Power Distributing Company, a predecessor company, on construction work. As a matter of fact, it

had to do with the construction of the Page Avenue sub-station.

He has had various positions, as superintendent of sub-stations, superintendent of power and transmission department, superintendent and load dispatcher, assistant electrical engineer, superintendent of electric power plants,—which position he now holds.

He graduated from the University of Missouri and has a degree of bachelor of science in electrical engineering.

—2,974— 6992

He is responsible for the electrical operation in all the power plants, and the major transmission sub-stations, and the chief load dispatcher reports to him.

The testing and calibration of watt-hour meters in the St. Louis City Division is under the meter department, the head of which reports to Mr. Robinson. There are 334 employes in his division.

The superintendent of sub-stations, who is Mr. Robinson's direct assistant, is Mr. Oscar J. Rotty. Mr. Rotty is 42 years of age, a graduate of Missouri University, with the degree of Bachelor of Science in Electrical Engineering, 6993 and entered the service of the company 19 years ago. He has had quite a succession of positions, starting in with graduate engineer, and is now superintendent of sub-stations. "Graduate engineer" there means that he just graduated from college; it doesn't mean that that is the top job.

Mr. Rotty has charge of the operation and maintenance of all the distribution sub-stations within the city limits of the city of St. Louis, as well as the Page Avenue station, which is located just outside the city limits in St. Louis

6994 *Stanley Stokes—By Respondents—Direct*

County. He acts as assistant superintendent in the absence of Mr. Robinson. He also does some construction work.

The supeerintendent of the major power plant at Cahokia, whose job is known as electrical superintendent, is Mr. Harry O. Duetscher. He is 42 years of age, employed for 23 years, and is a native of St. Charles, Missouri. He has had

—2,975—

most all the jobs in the electrical installation work, starting with wireman's helper in 1917, thence wireman, foreman, sub-
6995 station division electrical superintendent—which he now holds.

He is responsible for the operation and maintenance of all electrical equipment at the Cahokia and Venice power plants, with 84 men under his supervision.

The meter department, which I just mentioned, is under the direction of William L. Hunker. They handle the meters for the City Division. He is 57 years of age, has been employed by the company 32 years, 25 of which have been in his present position. He was meter tester to begin with. He graduated from Missouri University. He has charge
6996 of testing and adjustment of all customers' meters, and a major portion of the meters used for recording and controlling system operations. He also has charge of the laboratory where standards and other instruments are calibrated.

He also does testing of various kinds, all the way from safety devices up to testing an electric range.

The chief load dispatcher is Mr. Oliver L. Luft. He was born in St. Louis 46 years ago, and has served the company 26 years, beginning as an oiler, and then an operator in sub stations, and then an operator at Cahokia, then a fore-

6997

man, general foreman, and since 1935, from 1935 to date, he has been chief load dispatcher. Mr. Luft, and the load dispatchers whom he supervises, collect the data used in fore-

—2,976—

casting load conditions, coordinate electric generation of steam and hydro plants in the whole system, and are responsible for switching operations on the transmission lines delivering energy to the sub-stations.

The electrical superintendent in charge of the Ashley Street power plant is Edward S. Murdock. The old gentleman is 77 years of age, has been with the company for 47 years. Part of this time he was with the Missouri Edison Company, prior to its consolidation. Mr. Murdock is a very interesting man and you would never suspect that he was anything like that age, and he is such a thorough operator that the service which he is able to provide from the Ashley Street station is comparable with the service which is obtained from some of the newer plants, approximately. He is the most remarkable man. He won't be with us much longer because he is about to be retired on a pension basis, but the company will miss him.

6998

6999

The Examiner: We will take a short recess.

(Whereupon, a short recess was taken.)

The Examiner: Let us resume.

A. (continued): The chief hydraulic engineer for the Union Electric Group is Mr. Albion Davis. He is responsible for the efficient use of hydro generation on the system which I have described at some length heretofore. He is 49 years of

7000 *Stanley Stokes—By Respondents—Direct*

age and went to work first as an engineer at the Keokuk plant in 1914, when it was being constructed.

—2,977—

He is a college graduate.

Three engineers report to Mr. Davis in the St. Louis office, and two engineers, one at each hydro plant, work in conjunction with him in handling the hydraulic operating schedules. His department also cooperates with the governmental agencies in the collection of current hydrologic data, main-
7001 tains rainfall and river gauging stations, prepares forecasts of river flow and power available, which are sent to the load dispatching office.

Daily, weekly and monthly the forecasts of hydro power are prepared in advance for the benefit of the steam plant operations and the scheduling of load.

The hydraulic department is pretty much of a self-contained division in our company, and where there is any special type of maintenance such as examination of turbine runner for pitting or any repair work of major proportions,
7002 Mr. Davis is always called in, in connection with that work.

The superintendent of the Osage plant is Mr. Turner White, Jr. Mr. White is 46 years of age, has been with the company for 10 years, 9 in his present position. He has 40 employes reporting to him in the operation of the Osage station.

The steam heating department is under the supervision of Mr. J. E. Hillemeyer. He also operates the little Cupples station of the light, heat and power company group, because

—2,978—

7003

it is essentially a steam operation. He has 38 employes reporting to him.

——2,979—

He is 59 years of age, and has been 30 years with the company, 14 of which have been in his present position as manager of the steam heating department.

His first position was in the St Louis County division as engineer, in 1910.

The general storekeeper for the company is Mr. Robert S. King. He is in charge of the main storeroom, and all of 7004
the sub-storerooms, and that includes the delivery of material and operating a fleet of trucks, and he also is in charge of the utility shop.

The name "general storekeeper" is a little misleading for Mr. King, although that is exactly what he does. Still, the position is more responsible than the name would indicate, and he has one of the major jobs with the company.

He has 109 stores employees reporting to him, and 71 shop employees. He is 46 years old and has been with the company for 29 years, 21 in his present position. He started as a clerk in the sales department. 7005

He has 5 assistant general storekeepers, as well as a superintendent of the shop, under his supervision.

Mr. Tillman, Francis A. Tillman, has general charge the shop, and that includes under that the salvage operations where they recover the wire and material from the cable and salvage as much of the material as possible.

Mr. George W. Couch is superintendent of transmission.

—2,980—

He has charge of the operation of the major transmission

lines in the St. Louis district, including the main Osage circuits and other high voltage lines.

He has 22 permanent employees. He also has charge of the operation of the Rivermines sub-station and the electrical operation of the Rivermines power plant.

In the summer months, of course, he increases his force materially and does extra work, and frequently runs his group up by 55 or 60 men during such period. His first job was that of a sub-station helper in 1913. He is 47 years of
7007 age and has been with the company 27 years.

Mr. Couch was reporting directly to me for a number of years as superintendent of the Franklin County division, in which he at that time had certain responsibilities, quite different from his present work. But he has been very successful in everything he has attempted.

The rate department is under the direction of Leslie V. Nelson. Their job is to study and analyze rates and correlate the rates with the cost of service, and analyze the various classes of rates.

Surveys are conducted with the purpose of standardizing
7008 all contracts for supplying electric energy in similar classes of service.

He has 6 employees in the rate division. Mr. Nelson is 45 years of age, has been in the employ of the company

for 15 years. His first position was as power supervision engineer in 1926, at which he reported to me.

The real estate and tax officer for the system is Mr. Harry C. Williamson. He represents the real estate and tax matters for Union Electric Company of Missouri and subsidiary companies, and St. Louis County Gas Company.

 7009

He is 39 years of age, and began his service with the Union Electric Group as a tax clerk in the real estate and tax department in 1931. He became assistant real estate and tax officer in 1934, and his present position is that of real estate and tax officer for the group.

He has charge of the administration of all real estate and personal property, corporate, franchise and other forms of taxes, including the local improvement and license taxes. He files the tax returns and checks the payments on approxi-
mately 4,400 tax bills on property located in many separate 7010
political subdivisions.

He also has charge of the superintendents of the non-operating properties, such as the 12-story Insurance Exchange Building which is adjacent to our office building.

He has a personnel of 16 employees looking after that type of work.

He has 9 employees in his own department directly engaged on tax matters, and real estate matters.

One of his men obtains the right-of-way for the trans-
—2,982— 7011
mission lines, and that sort of work.

The research engineer for the company in the research department is Mr. R. Banks McDonald. He is 36 years of age and has been with the company 13 years, and has had his present position for 2 years.

He graduated from Washington University in St. Louis, attended the Harvard School of Business Administration for a year. His first position with the company was tabulator in 1928.

There are 11 employees in the research division under his direct supervision, and they make special studies on particular assignments, mostly of a business or economic nature, and conduct some general studies of a more or less routine nature.

In addition, Mr. McDonald acts as representative for the management, from time to time, in a discussion of labor matters with representatives of the Employees Mutual Benefit Association. He sits as one of the two representatives
7013 representing management on the Board of Adjustment, which is composed of these two representatives, and three representatives representing the employees, which is the Employees Mutual Benefit Association.

In other words, the Association has three representatives and the company has two, and they have a board of adjustment which hears matters with regard to wage changes and complaints.

—2,983—

If an employee feels that he is not either properly treated with respect to his working hours, or conditions, he reports
7014 it to this group, and they have a conference and decide the question.

Mr. Charles E. Michel is the vice president in charge of sales, and is acting as the general sales manager, and has complete charge of all sales activity. There are 215 employees engaged in that work, including industrial power sales in St. Louis County, and the outlying Missouri territory.

Mr. Michel acts in a consulting capacity to coordinate the sales activities of the entire system, although the direct

 7015

sales work in St. Louis County is not under his supervision, but he sends special engineers into the County for particular work on request.

He is 65 years old, and has been with the company for 34 years, 5 of which have been in his present position.

He has lived in St. Louis all his life. He entered the service of the company in 1907 as manager of the automobile department. At that time they were beginning to try to push the electric automobile, and it was kind of an uphill job, it didn't work out so very well. But he was very active 7016
in the work.

He then became the manager of the appliance department, which he carried on and gradually developed up through the various sales positions to his present position.

—2,984—

He acted temporarily in a sales capacity for the Milwaukee Company for a while during the period from 1918 to 1923.

The sales manager reporting to Mr. Michel is Warren L. Berry. Mr. Berry is directly responsible for and supervises the following divisions of the sales department, each 7017
of which is an independent group and has a number of employees: Industrial Sales; Commercial Sales; Residential Sales; Merchandising; Outside Appliance Work; Rural Service; Industrial and Commercial Lighting; Industrial Heating; Commercial Cooking; Air-Conditioning; Isolated Plants —and by that I mean the division of the sales group who are assigned to try to sell electric service to any plants that are still in operation independently.

Continuing:—Rate and Statistical Work. That is a joint activity. The rate department makes the general rate

and inspectors; a number of draftsmen; 77 clerical employees; 165 foremen, along with all the other classes of linemen, splicers, trouble men, wire men, meter men, meter testers, and other skilled employees—the group totalling up to 894.

Q. Do you have equipment specially suited for work on the distribution system? A. We do. In the previous testimony I have described our general transportation system as to number of trucks and so on, and here I will briefly mention two or three pieces of equipment of particular interest.

In order to lower the network transformers into their vaults, we designed and constructed a 10-ton truck crane which can be swung around with a boom sufficiently long to extend out over the sidewalk and yet be able to handle a large network transformer unit.

The customary types of road-breaking equipment, air compressors, drills and so forth, are in continuous use and we have a number of the mobile type air compressors which not only are economical, but do the work with more rapidity and do a better job.

Tractors with power winches are used for pulling cable and similar items.

Trenching machines are available from one of our groups, which can be obtained on a moment's notice.

The other transportation equipment is passenger cars

—2,820—

and ordinary trucks which I have mentioned heretofore.

During unusual emergencies we have been able, in one or two instances, particularly the tornado which has been described, to obtain additional equipment on very short notice. Several contracting firms worked very closely with the vari-

ous companies in our group, and they have a large amount of equipment which is readily available.

Q. Can you give us some statistics to show the extent of the distribution system as so operated? A. Yes, I have previously described the sub-transmission system and I did mention some miles of single wire. At this time, I should like to point out that there are over 10,000 circuit miles of overhead distribution circuits of all voltages in operation on 147,116 poles, plus joint service on over 100,000 poles of other pole using companies. By that I mean where we are joint 6614 with them, they likewise have other poles where they have circuits on ours. Primarily, of course, that is the telephone companies.

These data, or these circuit miles, are in addition to the underground cable and other facilities previously described, although in this 10,000 circuit miles would be included some of that wire which was mentioned only as a single item heretofore.

Over 24,000 transformers of all types, with a combined total capacity of 462,500 k. v. a., are in use.

—2,821— 6615

Many of our major industrial customers own their own transformers, and others occasionally buy power from us, metered on the high voltage side of the transformers at what is usually referred to as primary voltage.

Q. Do your maintenance and operating practices take weather conditions into account? A. They have to pay very close attention to weather conditions and be guided accordingly. The lightning and particularly sleet, wind, rain and temperature, are all factors which have to be considered in

the organization and in the equipment. None of these approach calamity proportions except on rare occasions, and those I believe have been sufficiently covered in other discussions.

Q. In times of calamity do you concentrate your forces as a group? A. We do. I mentioned previously that in the case of a large sleet storm that we had stopped a construction job and transferred over 150 men from one point alone, and I believe that although this distribution system is separate
6617 and distinct from the other one, the sleet storm has a similar effect, and I think we covered it rather extensively and I will simply say that the same situation which existed with respect to our sub-transmission overhead circuits, also applies to many of our distribution circuits, and in the sleet storm of 1924, we had a very serious situation to cope with. It occurred just about a week before Christmas due to a little

warm weather that stayed for several days right around the freezing point, and it begun to drizzle. This word "sleet" is not technically correct for what we are talking about.
6618 The correct term is glaze. The sleet never reaches any proportions to bother with, but when it rains a week with a steady drizzle, and the temperature is about 1 degree below freezing, and then the ice forms on the wires and we have icicles from 18 to 24 inches long hanging every 4 inches on a wire, when you weigh that up, the weight is a good deal per foot of wire.

In cases where the poles were so strongly guyed up that they couldn't break off at the base, some of them would break off 6 or 8 feet from the top.

But under those conditions it is surprising how quickly service is resumed, and the general information that we have received from our customers and their comments are nearly always commendatory with respect to the efforts that we make, and the ability to restore service as quickly as we did.

When we realize that those things only occur on the average once every 18 or 20 years, it is impossible to do better than attempt to repair them quickly.

Q. Do you have the problem of tree trimming? A. Tree trimming is in my opinion, when properly regarded, more 6620
of a social problem than a technical one.

One of the best ways to create good will in any district is to be sure that your tree trimming crews are highly pro-

—2,823—

ficient foresters and if you haven't any men of your own like that, you had better hire the work done. We do both. In some of our divisions we hire the professional foresters on a contract basis, to do our tree trimming. In other divisions we have hired men who have—who are foresters, and have been engaged in that work and have developed our own forestry crews. In either event, we do regular tree trimming 6621
and in the residential and populated areas we use the greatest care in trimming the trees, as they should be trimmed, and not just to suit our wires.

While the men are on the job I don't mind mentioning that if a customer, whose trees are being trimmed in the rear or front of his house, has another tree or so that needs a little touching up, we reciprocate, we trim that tree for him. We have to go into his yard and trim his tree to clear our service wires, and if we can trim another one for him at the same time, we are glad to do it occasionally. It pays its way in

good will. That isn't the viewpoint that was always used in these companies. I have seen trees trimmed otherwise many years ago. But I believe it is essential to get premission from these people to trim their trees. You do, in many cases, have a perfect right to go in and trim them, but it isn't always diplomatic to exercise your rights in that way, and that is one point in which our company has gone to great length, and we have had meetings on it, and we have had comparisons with some of our sister companies and I believe it is

6623 —2,824—

the general viewpoint throughout the group now that you have got to recognize other people's rights and act accordingly, and if you are going to trim trees, do it like a gentleman.

Q. Have you any statistics to show the extent of the construction, maintenance and operating activities of the distribution and distribution sub-station department? A. I do, I have some figures to illustrate in general the magnitude of the work. I do not know just what other use can be made of them, but they illustrate about the size of the system.

6624 The 1939 distribution construction expenditures were as follows: St. Louis City—$1,907,000, (I am reading the nearest round figure); St. Louis County and outlying districts—$1,185,000; Illinois—$489,000; Iowa—$133,000.

I mentioned heretofore that we are in the early stages of some distribution and construction changes in the one city of Ft. Madison, which will cost us nearly $400,000, but that figure will show next year.

The operating and maintenance expense for the city division was $906,000; the St. Louis County and outlying districts—$490,000; Illinois—$294,000, and Iowa—$75,000.

 6625

The total distribution investment as of January 1, 1940, which is intended to be given here only approximately, but which is actually taken from our books as the property and

—2,825—

plant record, is $34,390,000 for the city; $14,895,000 for the St. Louis County and outlying plants; and $6,195,000 for Illinois; and $1,318,000 for Iowa. That is for the 12 months' period ending December 31, 1939. It includes the distribution sub-stations which, in the city and St. Louis County are under the jurisdiction of the electrical power plants depart- 6626
ment. That is, I have grouped in those figures the distribution poles, wire and distribution sub-stations.

Q. Do you have any regulations or installations on customers' premises to provide for service? A. Yes, we have provisions which are known as service entrance regulations, and which provide a guide to the customers and to the wiring contractors, so that the service entrance facilities are of uniformly high standard, simple in construction, and adequately protected.

By "service entrance" I mean the method and the location and the materials which are to be used in bringing the service 6627
into the customer's building, and the cost of which is to a large extent borne by the customer.

We bring our wires up to the building and down to the meter, if it is one of the new sequence installations which are usually out of doors or in the old type installation our wires go into the service switch, which is inside the building wall, and from there on the customer has charge and owns the equipment.

—2,826—

The so-called new sequence metering is now standard throughout the system, and I don't mean to say by that that I believe that every meter on the system is connected that way. I do not think they are, and the facts are that as fast as our meter men get around, we are changing the older installations, but the majority of them have been already cut over.

This sequence metering is of no particular instance, it is simply a revision of the older method by which they used
6629 to put the entrance switch ahead of the meter and then a meter, and then a bunch of fuse wires. Today, in the modern installation, the meter is usually placed out of doors in a case, and by "case" I mean the weatherproof protection that goes over and surrounds the meter. That type of meter is designed to plug in with a bayonet type of fitting and it can be removed quickly. The whole equipment is made weatherproof, and it also has advantages because it is practically theftproof.

So that that is the present standard of meter installation. It has many advantages, it eliminates the annoyance
6630 from meter readers going into the residence and saves us the trouble of making re-reads when the customer is not at home.

If we have to locate the meters in indoors, we are paying particular attention to accessibility and the place where we locate them.

—2,827—

Our larger light and power customers are served in whatever manner suits them, and their requirements. Some of them own their own installations, and in many of those cases they have made contracts with us to maintain and operate their sub-stations for them, that is treat the oil, see

that everything is in condition, and that it is kept in the best possible shape.

We make a charge for that service, although we make a certain type of inspection service for these customers without charge. Many of those installations for the smaller power customers have been designed and constructed without any charge to the customer. It is simply a matter of good business to aid the customer in using our service and in selecting it, and what is quite a major undertaking for him,—he gets some kind of an engineer to design and lay 6632
out these things—it is a very simple and inexpensive thing for us to do, and we have helped the customer out on many of those installations.

Primary metering, which is metering on the high voltage side of a customer's transformer, is used whenever the customer wants to have several classes of service. That is, he may want commercial lighting or some other kind of lighting, and power service, all off of one transformer bank. For simplification then, we simply put the meter on the high voltage side, and he does what he likes with the energy, and it permits us to have one contract for the one installa- 6633
tion.

In the City of St. Louis, customers are supplied from

—2,828—

either the direct current system or the downtown A. C. network, in which the service facilities furnished include a junction box at a point where the underground service enters the building.

As previously stated,—and I believe made quite clear—the additional service in all the newer business is being taken on the low voltage A. C. network.

6634 *Stanley Stokes—By Respondents—Direct*

Q. What do the office divisions of the distribution department do? A. Well, I went into that a little bit in previous testimony here, in which I pointed out that one of the necessary features of successful operation is to constantly study your system load growth trends and other features.

The distribution engineers, estimators and inspectors have to constantly keep in touch with the growing load and be sure that their facilities are kept up, and in such capacity
6635 to suit the load. Furthermore, they have to plan extensions into new subdivisions, and see that the new customers and the additional load requirements of existing customers, are properly taken care of.

In addition to that, the system expansion to provide for the additional load, ranges sometimes from merely a reinforcement of minor sections of a line, to a major undertaking which requires the construction of a new sub-station. Without going into a lot of detail about the various sizes, a sub-station such as I have in mind will run from a minimum

—2,829—

6636 of $150,000 up to about $300,000, and usually starts out with two—12,000 k. v. a. transformers.

I mentioned previously the cooperation between ourselves and the city with respect to civic improvements, and the clearing of streets, and that was mentioned with respect to our subtransmission system, but it applies equally to our distribution system. I pointed out how many miles of circuit we cleared in the street each year, and I won't repeat that.

6637

There is one feature that is of importance in the minimizing of total expense, and that is to see that the Bell Telephone requirements and ours are met with a minimum total cost, and we do that by constant cooperative planning with respect to the joint use of poles.

The records, in a system of this kind, are a matter of importance, and a voluminous matter. Records of all departments on plats, diagrams and so forth have to be kept up. We have got to have plats to show where all of our transformers are, we have got to have transformer record cards 6638
of each transformer, showing the date installed, every time it has been removed or repaired, and the whole history of it. We have got to have records of every pole and records of all of the permits that are granted for installations of all kinds. The record system is a matter of great importance. That is one thing that I have always been a little bit concerned

—2,830—

about, the safe preservation of such records. They are so voluminous and they are in constant use all the time that there is no way to put them in a vault like you would a docu- 6639
ment, and if we were to have a severe fire it would be a great handicap. Of course, we would keep the service going, but we ourselves would lose a lot of valuable records.

An office division under a chief clerk carries out the various clerical functions, briefly payrolls, material manifests for handling material, records of customers' meters, and many other features.

I think that is sufficient to get an idea of the extent of the records and other office work.

Q. Now, will you describe for us your organization to take care of servicing of customers and breakdowns? A. The servicing of customers' premises at any hour of the day and night, as far as that is concerned, is a function of the operating division of the distribution department which we refer to as the trouble division. It also performs tests, inspections, and patrols of a certain type. It does not do the routine type of patrol that we have discussed previously, but does make special inspections.

6641 The trouble department, which is a rather extensive group, is assisted by the construction division whenever the magnitude of the specialized nature of the work requires it.

In St. Louis County, similar functions are performed, but with slight variations. There is no important difference

except that they combine their activities out there in a way to give the minimum total cost. The outlying communities in the suburban districts and surrounding counties have emergency trouble service located at the most strategic point, and where the roads are most accessible.

6642 The Illinois operations and the Iowa operations, and so on, are similar. The trouble service itself is arranged to provide for emergency service, 24 hours a day, and requires 28 first class trouble men and supervisors who are experienced and qualified to handle that class of work on either overhead or underground lines of any voltage, or to do work on a customer's premises.

Six third class trouble men respond to house service calls and are in training for higher grades of trouble work. That is, we start the younger men in on the simple work of calling on the house calls.

During 1939 there were 51,639 trouble calls involving service outages or an average of one call per customer every 4 years. Of these, 38,589 were due to trouble on the customers' premises, for which we were not responsible, but which we pointed out and which the customer himself usually took care of.

The average time of clearing trouble calls is 45 minutes, with 50 per cent. of all calls cleared in 30 minutes.

About twice a year a large number of families move, in any district, and the moving orders and change in location 6644
by customers calls for carefully scheduled meter readings to

—2,832—

be sure that the billing and all records are kept up properly, and closed at the old address and opened at the new. This movement of the population is seasonal with peaks in the spring and fall, but with very little movement in the winter.

152,347 moving orders to close or open accounts were executed in 1939. That gives you an idea of what it amounts to in an electric company to have everybody move around.

In St. Louis County and outlying districts there were 28,640 such cases. 6645

—2,833—

Customers' sub-stations, serving the individual requirements of industries, large buildings, hotels, hospitals, theaters, and so forth, receive special attention by periodic inspection and tests to insure good operable condition of all the equipment. Two men with a helper and a specially equipped truck look after 92 customer-owned and 121 Union Electric Group-owned installations. That is company installations.

In addition there are twenty-seven 13,000-volt customer installations inspected by the electrical power plant department. A charge of $25 per year is made to customers who own the installation on their premises, and who contract for this service voluntarily. The actual cost of service rendered has so far approximated double the charge that is made. This would not appear to be a profitable business, but there is more to it than just a few dollars. Every time one of these customer sub-stations gets into trouble it causes
6647 an outage or may cause an outage to our system, and certainly causes an outage to his system, and results in unnecessary difficulties, and if we make a brief analysis of the value or nuisance value, if you want to put it that way, of these cases we think so far that this service is justified. We have found out by experience that the customer himself does not do it, and we have no law that will permit us to compel him to do it, and the best we can do is to try to do it for him, but if we charge in all cases what it costs us, it

—2,834—

would not be practical and he just would not contract for it.
6648 This service is, in our opinion, still on a tentative basis. I think we have hopes of reducing the cost, and I think we have hopes that the customer might be willing to accept a slightly larger charge. If we can get it on a self-supporting basis that is all we hope.

Q. Do you make voltage surveys to insure the proper service voltage at a customer's premise? A. We do. Voltage survey work has not always been done. I should say this, that over ten years ago it was universal for all power companies to regulate their general voltage standard as the

result of calls from customers who thought their voltage was incorrect.

Today, a considerable percentage of the power companies do some of this work. We have taken active interest in it now for about six or seven years, and are extensively surveying the voltage. One has to be careful when he asks another power company, "Do you make voltage surveys?". I have had an experience. Some times the answer is yes, and when you get right down to analyze the facts, all they are doing is making the usual routine checks that have always been 6650 made. When I refer to a voltage survey, I mean covering all of the major feeders on the system, with a systematic routine survey, using a great many instruments and setting a number on each feeder for a definite period, and then moving them to the next feeder. So that, by taking certain

—2,835—

sections of the system continuously, we are able to get over our system about once every four or five years on a continuous basis.

The results of those voltage surveys are turned over to 6651 the engineering departments to use as a guide for distribution changes, additions and corrections. That is, these load growths throughout the area are not uniform. Certain districts will start growing at a rapid rate, and also unless you make both voltage surveys and load surveys, you will frequently be surprised. Load surveys are similar to voltage surveys except they measure the loading of the equipment, and try to be sure that they don't overload them. In those surveys we will find some equipment which is underloaded and we can take advantage of that, and move it to some other

location. I don't mean by that, that you can go out and measure the load at every transformer on a system very frequently; you can't do it, there are too many of them.

Q. Do you check customers' range installations? A. Well, yes, we check them very quickly after they are installed. It is essential that an electric range be installed with the correct voltage, and if we give an electric range good voltage, you don't need to worry about the reception that it will get in the home. Inasmuch as we are particularly interested in promoting the sale of the electric ranges, that feature is given special attention.

—2,836—

Our transformer load survey tries to get around the system about every three years at peak times. Some of the transformers have load indicators installed. It is a peculiar thing that it is not so far different from the standpoint of the loss of equipment whether you have left your surveys alone and just lose the transformers from overload—— We made some calculations at one time to show the actual loss of property if you didn't measure them at all, and found out that that would be less than the cost of making these surveys. But that isn't quite the whole story, and after we analyzed the problem broadly we think the surveys are preferable.

In the first place, you save the outage that occurs when the transformer burns out. In the second place, you learn a lot of other things about your system that are essential to planning.

Among the surveys is an electrolysis survey. I won't go into that in detail because it has been covered twice, but I will say that there are 886 miles of these underground cables which are subject to all of these problems and have to be

watched. It takes an engineer and one field crew of two men continuously.

Also radio interference has become a factor regarding surveys, and we have an expert and a helper whose services are available to customers who complain and think they have radio interference.

About ten per cent. of the calls reported by customers, radio dealers and others, are found to involve some kind of a

—2,837—

condition with which the electric company is connected. 6656
Maybe it is some kind of line trouble or something. About 90 per cent. of them have something to do with the radio sets or some other trouble with which we have no remote connection.

One per cent. of the cases have been tabulated as incipient insulation failures. In other words, a radio will detect any kind of an arc, no matter how small, the least spitting, and whereas ten per cent. of these cases were associated with our lines or equipment, one per cent. of them represented something that may be on the verge of failing. So that if we catch one per cent. of the incipient difficulties, 6657
we probably save many failures. This is not only a service to the customer, but is probably an economy to ourselves.

Then there is a type of radio interference that we didn't used to know much about. If a 33,000-volt circuit happens to be within 30 or 40 feet of a highly sensitive radio, even a well designed circuit may be picked up a little bit. It is due to the slight amount of corona or incipient spitting—you can't see it and you can't hear it, but it has to do with the tie wire and the insulator. The solution to that is where those troubles are observed, to use some special form of insulator

6658 *Stanley Stokes—By Respondents—Direct*

which has a slight conductive coating at the point where the tie is attached.

They have a lead glaze they put on the insulator and spread it out, and that makes the contact with the porcelain

—2,838—

a larger area, whereas the tie wire is a concentrated contact at one point. The result is that we have been able to eliminate those things and there aren't very many of them anyhow.

6659 Telephone operations have been discussed to a large extent.

There is a special telephone board in the distribution department headquarters that fills a room about this size, and it is operated in connection with the trouble dispatcher's office and also has connections to the load dispatcher and his men.

That is a rather brief summary of those operations.

I attempted to avoid covering extensively the same subject that we had treated on the higher voltage lines.

Q. Does the Union Electric Group derive benefits from
6660 the interchange and pooling of technical information with other companies in the North American System? A. Yes, it does. The Union Electric Group has derived very substantial benefits and economies over the years from pooling of technical information with other companies in the North American System. Such benefits are derived not only from the normal contact through system committees on which various companies are represented, but also through less formal and direct contacts between particular companies.

Q. Does the Union Group interchange statistical data with the other companies of the North American System?

—2,839—

A. Yes. The Union Group receives monthly reports giving detailed operating data and itemized production expenses for each of the large steam generating plants in the North American System. Thus it always has before it the record of performance of the other companies' plants.

Q. Are coal samples interchanged among the companies? A. Coal samples are interchanged each month in rotative order, each company sending out a representative plant coal sample for analysis by the other company laboratories. At periodic intervals a check test is also made by the Bureau 6662 of Mines.

The results of these analyses are tabulated and a comparative statement sent to the various companies. This procedure serves the two-fold purpose of providing a check on the technique of individual company laboratories, and also gives accurately the heat content and analysis of the fuel used by the respective companies, this latter being an important factor in calculating plant thermal economy.

Needless to say, it also makes available to each company complete data on the fuel used by the others, and fuel is the most important single element of operating or production 6663 costs.

Q. Through this interchange of information with the other companies, does the Union Group receive consulting services on design for plant expansion? A. Yes, we do. Whenever one company is considering a new plant or an ex-

tension to an existing plant, the entire proposed layout, including all of the design features and selection of equipment, is submitted to the engineers of all the other companies for their comments and views.

6664 *Stanley Stokes—By Respondents—Direct*

This furnishes a unique consulting engineering service which could not be duplicated anywhere else in the country, due to the fact that there is no other associated group of utilities serving major cities of about the same size, and with comparable steam generating plants and comparable problems.

Q. Is the result of this interchange of information the avoidance of duplication of research? A. Well, naturally it does avoid duplication of research because, since the
6665 engineers of all of these companies are available for advice to each company and since the developments in each company are communicated to all companies, in effect, each company has the benefit of all improvements in engineering technique developed by all companies.

Again, there is a unique service because of the fact that the companies are of comparable size, so that their problems bear more relationship to each other than any other associated group could have.

Q. Are the consulting services of the other companies' engineers which are so made available to you made more
6666 valuable by reason of the familiarity of those engineers with your system? A. Yes, it is obxious that the engineers of

each company are familiar with the plant and equipment of each of the other companies since meetings are rotated at various companies, and at these meetings inspection trips of the equipment are made.

This information is in addition to the statistical information which they have received otherwise. Obviously again, the value of the intercompany consultations is tremendously

increased by this background of knowledge, which is thus afforded.

Q. Will you please give us some examples of benefits which have accrued to the Union Group through these intercompany contacts? A. Well, there are typical examples which I might cite of the benefits which have accrued to the company from these companies, one of which has to do with pulverized fuel.

It is typical and outstanding in the design of all of the plants of the Union Electric Company of Missouri that we 6668
do use pulverized fuel, pulverized coal for fuel. The first station in the country to demonstrate the numerous advantages of this method of firing was the Lakeside plant in Milwaukee in 1920 to 1922, following earlier experiments in that city of the Oneida Street station. This development at the Oneida Street station is an outstanding achievement because it marked the beginning of the use of pulverized fuel in this country.

At this time the Union Electric Company's Cahokia station was being designed for chain grate stokers, the only
—2,842— 6669
reasonably effective method for burning Illinois coal then known.

By close contact with the Lakeside experiments and tests and by testing several cars of Illinois coal in their furnaces, which had been shipped to them for this purpose, we early realized that this method would be ideal both for the type of coal and for the operating conditions imposed at the new proposed Cahokia plant. It was decided to use pulverized fuel at this plant, and it became the second station in the country so designed.

6670 Pulverized fuel firing has been a great boon to the Union Company system. Illinois coal has been burned on every type of advanced stoker design at the Ashley Street plant, but the characteristics of this coal had limited the performance and the result in every direction. Its high ash content, low ash fusing temperature, and clinker forming properties had limited the boiler ratings to 225 per cent.

That perhaps might sound like a high rating, but it is not.

6671 The large amount of clinker and ash refuse carried off by the unburned coal reached a point where 20 per cent. of unburned carbon in the refuse was common. The size of the steam boiler units was limited by the physical dimensions in which it was possible to build stokers, with the result that Ashley Street station had 56 boilers for a plant capacity of only 122,000 kilowatts.

The extremely slow response of a stoker fire to changes in

boiler load imposes a severe strain on equipment and personnel in an effort to maintain constant steam pressure under rapidly fluctuating loads of a utility system which serves an industry, a street railway system, whose peaks are rather sudden, and which is operating in conjunction with a hydro station.

6672

Finally, the high volatile content of Illinois coal resulted in serious smoke production, which adversely affected economy, and became a problem in the community where smoke was already a recognized difficulty.

Pulverized fuel has been an important contributor in the steady progress toward lower production cost, and the con-

sequent cheaper rates are offered by this company. Instead of the 20 to 35 per cent. unburned carbon in the refuse, this figure is usually from 2 to 6 per cent. today.

Boiler size now appears to be limited only by the quantity of steam desired in a single unit.

In 1922 Ashley Street had a boiler for each two point two thousand kilowatts. Cahokia, placed in operation in 1923, was able to supply twelve point five thousand kilowatts per boiler. The new Venice No. 2 plant now being erected has 40,000 kilowatts per boiler. Further, pulverized coal firing 6674
so adequately meets the steam requirements for rapidly swinging loads that combustion control is handled with automatic equipment, with operators giving technical supervision.

Finally, even with 37 per cent. volatile coal this is done

—2,844—

with a minimum of smoke.

Through the experience gained by our sister companies with extremely high pressure and temperature steam, our company was able to choose steam pressures and temperatures consistent with our operating conditions. The value 6675
of the studies consisted of the determination of the upper limit of steam temperature from which designers were able to devise the heat cycle leading to the highest steam pressure consistent with the greatest fuel economy.

Knowledge of creep stress of alloy steel piping, turbine blades, and valve parts was not well understood. There was very little knowledge on that subject. Perhaps I should explain there that if steel or alloys are subjected to very high temperatures over a period of years, they seem to expand

and occupy more volume permanently. In other words, whenever they are heated up and expanded they do not seem to contract to the exact same volume that they origially occupied, and the extent to which this creepage will take place at high temperatures was very much in doubt. As the result of this high temperature work actually carried out in power plants, an upper limit of 925 to 950 degrees of steam temperature was established as an upper limit for currently available materials. It is a general practice,
6677 I believe, to stay a few degrees below these limits. For example, a 925-degree design would correspond to this 950-degree limit. By staying at 900 degrees there is a fairly good factor of safety today, taking into account the present-

—2,845—

day knowledge. But without some of this research that knowledge would not have been available.

Thus with the work by our sister companies on high steam pressures and on high temperatures, the very likely error of going over 850 pounds pressure and 950 degrees temperature for our new Venice No. 2 plant, with the St.
6678 Louis type of fuel and the load strains due to parallel operation with distant hydro plants, was avoided.

I would like to make an explanatory note there, that it would have been a simple error to fall into because that type of plant could have been successfully operated elsewhere and might readily have been assumed to be equally successful with our coal. Improved knowledge on that subject shows that that would not have been the case, that our conditions were different.

Thus, through this work by our sister companies on high steam pressures and high temperatures, this error was

avoided. Furnace designs at Cahokia, Ashley Street and the new Venice plant all reflect the guidance of the other companies.

For example, early furnaces at Cahokia resulted in furnace maintenance work costing an average of 11 cents per ton of coal fired. Through the experience of the other companies, all of whom were thoroughly informed of our operating conditions at Cahokia, a water wall construction was developed that reduced this cost to three cents per ton. A development of great economic value to the St. Louis 6680

—2,846—

plant has been that of improved furnace and pulverized fuel burner designs, suited to the low grade coals available in this section of the country, at the same time permitting a high rate of furnace heat relief. By that I mean a large number of B. t. u. per cubic foot of furnace volume. Although the ash of the coal burned becomes molten at the comparatively low temperature of 1,950 to 2,100 degrees. In the period from 1926 to 1928 it was found possible to double the output of furnaces from 12,000 to 24,000 B. t. u. per 6681 cubic foot per hour. This development permitted doubling the output of several of the Cahokia boilers, and this in turn permitted the installation of a 75,000-kw. turbo-generator in the same space supplied for the boilers originally provided for a 35,000-kilowatt turbo-generator.

That, by the way, is the No. 1 machine today, and refers to the 35,000-kilowatt machine which was removed and installed in the Venice plant. That has been mentioned heretofore.

In this development, the combined knowledge of all companies sitting in on bi-monthly meetings permitted verifying and modifying this development at every stage. The final result was the successful installation that required not a single substantial change after designs were drawn up and the units placed in operation.

—2,847—

Fly ash collectors have previously been discussed at considerable length. They are just ready to be tested at our
6683 Ashley Street station, and are being installed for one section in the Cahokia plant. This application has been tremendously aided by the coordinated work of all companies keeping each other advised on such related problems as the design and performance of collectors and the handling and utilization of the fly ash material which is collected.

Q. Could you give us some typical examples of benefits which have accrued to other companies using the North American system by virtue of the development by the Union Electric Company? A. Yes, I can cite such examples.

The first major development in pulverized coal firing,
6684 after its adoption at Lakeside and Cahokia, has been of greater simplification by the use of pulverizing mills, firing directly into the furnaces. This method is known as the unit mill type of firing, as distinguished from the original central system in which the pulverized coal is first delivered to the bins from which it is taken as needed.

This method of firing was developed for the central station as Union Electric's Ashley Street power plant in the period from 1924 to 1926. Its advantages are simplicity, economy and safety. It eliminates the storage of pulverized

coal and reduces the quantity of pulverized coal in the plant at any one time from several hundred tons to a relatively few pounds.

—2,848—

This leads to a far safer condition since practically all the hazards with pulverized fuel occur where there are accumulations of coal.

Further, costs are reduced both in initial investment and in operation because of the elimination of fires, the separation of coal, pulverized coal and air, as discharged from the 6686
mill preparatory to transport, and the transport of coal with compressed air to the bins, and then the second separation of air and coal at the bins. Also, the screw feeders and the mixing of coal and air for the purpose of introducing fuel into the furnace. Those are all eliminated.

Throughout the period of the development of the unit mill system, all companies kept in close touch with the project. These companies sent representatives to Ashley Street to study the changes being made, and to witness the extensive performance tests.

On the basis of this knowledge, Cleveland and Washing- 6687
ton were enabled to develop a unit mill application for their own plants which have contributed to the extremely economical operation which has been developed in those cities.

Another item which must be mentioned is the fact that after turbines have been operated over a period of a year or two, the blading becomes covered with a hard layer of scale which arises from the impurities not eliminated from the water. This scale changes the shape of the blading and generally impairs efficient operation. It also covers up defects

—2,849—

in the blading and prevents their detection. Hence, when turbines are shut down for periodic overhaul, this scale must be removed. The use of the sand blast method, employing fly ash, introduced by the Union Electric Company, Missouri, and their group, has proved to be efficient, non-injurious to the blading, and very economical, and has been adopted by other companies with like results.

Q. Are inspection trips frequently made by the engineers of the Union group to observe new installation in the other
6689 companies in the North American system? A. Yes, inspection trips are carried out with regularity. Trips are made to one company by the engineers of the other companies, whenever there is a new system installation, so as to obtain first-hand information on design features and to observe the physical and operating characteristics of the equipment.

Q. Is information relating to current problems freely interchanged by the companies? A. Yes, there is a very free interchange of such information. Interchanges of information are carried on by correspondence. The engineer of one company will address those others concerning a certain
6690 subject, outline his company's practices, and request similar information from the others. Their replies in turn are sent to the originator, and the engineers of all other companies, so that the complete story is available to all. At the next meeting such matters are usually further discussed to clarify

any doubtful points.

Q. Are growth statistics interchanged at regular intervals by the several companies? A. Yes, at regular intervals analyses are made of the growth trends in the system output, maximum system demand, and number of electric customers

for each of the companies. This gives an index of general business conditions in the various localities, and comparative study is helpful in forecasting the long term capacity needs.

Q. Are electrical system performance data interchanged by the several companies? A. Yes, the electrical system performance data is interchanged. Annual data on system electrical losses and efficiencies are submitted for study. By "annual data", I mean 12 months ending with the current month. That data is interchanged usually more often than 6692 once a year.

Q. What do these data show? A. These data show comparative efficiencies in each of generation, transmission, conversion or transformation and distribution components, and overall operating efficiency of the system as a whole. The resultant discussion of specific features of system design accrue to the benefit of all companies.

Q. Do the several companies interchange information on circuit interruptions, and equipment failures? A. Yes, company data is exchanged on circuit interruptions and equip-

—2,851— 6693

ment failures. This data is compiled in comparative curves to show the continuous 12 months' running performance record. This study is giving each company the benefit of the experience of the other companies, and has in many cases prevented serious trouble by giving advance information of defects in equipment, switching arrangements, or operating procedure, so that the other companies could anticipate similar experiences and make corrections to avoid such failures.

I could indicate the variety of subjects on which such service records are interchanged, and among them I could mention the circuit trip-outs. By "circuit trip-outs" I mean the tripping of an oil circuit breaker supplying a feeder.

Then, cable failures. That is a comparison of cable failure records at different voltages, and per hundred miles per year, or on some such similar basis.

Transformer failures; circuit interruptions; fuse failures; fuse box failures; wood pole failures; distribution wires down. That is a sample of the type of information that is interchanged.

Any tendency on the part of one system to develop more failures than the average, at once becomes apparent, and the group of engineers of all the companies, acting as consultants, is in a unique position to determine the cause.

Conversely, any exceptionally good performance is available for analysis and example. Through such closely related inter-company activity, the service dependability of all companies has developed to a high level.

—2,852—

Q. Is information interchanged on operating problems? A. Yes, information on company operating and even on maintenance problems and on standards of maintenance practice, is interchanged and new developments in system design are frequently interchanged between the various companies. This is done not only at the regular meetings, but also by correspondence between meetings. There has been a particular benefit in the interchange of construction and equipment standards and specifications. These are based on a combination of test data and on a long accumulation of experience.

Close cooperation among the companies, with ready and frank criticism exchange in the security of their family relationship, results in the development of a class of standards and specifications which would not otherwise be possible.

Q. Have there been any cooperative investigations on various subjects? A. Yes, there have been various cooperative investigations.

To aid the companies in reaching accord on various matters, studies, designated as objectives, have been assigned to the different companies, and an analysis which took into 6698
account all of the factual and theoretical data available has been made and presented. At least 20 such objectives have been investigated.

Q. Could you give us some examples? A. Examples of such objectives might be, or are, rather, proper voltage to

—2,853—

use for A. C. distribution; size of load to be taken on the system at transmission voltages; methods of fighting generator fires; what is the best method of locating high tension cable breakdown; when are automatic A. C. sub-stations justified; what are the factors and relative weights, affecting the most 6699
economical size of A. C. and D. C. distribution sub-stations for suburban service; a determination of the electrical instrument necessary and desirable on equipment of all kinds in power plants, sub-stations, lines, and feeders; economies in repair of distribution transformers; protection of high voltage transmission systems by overhead ground wires, flux control and grading shields; study of the most economical size and type of direct current feeder cable for Edison system; minimizing cable reel losses; economies of cable sal-

6700 *Stanley Stokes—By Respondents—Direct*

vaging; investigation as to the advisability of the use of factory-made bus structures. Those are representative examples of the type of assignments that have been made.

Q. Can you give us examples of developments in the field of transmission and distribution which Union Electric has participated with the other companies? A. Yes, the swinging cross-arm transmission structure, and the design of an improved type of "H" frame wood pole construction, which has been previously presented here, are examples of that type of
6701 cooperative design.

Several of the cities of the North American group are in geographical sections subject to frequent lightning storms. The St. Louis group made these studies to which I have re-

ferred, and which have been discussed at length heretofore, and they conferred with the other companies as the plans were developed.

The basic design of these two lines was checked by all companies, and we had the benefit of their views. This pool-
6702 ing of experience is in no small degree responsible for the most exceptional success of these two lines in resisting interruptions due to lightning.

One item of development recently by the St. Louis group is an inexpensive meter for measuring maximum, minimum and average voltage at any point on the system, and in particular on service connections. Through closely regulated voltage and particularly in control of maximum and minimum voltage, marked improvements are possible in the efficiency of the utilization especially in lighting service.

Judging by the interest shown in the new instrument, it will be used extensively in making the voltage surveys previously referred to.

The use of carrier current communication methods has been an important advance in load dispatching, and the application of these methods in the Union Electric group has been aided materially by the cooperative opinions and advice of the various companies.

This installation was the logical outgrowth of pioneering work by the company engineers, together with later advice 6704
and assistance from an engineer of the North American Com-
—2,855—
pany. The equipment is in regular use in load dispatching over the entire system. Automatic sub-stations have been a particular field in which the St. Louis group of companies has pioneered, particularly in the use of controlled circuits.

An example of a load-shifting device which automatically divides the load between two machines on a predetermined basis, was referred to in our previous description.

That device also will automatically shunt the load to other machines when one is shut down. 6705

The ground relays on induction voltage regulators have also been mentioned. These relays prevent the circuit from becoming reclosed in the case of regulator trouble. The other companies in this case were enabled to learn of the merits of the arrangement almost as soon as it was installed and tested, an advantage which would not have been available were it not for this intercompany cooperation.

Another subject on which attention has been recently focused is that of immediate versus delayed reclosing of cir-

cuit breakers, at the time of a system short circuit fault. It was found that relatively few circuits stay closed, that is in operation—with instantaneous recloses. Nevertheless, it offers superior overall performance to the customer, since with instantaneous reclosing the service is not interrupted, whereas with the service off for five seconds or more some of the customer's equipment would be shut down.

—2,856—

6707 The Union Electric group made a special study of this development and in conjunction with Mr. Wallau, a Cleveland Electric Illuminating Company engineer, reported the benefits and limitations to all companies. We mentioned the thermostat among our description of automatic sub-station pioneering. That was one of the items which the St. Louis group made available to the other groups. The thermostat applications have also been used for automatic control of the cooling water on transformers as well as for the other applications which I have previously mentioned. That type of development is passed around to the other companies at the first opportunity, which is usually shortly after it is

6708 developed.

The Union Electric Company also was one of the first of the companies to adopt measurements of dielectric loss and insulation power factor as the index of the condition of the dielectric.

The company's present policy is to periodically test by this method all bushings, transformers, potential devices and oil circuit breakers above the 10 kv. classification. Tests are also made on certain cables, potheads, and lightning arresters.

Without the intercompany cooperation, such rapid and beneficial response to outstanding improvements such as this, could not have been effected.

All companies have interchange of experience data and

—2,857—

testing procedure for lightning arresters, and this work has been the basis for the establishment of a definite policy for the design and application of such arresters. In this case the Union Electric group were the beneficiaries. We had some difficulty with some lightning arresters in the last two 6710
years, and got some very valuable information from the other companies.

Another distribution development which is currently being studied and developed is the general subject of service connections to domestic users. A rapid increase in the use of electric cooking ranges has brought this subject to the fore because of the improvement which can be effected, particularly by the use of the outdoor meter and enclosures, and simplified wiring connections. Savings are possible by development of new wiring systems, materials and methods, all of which pass through some experimental stages. By 6711
pooling their experiences, the associated companies have available data from which their procedure can best be directed and also assure minimum wiring costs to the customer.

Union Electric group has been studying the method used for service connections by their related companies, and have greatly benefited by a knowledge of those changes which have proven to be desirable.

The trouble department of Union Electric group, particularly the St. Louis division, is being remodeled on the basis

6712

of experience gathered from the other companies. This change

—2,858—

also includes the subject of radio communication for emergency dispatching in case of transmission or distribution trouble.

Another item of considerable moment, because it has been the source of some rather extensive lawsuits, is the noise from transformers. This transformer noise causes complaint at certain locations from the public. These complaints
6713 originate in residential neighborhoods, which are in the vicinity of large power transformer installations. I should say that the lawsuits to which I refer did not occur in our system, but we had such complaints of difficulties and recognized the responsibility might turn out to be with us.

The noise may be described as a low-pitched, steady humming which becomes objectionable during the night period when the general noise level has subsided. Mutual investigations among the companies have been helpful upon this subject. These included, for example, procedure for making noise measurements and writing the specifications
6714 covering noise for the purchase of equipment, particularly transformers. As a result, three transformers now on order have been designed for an appreciably lower noise level.

Q. Can you give us an instance in which the Union group have loaned personnel to a sister company? A. Yes. Our group loaned to the Milwaukee company the services of the sales manager, Mr. C. D. Michel. He was the sales manager or is the sales manager still, for the Union Electric group.

—2,859—

He was loaned to the Milwaukee company and completely

6715

reorganized their sales effort. Mr. Michel was at that time, and still is, a leader in the field of sales promotional work.

Q. Can you give us an instance where the Union group has borrowed personnel from a sister company? A. Yes, the Union Company has just recently obtained the services of a member of the staff of the Potomac Electric Light & Power Company of Washington, Mr. William Jones, who is an expert on customers' record filed.

We also borrowed Mr. Campion, a consulting engineer of the Potomac Electric Light & Power Company, to give us consulting advice and assistance on the foundation work for Venice plant No. 2.

6716

Mr. Campion is a recognized foundation expert, and we called him in, in connection with our piling and foundation work for the new turbine.

Q. Can you give us an instance in which the Union Company has sent its personnel to a sister company to investigate their practices? A. Yes. Only recently the Union Company sent members of its organization to Milwaukee to study the reasons for the remarkable reduction in building costs which had been achieved by the Milwaukee company.

6717

Q. Does the Union group feel free to call on other com-

panies in the North American group for help? A. Yes, we are very free to do so. Whenever any problem arises as to which we wish the combined experience of the other companies, or the experience of any other single company, we feel entirely free to write, requesting such information, even though we know it may require cosiderable work to answer our inquiry. We feel free to do so, because the other com-

6718 *Stanley Stokes—By Respondents—Direct*

panies are in the family and they are equally free to write to us. We feel equally free to give information within the family. There is much of this informal exchange of information. This relationship simply does not exist outside of the family group.

Q. Now in the meetings of the engineers of the companies in the group, has the size of the group any bearing on the extent and nature of the information interchanged? A. Yes. I consider that it does. The smallness of the group
6719 makes it possible to arrive at results which would be impracticable in a large industry meeting, and the smallness of the group is one of the essential factors in deriving the most benefit and it distinguishes this intercompany work from other professional aid which we receive from other contacts. This little group, you see, is not only small, but well acquainted.

Q. Does the gross relationship within the group contribute to the freedom and frankness of the interchange of information? A. Unquestionably. We know that we can ask any question of another company within the family, and get
6720 a completely frank answer, just as we give any information

requested without reserve to any other member in the family group.

This element of frankness is unique and entirely restricted to these family relationships. In other words, we would not and could not give information with anything like the same degree of frankness to any outside company, nor would any outside company expect it, nor would we expect such frankness of them.

Q. Do savings and economies result from these inter-family contacts? A. There is no doubt that the Union group, and each of the other companies, derive important savings and economies in the aggregate from these inter-family contacts. Naturally it would be difficult to put an overall dollar valuation, but certainly the savings are most important and make a large contribution to our efficiency.

Mr. Odell: Just as a matter of information—and this may have been previously answered—do you attend these meetings that you spoke of a while ago? 6722

The Witness: Yes, I have been a member of the intercompany electrical committee for many years.

By Mr. Browning:

Q. Is your meter reading group an important customer contact group? A. Yes, it is, and in analyzing some meter reading costs which I had occasion to go over, it was very evi-

dent that we were hiring more intelligent and attractive men because of the value that we know that they have to the company in its contacts with the customers. In fact, they are about the only contact that the average customer has with the company, and the attitude of the meter reader frequently, in the customer's mind, sets out the kind of a company you have, and it is desirable to have high-grade men. Of course it goes without saying that they have to be honest. 6723

Many customers send payment of their bills through the mail, and seldom contact any representative of the Union Electric Group except the meter readers. Others pay their bills at the multiplicity of pay stations to which previous

6724 *Stanley Stokes—By Respondents—Direct*

reference has been made. The meter readers are therefore selected on a basis of their judgment, tact and ability to meet customers. They must conduct themselves on a customer's premises in a manner reflecting the company's desire for good customer relations.

Q. Can you tell us something about the functions of the meter reader? A. A meter reader has to first read meters once a month, he has got to record the readings on the individual customer meter route sheet. He has got to sub-
6725 tract the current readings from the previous month's reading, and compute the current month's consumption; we check the reading if the consumption appears too high or too low; attempt to account for fluctuations if recheck shows that the reading is correct, by inquiring of the customer and deter-

—2,863—

mining that the meter is registering mechanically; report service complaints or comments by the customer; also notices of moving and other matters which require further handling; execute re-read orders and special read orders received from the billing division, credit, adjustment, and collection divi-
6726 sions, sales department and other departments contacting customers. That is, they may call for a re-reading for any one of a large number of reasons.

Q. Will you describe the work of meter reading? A. Yes, the meter reading in the early days of both the telephone and the electric companies was always carried out on a certain day of the month. Of course that became impossible after the company grew so large, and the billing districts and meter reading districts are made up now so that the reading is continuous every day of the month. That not only

equalizes the work on the meter reader but on the accounting department and other departments. I have forgotten how many sections we have, but I think there are some 23 or 25 billing districts, something on that order.

Q. Are the territories served divided into districts for this purpose? A. Yes, in other words they divide the territory up into these various meter reading districts, which we usually refer to as billing districts, and the bills are sent out at regular intervals so that the customer in a given district always gets his bill about the same day of the month, each 6728

month, but he won't get it the same day that some other customer does. In other words, we will bill district No. 1, for example, on the first of the month. District No. 5 may be billed on the 5th of the month, and so on. It is a continuous performance because it is impossible to either read the meters or bill 350,000 customers on any one day. All big systems do that today.

I believe that we—I know that we did for several years—read the meters to the nearest even kilowatt hour, except on final bills, which are then read exactly. That is a means of 6729 eliminating half of the numbers that had to be dealt with. I think that advantage has disappeared though, with the use of the machine billing, and I think they are now read as they read. There would be no loss if you just read to the nearest kilowatt hour, and if your final bill is rendered accurately nobody has either gained or lost. It simply happens that we used to use a rubber stamp system, and that cut the total amount of work about in two. But with machine billing that probably has no further advantage.

6730 *Stanley Stokes—By Respondents—Direct*

Q. How many electric and gas meters are read monthly? A. Well, they read them all, but at this particular time—I had that figure looked up, and it was 356,492. That is probably a little different today, but that was at the end of December.

Q. In addition, are inactive meters checked? A. Yes, —2,865— there is always a lot of re-checks, and they ran 28,000 on the inactive meters. You see, we leave those meters in the
6731 premises when people move so that they can obtain service as soon as they get into the house, but we have got to check on those to see whether anybody has moved in, and also to see that the meter has been used. Meter readers compute the consumption of the accounts other than commercial, which are machine billed, by subtracting the previous month's reading from the current reading. This eliminates an operation in the office and calls to the meter reader's attention the unusual fluctuation of any customer's bill while he is still on the job. In other words, he makes the computation and he will check anything in error, either he may have read
6732 it wrong or it may be an unusual use. If he catches that before he leaves it will save a re-check and return trip.

These meter readers also execute a large number of requests for re-reads, as mentioned above, and special re-read orders where some group in the company needs the information, either suspecting that the reading isn't correct, or for any other reason wants it re-read.

One of our major difficulties in reading meters has always been that the customers are away from home, and you can't get in, and if you do make a meter reading through a basement window, the customer always complains and perhaps

says that you didn't read the meter at all because you couldn't have gotten into the house, and we have had to send a meter

—2,866—

reader back out to show him that he could read the meter through the basement window.

But the real difficulty, when meters are located inside a house, is that so many trips have to be made back to a house on account of a customer being away. That is the advantage, or one of them, of the outdoor meter. If he can't get at the meter to read it on his scheduled call he leaves a card which 6734 requests that the customer mail it in, and if he doesn't get that he will make another attempt to read it.

About 25,000 of these "Read Your Meter" cards are left at customers' premises every month of which roughly 70 per cent. are returned by the customer. Consumption on the remaining accounts, for which no readings are obtained, is usually estimated, with the exception of commercial customers. These estimated readings are of course automatically adjusted when the next regular reading of the meter is taken.

Q. Do you devote attention to reducing the cost of meter 6735 reading? A. Yes, we try to keep the cost as low as is consistent with the duties that we ask the meter reader to perform. I have listed some of those duties. In our force of 74 meter readers, who now not only read the meters but perform the other items which we have discussed, they take care of the metropolitan St. Louis, St. Louis County and four adjacent counties in Missouri, as well as certain areas in Illinois including East St. Louis and Alton, a small terri-

—2,867—

tory in Iowa, and including the city of Keokuk, Dallas City and Fort Madison, all in Iowa. The total area is about 3,100 square miles.

The cost per customer of reading these meters and handling the other re-reads and doing the work itemized is about 45 cents per customer. In example, in the year 1939 the expenditure was $161,284, representing a cost per customer of 45.2 cents. This cost varies within limits from 40 to 45 cents, depending on varying conditions.

6737 The accounting has a little effect on it, the question of whether you allocate your heat, lights, building expense, air conditioning, and things like that to the bill work, or whether you keep it in a separate account and set it up by itself. Some people do it one way and some the other. In our case, we allocate all the expenses in the billing division to the billing, and credit the collections to such items, in other words distribute the expenses of the office, even to the extent of the cost of the air conditioning.

Q. Do your customer billing departments have an effect on good customer relations? A. Did you say the customer

6738 billing departments?

Q. Yes. A. Well, to the extent that our rates are low, I should say that the customer billing departments would have a good effect. I know that the meter reading and the people that are in contact with the customers do have a good effect.

In other words, our relationship with the customers is extremely good. The contact is principally through the meter reader, himself. We have a department which takes care of customers' service calls, and we try to be as polite and courte-

ous as it is possible to be, and to the extent that I have had contacts with that division—I used to be very closely associated with a division of that work—I feel that the customers are well satisfied with the service that the company renders, and I think most of them are pretty good friends of the company.

Mr. Browning: We have now reached a good stopping point, Mr. Examiner, and I suggest that the hearing be adjourned until Monday morning.

6740

The Examiner: I understand that you are going to continue next week with Mr. Stokes, is that right?

Mr. Browning: With Mr. Stokes and possibly other witnesses, that is right.

The Examiner: All right, I think that is a reasonable application, and the hearing is now recessed until next Monday morning at 10 o'clock.

(Whereupon, at 4:15 o'clock, p. m., the hearing was recessed until 10:00 o'clock, a. m., Monday, October 28, 1940.)

—2,869— 6741

6742

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

6743

Hearing Room 1101,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Monday, October 28, 1940.

Met, pursuant to adjournment, at 10 o'clock a. m.

6744

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD and HERMAN ODELL, Attorneys for the Securities and Exchange Commission.

 6745

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Hamilton: Will you resume the stand, Mr. Stokes?

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued): 6746

Q. Will you refer, Mr. Stokes, to Respondents' Exhibit No. 54. Last week you undertook to get for us the basis for the caption heading appearing on that exhibit, and stated as being the "B. t. u. per Switchboard Kilowatt Hour". Please state whether the kilowatt hours referred to represent net output or gross output? A. Those are net output. I had the figures verified and checked them carefully.

Q. This represents, then, net output from the generating stations? A. That is right.

Q. At the conclusion of the least hearing, I believe you were describing the billing and customers' accounting procedure. Will you explain how electric bills are prepared and distributed among your customers? A. Each month the bills are rendered to 349,019 electric; 7,473 gas; and 316 steam customers. Those figures, of course, change monthly, 6747

by slight amounts, but that is the approximate amount or extent of the billing operations.

Individual customers' accounts are maintained and all charges and payments are kept currently posted. The ob-

jectives, of course, are to get bills out promptly and not delay the customers. The customers like to receive their bills regularly; when they get used to a certain date, they want to get it on that date.

To provide accurate and current record of customers' accounts, at all times; to maintain good customer relations, by making the records available to departments who answer customers' inquiries and to perform these operations at the lowest possible expense.

6749 The names, addresses and folio numbers, where used, are embossed on metal addressograph plates, and filed in district order. By "district" I mean the billing district, the various territories having been divided up into individual districts, called billing districts.

The group that does this work also heads up all new customer ledger accounts, and meter reading route, and prepares the semi-monthly payroll sheets, and in addition to that addresses dividend payments to the stockholders of the Union Electric Group.

Other work which the mailing and addressing depart-
6750 ment does includes the sending out of the Union Electric Group's monthly magazine; preparing a portion of the

periodic meter test orders; addressing advertising material for the sales department; and any other work requiring the use of the addressograph equipment.

The plate-making operation is carried out on what is known as an addressograph-graphotype machine, and a voluminous addressing operation is accomplished on the addressograph equipment built for that purpose.

Customers' bills are addressed on a district basis just prior to the district billing dates, so as to reflect all changes in customers' names and addresses made during the month. This group cooperates closely with the billing group in maintaining the schedule set up for rendering bills.

Q. What are the subdivisions of the billing and customers' accounting division? A. Well, I take it that you refer to the district separation or division? That is, the billing district, which starts out by representing a given territory which the meter reader covers, is the basis for all the succeeding 6752
operations, because the meter-reading sheets and records are followed by billing and accounting records, all on the district basis.

You see, it would be a practical impossibility with so many customers to get out all bills on one day of the month for the entire number, or to read all meters as of one day of the month; it simply couldn't be done, so they are broken up into continuous operations, so that one district is billed

on, say, the 18th of the month, and another on the 20th, 6753
and so on. So that the performance is a continuous operation, and the month's energy as reported as kilowatt hours sold, is just an arbitrary cutting-off point, once a month, on this billing operation.

Q. Now, state whether you have a customers' record division, and if you have, explain what its functions are? A. Well, the chief functions of this customers' record division which we do have, are the opening of new ledger accounts for customers when service is connected, and closing the account when service is discontinued. Also, the preparation

6754 *Stanley Stokes—By Respondents—Direct*

of monthly bills to customers, the maintaining of accurate records of customers' accounts.

This group opens the customers' ledger accounts from the record of service applications, contracts, or any other source indicating the fact that the customer has started to use service. It closes these accounts upon receipt of executed disconnect orders.

If a new service order covers a new premise, it is necessary to insert a new meter route sheet in the meter reading
6755 book. If, however, the order covers an old premise, the new order is entered on the existing meter-reading sheet unless there is a change in the class of service.

New ledger sheets are made up on all orders except those
—2,874—
involving change of load or rate, corrections of load, and meter changes. This group also enters the change of rate data, meter changes; merchandise, lamp and sundry charges, and all other billing data pertaining to customers' accounts.

The amount of such entries annually was: 107,686 applications for service; 161,022 appliance charges; 137,673
6756 lamp and sundry charges; 107,254 disconnections of service. Those figures were taken for the past year, but that is just an indication to show the extent of the work.

The residential and small commercial accounts group transiers meter readings, prepares and proves the monthly bills to customers on the rate schedules, and accumulates revenue and statistical data required on these operations.

The large commercial and industrial special contract group enters demand readings and manually prepares monthly bills for the larger accounts. The volume of the

large accounts does not warrant special billing equipment as is used on the residential and other types.

Many of these bills are based on meter readings taken at the end of the month, instead of at the regular district scheduled reading dates, so that the billing period will correspond with the calendar month to meet the customer's accounting requirements. These large customers are big industrial firms, and they have their own accounting problems to meet, and have requirements for making reports on calendar dates,

—2;875— 6758

and as long as there are not such a huge quantity of them, we make every effort to meet their requirements by making special meter-reading periods for them.

This same contract group, also manually prepares bills for the steam service in the business section of St. Louis. Steam meters are read at the end of each month by the steamheating department and bills are rendered promptly after readings are received.

The annual production of the above billing groups consist of: 3,303,154 electric bills mechanically prepared; 885,102 electric bills manually prepared; 3,793 steam bills manually prepared; and 89,659 gas bills manually prepared. 6759

Those gas bills are for the St. Louis County Gas Company, which is a separate company, but operated with the same help and facilities.

In the areas where the billing operation has been mechanized, Burroughs Public Utility Billing Machines are used. These machines simultaneously print the bills, record the charges to customers' ledger accounts, and produce a tape showing accumulated totals, which provides an efficient method of proving the billing operations.

6760 *Stanley Stokes—By Respondents—Direct*

The bills are set out on ordinary United States one-cent post cards, which are sent to the printers, where the various bill forms are imprinted on the cards.

The bookkeeping section posts and balances customers'

—2,876—

accounts, maintains the accounting controls, and prepares journal entries to record customer accounting transactions. This group is responsible for sorting and posting cash stubs received daily from the cashier's division to the individual
6761 customer ledger accounts. Postings are made by date stamps imprinted above amounts paid, requiring minimum posting time. All posting is proved by comparison of adding machine totals of items posted out, with adding machine tape totals of the cash stubs received.

Also, in their duties is included the maintaining of accounting controls on all customer ledger accounts, including large commercial, steam and gas accounts.

Further, they are engaged in preparing journal vouchers recording revenue from electric, merchandise and steam sales; charges to uncollectible accounts; transfers and ad-
6762 justments; and any other entries affecting the customers' accounts.

Q. How frequently are customers' accounts balanced? A. Customers accounts are balanced monthly. In order to maintain an accurate control of accounts receivable, all customers' accounts are balanced on a cycle basis, monthly. That has to do with my previous explanation of the fact that these billing operations are continuous, and there are roughly 20 or 25 billing districts, and you have got to establish a point of beginning and ending for the month, by

just an arbitrary basis, but the cycle is exact and repeated.

—2,877—

To facilitate this balancing, each territory served is broken down into these districts, which in turn are subdivided into what we call controls. The purpose of the balancing operation is to verify the correctness of all entries, including charges, payments, transfers, adjustments and corrections made during the month. This is one of the most important operations of the bookkeeping group.

The ledger cards, which record the customer's account, 6764
are filed in district and address order, and contain meter and rate data for individual customers, and show the customer's name, date of contract, readings in kilowatt hours used, charges and credits. Collection information is also recorded on these cards. That is, they make notes on the cards as to a man's credit rating.

Q. Is the work of the division that you have just described coordinated with the work of the other departments of the Union Electric Group? A. Well, they do have to cooperate very closely with the other departments. The credit, adjustment and collection division uses current customer ledger 6765
accounts extensively in determining the credit of customers. These ledger cards are filed near this group, and are available at all times.

Records of customers' use at former addresses, and of uncollectible accounts, are also readily available.

Adjustment and collection operations are likewise facili-

—2,878—

tated, as a complete record of the customer is obtainable, resulting in selective collection action and speedy and efficient answers to customers' inquiries and complaints.

6766 *Stanley Stokes—By Respondents—Direct*

The sales department currently prepares analyses of consumption by rates and classes of service in connection with continuing rate studies, and the close coordination of the billing and customers' accounting group assists materially with this work. The nature of the operations of the meter department, electrical distribution department, and cashier's division of the treasurer's department, also requires the close coordination of the billing and customers' accounting group.

Q. Is the unit cost of these operations kept at a low level?
6767 A. Yes, the cost is kept at a very low level. They have 156 employees required to execute the addressograph work on customers' accounts, record customers' orders, render bills, and maintain records on customers' accounts. The cost of this work for the year 1939 was $.7571, slightly over 75 cents per customer, for the total operation.

Q. That is on an annual basis, is it not? A. Yes, and the figure that I read was for the year 1939.

Q. Now explain, if you will, how applications for service are handled in the Union Electric Group? A. We make every effort to make an application for service the simplest possible
6768 —2,879—
operation. That has not always been the case, because I can recall years ago, when I first went to work for the company, that it was quite an operation to get service, a rather formal matter. You had to make an application and fill out a contract; either a salesman had to go and call on you, or you had to go and hunt up the office somewhere; and frequently a meter had to be set.

All in all, it was one of the things that you had to anticipate some time in advance if you wanted to move.

6769

Today, the meter is usually left in place, and there is very little formality. The customer can get electric service by throwing in a switch, when he goes into the house, and make what little arrangements have to be made later.

The service orders are immediately executed upon application, for the convenience of the customers. Application may be made in person at the Union Electric's main office, or at any of its branches, or subsidiary company offices, or may be made by telephone or by letter.

6770

In most of the territory served, residential and commercial customers, moving in to previously occupied premises, may start service at once by throwing in their own switch, and accommodating us by mailing in what we call a meter tag. There is a tag left on the meter and the customer can take that, and close in the switch and send the tag in, and he fills out the application which is attached to this tag.

—2,880—

The usual application for residential service is simply in a form requiring only the customer's name, address, occupation, and location of employment, and the location at which service was formerly used, if any.

6771

Commercial applicants execute a service agreement which is also relatively simple in form. The whole effort is to make the operation simple and convenient, and to have a lack of red tape.

The way the thing works is surprisingly well. Some of these methods were adopted with some thought that they might cause considerable difficulty, but nothing of any consequence ever arises. The company wouldn't think of going back to more elaborate requirements for these contracts.

Q. What is the general nature of the group's credit policy? A. Very, very liberal credit policy is followed. As a matter of fact, our credit deposits are not at all extensive. An average of about 9,000 applications for service is received every month, the majority of which are successor connections, due to a customer moving from one address to another. All customers who have a good or fair paying record at a previous address are granted credit immediately, as are new customers whose credit indications are satisfactory.

6773 Surety deposits are required only of previously poor-paying customers, or new customers where there is some reason

to consider them to be of doubtful rating.

The amount of deposit, when required, is usually the equivalent of bills for two months' service. It is the general practice to refund surety deposits, with interest, after a customer has established a fair paying record over a period of 12 months. We try not to retain any more surety deposits than are absolutely necessary. Surety deposits on hand at the end of 1939 numbered approximately 19,600, amounting

6774 to a total of $138,850, or an average of about $7 per deposit, for all classes of customers.

Residential customers' deposits ordinarily do not exceed, at the most, $5 each. The ratio of the number of surety deposits on hand to the total number of customers served, is about 5 per cent.

The company will also accept guarantors in lieu of surety deposits, in case customers are not able to otherwise establish a credit, a satisfactory credit.

In addition to the surety deposit policy, customers are also granted liberal installment terms on merchandise pur-

chases, for which a nominal carrying charge is made. In order to encourage the use of electrical appliances, this convenience is extended to purchasers of merchandise from other dealers independent of the Union Electric Group. In other words, we frequently make credit installment arrangements through small dealers so that they can extend credit to their customers for the purchase of electric appliances.

—2,882—

That will be discussed later in more detail.

Q. Are discounts provided for prompt payment of bills? 6776
A. Yes, there is a discount on the residential bill—well, on all bills—of 5 per cent. on the first $25 of the monthly bill, and 1 per cent. on all over $25, if payment is made within 10 days after the date of billing.

Some of the rate schedules provide for a straight discount of 5 per cent. for prompt payment. Certain power and municipal contracts are executed on a net basis, and do not provide for such discount.

Forfeited discounts, where the customer does not pay within the scheduled period, are frequently allowed on bills paid from one to several days after the last discount date, 6777 provided the customer has a good past paying record, or has a valid excuse.

For example, in the summer time, people take vacations who are otherwise prompt to pay, and when they come in we make an allowance for that, and they don't lose their discount.

Q. Who handles the collection of customers' accounts, and the adjustment of customers' service inquiries? A. Well, that is the principal function of the credit and collection

division. Their job, in addition to passing upon the credit of applicants for service, is to collect past due accounts, and to handle customers' service inquiries and adjustments. We

—2,883—

keep constantly in mind, in carrying out all of these functions, to maintain good public relations by following a liberal collection policy, and by giving delinquent accounts selective attention.

In general, collection treatment is accorded only to ac-
3779 counts which are two months or more delinquent, if previously good or even fair pay; and one month delinquent if of poor pay reputation, and if in arrears by over $3.

Delinquent accounts to be given collection treatment are selected individually each month by experienced and responsible collection division employees, and the general practice is to grade the accounts for collection effort, beginning five days after the last discount date. That would be 15 days after the date of billing, the discount period being 10 days—and classify them into about three divisions: customers with good or fair past paying records are in the first division,
3780 and for those they send a little notice calling attention to the fact that they probably forgot to pay their bill, but nothing is said about collection or cut-off.

Now on the second class, new customers with unknown credit, this little reminder notice is usually followed up within about 5 days by a mail or collector cut-off notice, and after another 5 days the collector will call.

Customers in this class are given every opportunity to pay or make satisfactory arrangements, without actually cutting off the service.

—2,884—

6781

In the third class, customers which are frequently delinquent, or what are known as habitually poor pay—two mail notices, spaced 5 days apart, are followed up by collectors or cut-off men, after another 5 days.

In other words, they don't just treat everybody alike, but they take into account the customer's previous record, and our actual experience with his habit of paying his bills.

Disconnection of service for non-payment of bills is made only as a last resort, and even then it is frequently deferred to avoid distress, or inconvenience to the customer in case 6782
of illness or for other just cause. If there are any doubts, they are resolved in favor of the customer. This is evidenced by the fact that in the three largest divisions of the system, comprising over 300,000 customers, cut-offs averaged less than one-half of one per cent. during 1939. Reconnections, after having been cut off, during the same period and for the same divisions, average approximately 80 per cent. of the number disconnected.

Charges ranging from 75 cents in the metropolitan area, to $1.50 in the rural territory, are made to customers for reconnecting the service. 6783

Irregularities and current theft cases are given individual treatment by trained investigators and adjusters. The number of such cases in relatively small in proportion to the

—2,885—

total number of accounts with which the collection department deals.

Employees of the credit and collection division assigned to the handling of customers' complaints and adjustments, are carefully selected, and are given preliminary training for

6784 *Stanley Stokes—By Respondents—Direct*

that work, as well as close supervision in the performance of their duties.

The policy of the Union Electric Group toward high bill complaints is liberal, and each case is considered as an opportunity to improve customer relations. In other words, a customer coming in and complaining about a high bill may have a just complaint, and there may be something wrong. Frequently there is not. In any event, he is a customer who, if he goes away dissatisfied, is a bad thing for the com-
6785 pany. So they give those customers careful attention and go right out and investigate their complaints, and try to run them down and establish the facts, and if there is any doubt about the complaint, they resolve it in favor of the customer until he repeats the thing too often. Most of them don't.

When high bills are found to be excessive, due to losses of energy not preventable by ordinary prudence, an offer is made to share the loss and the customer is advised to rectify the conditions. Once in a while there is a ground or partial ground in a customer's premises, beyond the meter, and the
6786 current is registered through the meter, and goes to earth

without enough of it to blow a fuse, and the customer may have a very high bill. It sometimes can run up an extremely large bill in one month. We know, of course, that the customer got no use out of that, and that we didn't lose the retail price of the energy, we lost the cost of it, so we make an effort there to adjust it with the customer.

Division supervisors at all Union Electric Group offices are easily accessible, and every effort is made to give prompt attention to each customer who has any form of complaint.

Q. Can you state the extent of customer contacts arising out of the operations of the credit and collection division? A. There are roughly 49,000 cases handled per month, based on the operations for the year 1939, which might be divided into groups as credit applications for service—107,620 per year, or 8,970 per month; delinquent accounts handled—444,610 per year, or an average of 37,050 per month; customer service problems—32,280 per year, or 2,690 per month.

The combined total for the year of all of these cases was 584,510, or 48,710 average per month. 6788

Q. This is 1939? A. That was for the year 1939.

In the handling of these cases, recorded statistics for the larger communities served to indicate that the credit and collection divisions make about 143,000 customer contacts per month, which can be classified into four groups, such as office contacts per year—251,170; mail contacts, including

—2,887—

collection notices—901,870; collector contacts—298,430; telephone contacts—263,740. Or a total of 1,715,210 per year, or an average of 142,940 per month.

The ratio of approximately 3 customer contacts to each 6789 case handled is an index as to the method of this division. It is felt that much is gained in terms of preserving and improving good public relations by giving each case individual, personalized attention, rather than mechanical treatment. Yet at the same time, it is our effort to accomplish these results with a minimum of expense.

You see, the meter readers and the collection group are the ones that get in contact with the customers, and it is an important part of the company's operations to see that the customers' cases are sincerely and intelligently handled.

6790 *Stanley Stokes—By Respondents—Direct*

The sales department has continuous contact with the customers, but there are not as many of them, and they don't have as many different people to deal with. So that this other division really establishes, I think, more than any other one group, the company's standing with its customers.

Q. Now is this division organized to operate efficiently and at low cost? A. The organization of this group has received probably as much study as any group in the various
6791 group of companies, and the different subdivisions cooperate with each other in a coordinated manner, and they have studied the various possibilities by which costs could be re-

—2,888—

duced.

I can recall a number of years ago that a study at that time indicated that with the then development of billing machines, and the then cost of labor, it was questionable whether we could really afford to use the billing machinery. Since that time the machinery itself has been improved, salaries have been increased, and our company's business has
6792 multiplied. So that today it is economical to do so, and it is a matter of making continuous studies of that type that keep the total costs reasonable.

They have round table discussions periodically to educate and improve the efficiency of the personnel engaged in this work, and division supervisors are encouraged to exchange ideas on methods in order to promote better results, as well as to reduce costs, whenever commensurable with the continuance of the collection policies, that is, as to giving the customer personal attention. We try to keep the costs as

low as possible, but not without regard to the service rendered.

Q. Now indicate very briefly, if you will, the unit cost per customer of the operations of the credit and collection division? A. The credit and collection division, and its coordinated operations, including the cost of customers' contracts and orders, the pay and expenses of all employees

—2,889—

engaged in work on customers' applications, contracts, orders, complaints, and inquiries, as well as supplies and 6794
expenses incurred in connection therewith, such as transportation, stationery, postage, building service, including light, heat, refrigeration and janitor work—all those costs are allocated to the billing and collection department. There doesn't seem to be complete uniformity in the accounting in all companies in this respect. Some companies do not allocate the value of the floor space and the light, heat and rent, they keep that as a separate item by itself, but in our case that is all included.

These costs, in terms of dollars of gross electric, heating and gas revenues, excluding energy sales to subsidiary com- 6795
panies, have averaged as follows—well, I won't take the time to go into the details of the make-up of this thing, but I am just going to read the total cost per customer. That is 25 cents per customer for the entire operation for the year 1939. It doesn't vary a great deal, it seems to run within a cent of that amount right along.

—2,890—

The cost of credit investigations and records includes the pay and expenses of employees engaged in investigations of customers' credit, and the keeping of records pertaining there-

6796 *Stanley Stokes—By Respondents—Direct*

to, the cost of handling surety deposits, credit reports from commercial agencies, and supplies and expenses, such as transportation, stationery, postage, and building service. These costs, accumulated for the year 1939, were 7 cents per customer.

Summarizing, those represent credit investigations and records expense.

Now, the collection expenses include the pay and expenses of tellers and cashiers, and collecting agents' fees, collectors
6797 and other employees engaged in collecting customers' bills; the cost of disconnection and reconnection work; and transportation, stationery, postage and other supplies used and incurred in connection therewith. This expense, including those items for the year 1939, was 64 cents per customer. That 64 cents applies to collecting expenses.

The next item is the uncollectible accounts' losses. Uncollectible accounts losses are relatively low, giving evidence to the efficiency with which the methods of the credit and collection division are carried out, even with the liberal policies in effect, and every consideration accorded to the cus-
6798 tomer. The total losses, in terms of revenue per customers were, for the year 1939—24 cents.

—2,891—

The sum of all these items of expense per customer for the year 1939, which includes customers' contracts and orders, credit investigations and records, collecting expenses, and uncollectible accounts, amounted to $1.20 per customer.

I would like to state this. It is difficult to get any comparison as to whether these figures are really high or low. It is hard to ascertain that, and about the only basis upon which I could relate this would be to obtain some form of

national comparison. It happens that the only such comparison which I have been able to obtain is from a customer's accounting and collecting expense report from the records of the Federal Power Commission for 1938, a report entitled, "Statistics of Electric Utilities." Now, in 1938, our costs per customer happen to be $1.19, instead of $1.20, it varied a penny, and I should explain that there are certain variations in accounting practices. I mentioned it briefly.

Now, in looking over a list of some 26 companies in the United States, with 200,000 customers and over, for the year 6800
1938, as reported in "Statistics of Electric Utilities," by the Federal Power Commission for that year, I find that the Union Electric Company of Missouri was rated sixth with respect to this expense.

Mr. Odell: Before you go into another line of testimony, I have a little difficulty in seeing the relevancy of all this testimony dealing with the operations and work and policies of your credit and collections division, and I would like to have you point that out, if you will. 6801

—2,892—

Mr. Hamilton: Mr. Examiner, I don't intend to spend much time on this. It seems to me apparent that there is more to running an electric business than just generating hours of energy. We are presenting, and have presented in the case of the other groups, a picture of how these companies operate. Now, I wouldn't say that we have to spend much time on this, I don't want to spend much time on it, but this is just to complete the presentation, in any attempt to give a

6802 *Colloquy*

well-rounded picture of the way the company operates, and too, wherever possible, point out comparisons. That is what we have attempted to do.

The Examiner: Well, this seems to me to be just in line with the pictures you have presented of Washington and Cleveland.

Mr. Hamilton: That is correct.

The Examiner: And I don't think it is unreasonably long, Mr. Odell, and I think it is relevant.

6803 Mr. Odell: I wasn't putting it in the form of an objection. I was just asking a point of information.

Mr. Hamilton: I don't intend that it shall be extended at all, I am going to try and keep it within reasonable limits.

Bearing in mind, Mr. Stokes, that we don't want too much detail on this, state very briefly what the

—2,893—

practices of the Union Electric group are with respect to centralized purchasing?

6804 The Witness: The purchasing department of the Union Electric Company of Missouri, or what we have been calling the Union Electric group, purchases all material and supplies for the following subsidiaries, in addition to the requirements of the Union Electric Company of Missouri, as an operating company: Union Electric Company of Illinois, Lakeside Light & Power Company, Union Colliery Company, St. Louis & Belleville Electric Railway Company.

There are one or two other associated little companies, which the purchasing department would pur-

chase for as well, but they are not very active, and this is the chief group that actually uses much material.

The Department also purchases materials and supplies for the St. Louis County Gas Company, which is an affiliated company, and advises with and makes some purchases for the Iowa Union Electric Company and the Mississippi River Power Company, both subsidiaries.

The centralized purchasing is of considerable 6806
monetary importance to the group, some of which, for example, have occasion to buy a type of material very seldom, but which material may be used in great quantities by one of the other companies. As an individual buyer, they would not get a good price, and

—2,894—

centralized purchasing has very beneficial effects for some of the smaller groups.

Q. Does the operation of a centralized purchasing staff 6807
make possible a more rigid control of the quality of the articles purchased? A. Yes, it not only provides a closer control of quality than could be obtained by the individual groups, but the individual groups could not afford the specialized staff. For example, the staff of the department includes 7 buyers, two of whom are graduate electrical engineers and another of whom is a graduate mechanical engineer. In addition, they have a full time salesman who handles the ... of surplus materials and scrap; and a traffic clerk with 15 years' experience in transportation prob-

lems, and a statistician whose duties include market studies and the maintaining of price records.

Now, a small company, or one which does a smaller volume of purchasing, and a good example would be the Union Collieries Company, which runs a coal mine, and whose chief business is getting out coal, but who does use electrical equipment—well, their purchases of electrical equipment would be small in volume and they couldn't possibly maintain any of this type of help. So that it is quite an aid to
6809 those companies who get higher quality men than they could possibly afford for themselves.

The control of the quality of the goods is obtained without additional cost, either, because the division of this help, —2,895— scattered through the various groups, with respect to the quantity being purchased, makes the actual cost of purchasing considerably less.

I notice a figure which sticks in my mind as an example, of $535, billed last year to the steam heating division for purchasing work. Now, that is part of the company itself,
6810 but it was just an item that I happened to observe, where the estimated cost of that would be four or five times that amount, minimum.

Now, in the control of the quality of material, we take poles, for example, creosoted pine poles, and they are inspected on a blanket contract by an inspection agency for both Iowa Union Electric Company and Union Electric Company of Illinois. This service would be more expensive if their volumes were not included with that of the Union Electric Company of Missouri.

 6811

In looking into a new source of supply for mine timbers, this same inspection service was made available to the Union Colliery Company through the purchasing department's close contacts on poles. All line tools and safety devices purchased for the group, are routed through one of the operating divisions for inspection and test, thereby providing not only closer control of quality, for the subsidiaries, but also increasing the assurance of safe equipment. A small company wouldn't have facilities to test those things, they would have

 6812

to take them on the assumption that they were all right. That has to do with things like rubber gloves and devices that linemen use.

Q. Are you able to state any other advantages which accrue to the group out of the use of a centralized purchasing agency? A. Yes, there are many such advantages. The purchasing department can frequently be of special service because of its broad contacts and experience in analyzing proposed knowledge of transportation problems, and availability of engineering buyers for follow-up trips to manufacturing plants to inspect the equipment, and to expedite its shipment. Where the nature of equipment is highly technical, the services of the electrical engineering department are also loaned to the purchasing department for such inspection. 6813

For example, just before leaving here, or rather just before leaving St. Louis for here, I turned over one of my men to the purchasing department to send to the Westinghouse plant to inspect some switch gear that was just ready for shipment, that being of a very technical nature.

studies, but the Sales department has certain contacts with the rate department in the application of the rates.

—2,985—

Continuing—clerical and home service, and to a certain extent, advertising work.

Mr. Berry is 54 years old, and has been with the company 29 years, 5 of which have been in his present position.

His first job with the company was in 1911, as a salesman.

We have one rather unusual position, that of dealer sales counsellor. Mr. William P. Mackle holds that position. He correlates the merchandising and promotional activities of the company with those of other dealers, and represents the contact between the companies and the group of appliance dealers throughout the city. That work has been very successful.

Mr. Mackle is 43 years of age and has been with the Company for six years.

The work of the sales department is sufficiently important that I should like to describe just the leader in several of the major groups.

Mr. Paul W. McCormick is in charge of the industrial sales division. He is a man 41 year of age and a native of St. Louis, and has been an industrial engineer for the company since 1928.

Mr. Philip V. Brown is in charge of the residential sales work. He supervises the activities of 16 employes, including a group of women who are home lighting advisers. He is 48 years old and has been with the company for 19 years.

Mr. Robert L. Coe is in charge of the merchandising division. He is acting merchandise manager and supervises and

—2,986—

directs 36 employes of the division in the sale of merchandise at five stores.

In addition, Mr. Coe, with the help of an assistant, instructs the supervisers of the other merchandising division. He is 32 years of age, a native of St. Louis, and has been with the company for 11 years.

The rural service division is under Mr. Edgar J. Gildehaus, as acting manager of the rural service division. He is 33 years of age, a native of St. Louis, and has been in his present position for the last three or four years. 7022

Mr. Carter Lewis is in charge of the industrial and commercial lighting division, and is the acting head of the commercial sales division. His specialty is illuminating engineering. He is 42 years old and has lived in St. Louis all his life.

He not only went to Cornell University, but continued his education at Washington University. He has been with the company for 16 years, three of which have been in his present work.

The industrial heating division is under the direction of Taylor S. Carter, industrial heating engineer. He is 59 years old, and has been with the company for 19 years, mostly 7023 engaged in similar work.

Mr. Freund is in charge of the air conditioning division. He is development engineer in the air conditioning work. He

is 48 years old, has been with the company 19 years, 11 of which have been in the present work of air conditioning.

Mr. Freund has been very successful in promoting air conditioning work, of which St. Louis is justly proud. We do not make the installations, but we coordinate the work, and we do engineering work for customers and act as con-

7024 *Stanley Stokes—By Respondents—Direct*

tact agent between a customer and a contractor, and do everything possible to assist the promotion of air conditioning work.

The isolated plants division, and the heavy power applications are under the direction of Mr. Frederick V. Armistead, development engineer. He is 42 years of age and has been in the service of the company for 11 years, 5 of which have been in his present position.

Mr. Adolph I. Friemel has been engaged on various forms
7025 of rate application for the sales department. He analyzes to see whether the sales department is properly applying the rate to a particular case. He reports to Mr. Michel. He is 59 years old, has lived in St. Louis for 36 years, and has been with the company for 31 years, 12 in his present capacity.

I would like to mention Miss Kate Carroll. Miss Carroll supervises and directs the work of 38 employes in connection with sales contracts and other matters, and has been in the service of the company for 35 years. She is 51 years old and has lived in St. Louis all her life. She is a very responsible part of the sales department.

7026 —2,988—

The advertising work of that department is carried on by Mr. William K. Holland. He is 38 years old, a native of St. Louis, has lived in that city most of his life, and has worked for the company for seven years.

Mr. E. H. Tenney is in charge of steam power generation. He has been in the service of the company for 35 years, 22 of which are in his present position. He is 59 years old.

Mr. Tenney is one of the most responsible—has one of the most responsible jobs in the technical work in the company, and is at present engaged in carrying on, in addition

to the operation of the steam power plant department, he has one job at present at the Ashley Street station construction work representing $1,600,000, in addition to which he is a member of a committee of three—I am one of the members, he is one, and Mr. Miltenberger is the third—who are responsible for the design and general installation of the Venice plant which is now under construction.

Mr. Tenney's supervision covers 688 employes who are engaged in both construction and operation in the steam engineering division. He is the chief mechanical engineer 7028
and carries on engineering studies with respect to steam matters.

His assistant is Mr. G. V. Williamson, who is 39 years old, has been with the company 18 years. Mr. Williamson made one of the most rapid rates growth in the company of any young man with whom I have been acquainted. He is a very able engineer and has very responsible work at the

—2,989—

present time. He is Mr. Tenney's assistant. He has been in his present position for 15 years, and has been with the company for about 18 years. 7029

Also reporting to Mr. Tenney is the steam engineering and drafting division under the direction of Mr. Carl H. Rulfs. He is 45 years of age, born in St. Louis, and has lived there all his life.

He has been 24 years with the company, all in engineering and drafting work, and he is chief draftsman.

—2,990—

Mr. J. B. Wheeler, who also reports to Mr. Tenney, is the mechanical superintendent in charge of the Ashley Street

7030 *Stanley Stokes—By Respondents—Direct*

Station. He is 50 years of age, and has been with the company for 24 years.

One of my first jobs with the company was working with Mr. Wheeler, measuring some piling on the Page Avenue substation, and since that time Mr. Wheeler has occupied a number of positions. He is now in responsible charge of the Ashley Street station.

The mechanical superintendent in charge of the steam operations of the Cahokia power plant is Mr. Edward Lux-
7031 emberg. He is in charge of all steam work at the Cahokia station.

He is 63 years of age and has been with the company 32 years in various capacities.

Mr. Lester L. Kraft is the assistant mechanical superintendent, and is going to be—or is in charge of the work at Venice. He is in charge of Venice Plant No. 1, and is probably destined for charge of the new plant.

He is 44 years of age, has been with the company for 23 years.

The superintendent of supply service is Mark B. Covell.
7032 That is another way of stating in charge of all purchasing.

Mr. Covell reports directly to the management. He is 39 years of age, in charge of 43 employes in the purchasing division, and in addition has 75 employes in the building

division and 35 in the garage work, which is also under his supervision.

He has been with the company about 2 years, I should say.

We discussed the purchasing at some length previously. Mr. Covell is in charge of that work.

His assistant is Mr. Roy Goss, who has 43 employees reporting to him. He is 47 years of age and has held his present position for about 5 years. Previously he was a buyer. He has been with the company for 32 years.

Mr. E. H. Lewis is in charge of suburban operations of the Union Electric Company of Missouri, and is vice president of the St. Louis County Gas Company. He has approximately 1,000 employes under his supervision, and is responsible for the engineering, construction, maintenance, operation, service and customer's accounting in the suburban division— 7034
that is, the St. Louis County division—of the Union Electric Company of Missouri, and is in responsible charge of the operations of the St. Louis County Gas Company.

Mr. Lewis reports to the executive management of the company. He is 51 years of age, and has been in the employ of the company for 25 years.

He is a graduate of the University of Missouri. His first position with the company was cost analysis engineer.

I arranged to get Mr. Lewis his position with the company

because I had known him at college, and thought he was a 7035
very able man at the time. He made quite a development in the gas company operations out there. I think Mr. Lewis is entitled to great credit for the work he did in pioneering the gas plant, which is a leader of its kind in the country. It is not such a very large plant, but it is very efficient.

The financial officer of the suburban division is Mr. Dudley Sanford, with the title of assistant treasurer. He is 47 years of age, a graduate of Missouri University, a native Missourian. He has been in the employ of the company

for 21 years, and is treasurer of the St. Louis County Gas Company as well.

In addition to his regular duties as assistant treasurer, for the Electric division and treasurer of the Gas Company, he looks after all accident and claim work for the suburban division, and has charge of the St. Louis County stenographic, mailing and filing divisions, and acts as the representative of Mr. Lewis during the absence of Mr. Lewis.

He also has general supervision over the credit and col-
7037 lection work, billing and meter reading for the county. In his specific department there are 29 employees.

The supervisor of the St. Louis County billing division is Mr. William C. Gebelein. Mr. Gebelein is only 47 years old, but he has been with the company for 28 years. He was first employed in 1913 as a clerk. He has charge of all

—2,993—

billing matters for the county division, both gas and electric accounts.

Mr. Ned Crider is in charge of the distribution engineering for the suburban division. He is 50 years old, a graduate
7038 of Missouri University, a native Missourian, and has been with the company since 1914.

You will note that a very large percentage of the men in responsible charge of company matters are graduates of Missouri University. We have a pretty good percentage of them.

Mr. Albert L. Strother has charge of the construction and operation of both the electric and gas distribution systems in St. Louis County. That is, he is in direct charge of the distribution lines. He is a native Missourian, 48 years old, and also a graduate of Missouri University.

7039

He came with the company as cadet engineer just out of college, and is now superintendent of distribution and has been since 1926.

He has 399 employees under his direction.

Mr. Strother has been with the company for many years, because I have known him for more than 20 years. He used to work for me when he first came with the company.

Mr. Oscar Huffman is general foreman of the meter and installation division. He is 53 years of age, and has been with the company for 33 years, 23 of which have been in his

7040

present position. He came with the company as a lineman in 1907.

Mr. Henry G. Roeder is one of the older men with the company, who has been in actual outdoor line work for 27 years, 17 of which have been in his present position. He is 59 years of age.

By Mr. Hamilton:

Q. What is his function? A. He is one of three general foremen in charge of all overhead line crews for the suburban division. I mention him primarily because he is one of the men in responsible charge out there who has been in that particular line of work for so many years. That type of work is frequently regarded as more or less floating type of work. The linemen move around considerably. But the linemen for this group of companies are well paid and they are permanent, they don't move around.

7041

Mr. Harry Wolf is one of three general foremen in charge of all the gas main work. He is 53 years of age, has been

with the company for 33 years, 23 of which have been in his present position.

He is superintendent in charge of gas main construction.

Mr. W. L. Jones, Walter L. Jones, is sales manager for the St. Louis County division of the Union Electric Company of Missouri, and the St. Louis County Gas Company. He is a native Missourian, has been in the employ of the company for 20 years, of which 17 years have been in his present position.

7043 —2,995—

He reported to me as manager of the De Soto office at one time. That was one of the cities in the outlying plants division, and then later he was superintendent of the St. Charles division. In his present position as sales manager he directs the activities of 104 employees, and also has connection with the advertising work as well as the sales work.

The superintendent of sub-stations for the St. Louis County division is Mr. James S. Shaw. He has 60 employees under his general direction, and has charge of the maintenance and operation of the County major sub-stations.

7044 The outlying divisions group of the company are now operated under the general direction of the St. Louis County division, but the superintendent of this group of properties is Mr. Herbert M. Patton.

—2,996—

He reports to Mr. Lewis, who has been previously described. He has complete charge of the operations of the outlying plants group. He is 55 years old and in 1924 he came with the present group of companies and was made sales manager of the outlying plants at that time.

He reported to me then and has since become manager of that group, with which I do not now have any further connection.

There are 170 employes in the group, and a group of division managers for the various divisions such as Franklin County, St. Charles County, Jefferson County, St. Francois County—all of whom report to Mr. Patton. The individual managers of the various properties I believe I will not describe, I will not mention them in detail, although they are all responsible positions and have a good many employes 7046 reporting to them.

The engineering work for the gas company is under the direction of Owen R. Allgeier, who is 50 years old and started with the company in 1916.

He has charge of all engineering matters for the gas company, of the St. Louis County Gas Company, and reports to Mr. Lewis.

The operation of the gas company plant, that is, the plant of the St. Louis County Gas Company, which is located at Shrewsbury, in St. Louis County, is under the direction of Frank C. Meyers. He is 56 years old and has 7047 been with the St. Louis County Gas Company since 1918.

—2,997—

The operations of the East St. Louis Division, that is, in and around the city of East St. Louis, are very closely tied in with St. Louis operations. As we previously pointed out, the load dispatcher handles the whole system as though it were one. But they do have, in the Union Electric Company of Illinois, separate supervisers. The manager of the East St. Louis and Alton Divisions of Union Electric Com-

pany of Illinois is Mr. George W. Welsh. He is directly in charge of these two divisions, that is, the East St. Louis and Alton Divisions of that company. They operate in and around East St. Louis and up as far north as Alton, about 20 miles north, including Hartford and surrounding territory.

There are no power plants or power generations under his supervision because that district acquires its power from the plants which we have previously described.

7049 To give an idea of Mr. Welsh's responsibilities, the following superintendents report to him: superintendent of electric department (all refers to the East St. Louis group and all to the Union Electric Company of Illinois)— superintendent of electric department; superintendent of automotive equipment; safety engineer; power sales engineer; assistant treasurer; manager of the Alton office; merchandise manager; and claims assistants.

That gives you an idea of the extent of his work.

He is 59 years of age and has been with the company for

—2,998—

7050 26 years.

His assistant in the East St. Louis and Alton Divisions is Mr. George P. May, who is actively engaged in the operations of the East St. Louis properties as we refer to them. He is 51 years of age, has been with the company 26 years, 5 of which are in his present position.

He again has a superintendent of electrical matters, Mr. H. J. A. Gerard, who is superintendent of electrical department for the Union Electric Company of Illinois.

He is 58 years of age and has been with the company for 26 years, 8 in his present position.

 7051

An electrical engineer with the company is Mr. George E. Sykes, and by the "company" I refer to the Union Electric Company of Illinois. He is 48 years old, has been with the company for 25 years, 13 in his present position.

The assistant treasurer of the Union Electric Company of Illinois is Mr. Thomas W. Gregory. He carries on all the activities that are ordinarily associated with that job, such as the signing of checks and vouchers.

Mr. Gregory is 68 years old, a native of Illinois, and has been with the company for 38 years, 7 of which have 7052
been in his present position.

He has had various positions, most of his life he has been engaged with the railway companies on the East Side, which properties have been disposed of and are no longer connected with the Union Electric Group.

—2,999—

Mr. Frank L. Rearden is an assistant treasurer. He supervises as well the billing division, credit and collection division in East St. Louis, and the payroll division for both East St. Louis and Alton. That is for the Union Electric Company of Illinois. 7053

He is 65 years of age and has been 31 years with the company, 10 in his present position.

He, as a rule, signs all the checks and vouchers, and when he is absent, Mr. Gregory does that work.

Q. Very briefly, now, the principal operators and executives connected with the operation of the Keokuk District. A. The Keokuk District properties are operated as a separate unit under the general supervision of the main part of the group, that is to say, the load dispatcher and all other activi-

7054 *Stanley Stokes—By Respondents—Direct*

ties like that, handle them as well as they handle any other parts of the group. But they have their own employees because that is the Mississippi River Power Company up there as well as the Iowa Union Electric Company.

Each of the local business offices in the Keokuk District is complete and has delegated to it sufficient authority so that all ordinary business transactions with the customer may be handled without delay.

Matters of policy are always referred through the vice
7055 president up there to the St. Louis executives.

—3,000—

There are 239 employes in the division, of which 134 are employed by the Mississipi River Power Company, and 105 by the Iowa Union Electric Company.

Mr. L. E. Dickinson is the vice president in charge of the Mississippi River Power Company and also vice president of the Iowa Union Electric Company, and is in direct charge of all the operations in that vicinity.

He is 60 years of age, has been in the employ of the company for 27 years. His first position was that of system
7056 operator. The chief assistant to Mr. Dickinson is Mr. Paul L. Mercer. He is in general charge of the division in Mr. Dickinson's absence.

He is 41 years of age and has been with the company for 18 years. He first started as hydraulic assistant and has had various positions.

He is a graduate of the State University of Iowa in 1921. He later got his Master's degree in 1922.

The assistant treasurer of that group of companies up there is Mr. Earl F. Doyle.

—3,001—

7057

He is 46 years old, and has been with the company for 25 years, 15 of which have been in his present position.

He has had varying positions, starting with the job of cashier.

The hydraulic engineer for the Mississippi River Power Company is Mr. Clarence H. Herolfson, He is 51 years of age, and has been with the company for 27 years, 16 of which have been in his present position.

Mr. A. K. Hillemeier is in charge of the electrical engineering for that group, that is, the Mississippi River Power Company and the Iowa Union Electric Company. He has been with the company for 16 years, 13 in his present position. 7058

He is 42 years of age.

The general superintendent of the Mississippi River Power Company is Mr. Frank J. Venning. He has charge of the power plant itself. He is 59 years of age, and has been with the company for 27 years.

The mechanical superintendent at the Mississippi River Power Company is Fred H. Rennert; he is in charge of operation and maintenance of the water wheels and all mechanical operations. 7059

He is 56 years of age, has been with the company 23 years, 13 of which have been in his present position.

The local manager of the Keokuk division of the Iowa Union Electric Company is Mr. G. W. Carlson. He is in charge of the operation of the local electrical distribution in

Keokuk and surrounding territory. He also supervises the gas generation and distribution system at Keokuk for the Keokuk Gas Company.

Local representatives at Hamilton and Warsaw, Illinois, nd Montrose, Iowa, report to him.

He has 41 electric and 13 gas employees reporting to im.

He is 54 years of age, has been with the company for 27 ears, 15 of which have been in his present position.

The Union Colliery Company and the St. Louis & Belle-ille Electric Railway Company are under the direction of Ir. Edgar F. Stevens. He is vice president of the Union olliery Company and the St. Louis & Belleville Electric ailway Company.

He is 50 years of age, has lived in Missouri for the past 7 years, has been with the company for 26 years, and has ad his present position for the past 5 years.

There are 702 employees under his supervision. He was rst employed in 1914 as clerk in the Secretary and Treas-rer's office. Later he was engaged in valuation work and ecame auditor of the Union Colliery Company in 1917.

Since then he has been fuel agent, and during the year 92[illegible] he was general manager of the Union Colliery Com-any, and in 1929 was made vice president of both the Union olliery Company and the St. Louis and Belleville Electric ailway Company. He is in active charge of the operations

f the Union Colliery Company, which is the coal mining ompany; as well as the railway company, which operates a ery short railway line, and which is mostly engaged in haul-ng coal.

Mr. Stevens is a very able operator.

7063

The assistant to Mr. Stevens in the Union Colliery Company and in the St. Louis & Belleville Electric Railway Company, is Mr. Harvey T. Hildebrand. He is 43 years of age and has been employed by the company for 16 years.

Mr. Edward Leming is general superintendent in charge of the operation and production at the Kathleen Mine of the Union Colliery Company. He is 50 years of age, has been employed by the company for 25 years, and has had his present position for the past 12 years.

7064

He resides at Dowell, Illinois, at which point the mine is located.

Mr. Theodore G. Dyer is superintendent of the St. Louis & Belleville Electric Railway Company, and has charge of its operations. He reports to Mr. Stevens.

He is 52 years old, and has been with the company 25 years, and has had his present position for the past 11 years.

He lives in East St. Louis. He has 67 employees under his direction.

7065

The manager of the Union Electric Land & Development Company, and the Lakeside Light and Power Company, is Mr. Gordon E. Crosby. He makes his headquarters at

—3,004—

Lakeside, Missouri, which is essentially the location of the Lake of the Ozarks—that is, that is their mailing address—and is right near the Bagnell Dam.

He is 46 years old, and has been with the company 10 years. He handles the land sales and farm rentals for a large amount of excess land which this company, the Union Electric Land & Development Company, holds as a result of the

construction of the Lake of the Ozarks, and the Bagnell Dam.

There are some recreational facilities involved with the Lake of the Ozarks, and Mr. Crosby has charge of those as well as the Holiday House, which is a hotel, and the Casino, a restaurant, and a fleet of excursion boats and other recreational facilities.

He also manages the operation of the Lakeside Light & Power Company, which is a small company doing business
7067 around the lake, and which has been previously described.

Mr. Hamilton: I think this is an adequate stopping point.

The Examiner: All right, we will continue tomorrow morning at 10 o'clock.

(Whereupon, at 4:35 o'clock p. m., a recess was taken until 10 o'clock a. m., Tuesday, October 29, 1940.)

—3,005—

7068

7069

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

7070

Hearing Room 1101,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Tuesday, October 29, 1940.

Met, pursuant to adjournment, at 10 o'clock a.m.

7071

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD and HERMAN ODELL, Attorneys for the Securities and Exchange Commission.

—3,006—

7072 *John A. Woodbridge—By Respondents—Direct*

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Browning: If the Examiner please, we should like to interrupt Mr. Stokes' testimony to put Mr. Woodbridge on the stand.

The Examiner: All right.

Whereupon, JOHN A. WOODBRIDGE, called as a witness on behalf of the Respondents, having been first duly sworn, was
7073 examined and testified as follows:

Direct Examination by Mr. Browning:

Q. Will you give us your full name, Mr. Woodbridge? A. John A. Woodbridge.

Q. And your residence? A. I reside at 9928 Litzinger Road, St. Louis County, Missouri.

Q. Are you a vice president of the Union Electric Company of Missouri? A. I am.

Q. Now will you tell us briefly about your personal history and experience? A. I was born in the City of New
7074 York in 1903.

My early days were spent in northern Westchester County, where I attended the public schools through the grades and high school, and then graduated from the Phil-

—3,007—

lips Exeter Academy at Exeter, New Hampshire, in 1920.

From there I went to Amherst College and received a Bachelor of Arts degree in 1924. That fall I attended Columbia University Law School and received an LL.B. from there in 1927.

 7075

In the fall of that year I became associated with the law firm of Sullivan and Cromwell, New York City, and was admitted to the New York Bar in April, 1929.

While I was at Sullivan and Cromwell, a large portion of my work from the very beginning was in connection with the affairs of the North American Company and its various subsidiaries. A good deal of that was routine, day-to-day work, but a very substantial part was in connection with security issues of the system, as well as security issues of other companies. 7076

One of the early issues I worked on was the bond issue of the Union Electric Company of Missouri in 1932. There were two issues of bonds in that year on which I worked, and another one following in 1933, under the old General Mortgage of the Union Electric Company of Missouri.

I did a great deal of the legal work in connection with the bond and preferred stock issues of the Cleveland Electric Illuminating Company, another subsidiary of the North American Company; with bond issues of the Potomac Electric Power Company, Wisconsin Electric Power Company, 7077

Wisconsin Gas & Electric Company, Wisconsin-Michigan Power Company.

I also worked on bond issues for the Iowa Power & Light Company and the Missouri Power & Light Company.

One of the largest financings, and one of the most difficult that I worked on, was the Union Electric bond and note financing, in 1937, and then there was another issue I worked on in 1938 for the then Electric Company in connection with its preferred stock issue. The last security issue that I

spent a great deal of time on when I was with Sullivan and Cromwell, was the North American financing early in 1939, which involved the issue of $105,000,000 of debentures and preferred stock.

In May of 1939, I went to St. Louis with Dr. William McClellan; Mr. McClellan was former president of the Potomac Electric Power Company here in Washington. Also Mr. Edward T. Gushee, who was at the time vice president of the Detroit Edison Company. The three of us went to
7079 St. Louis as the new executive management of the Union Electric Company of Missouri, Dr. McClellan as president; Mr. Gushee as executive vice president, and myself as general vice president,—and I have been there, performing the duties of that office, since.

Q. You were at Sullivan and Cromwell continuously from 1927 to 1939? A. Yes.

—3,009—

Oh, I would like to add that I became admitted to the Missouri Bar about a year ago, and just last month formally
7080 enrolled before the Supreme Court of Missouri.

Q. In the course of your financing work, did you have any contact with Commission regulation? A. Yes, practically every security issue that we worked on was under the jurisdiction of one State Commission or another. I believe there was one exception. The Iowa Power & Light Company I don't believe was subject to State jurisdiction. But in all these other cases, we had the problems in connection with the State regulation, in connection with security issues and other transactions that were incident to the particular job.

 7081

Q. As part of the duties of your present position, do you have any contact with matters involving State Commission regulation? A. Yes, that is one of the functions of my office, which covers a number of different branches, not particularly clearly defined.

However, the supervision over the regulatory work with both State and Federal Commissions, is under my province.

In addition to that I have supervision over all the legal work of the company, and tax work, and various other things of a corporate nature. 7082

—3,010—

Q. Are the companies in the Union Group subject to State Commission regulation? A. Without exception, as far as electric and gas utilities are concerned, the Missouri companies have been under the supervision of the Missouri Public Service Commission since 1913, and the subsidiary companies operating in Illinois have been under the supervision of the Illinois Commerce Commission or its predecessor commission, since January 1, 1914.

There is one subsidiary, Iowa Union Electric Company, which operates both in Illinois and Iowa, and as to its local 7083
Iowa operations, there is no Commission in Iowa which really serves the purpose of a State Commission. There is a commission there, the Iowa Board of Railroad Commissioners, which has to do with the placing of lines outside of cities and towns. That, however, is more in the nature of location of lines and the use of the highways, but the cities and towns in Iowa regulate the utilities within their jurisdictions as to rates.

I say without exception, because the Iowa Union Electric Company is subject to the Illinois Commerce Commission.

7084 Q. Do the cities and towns in Iowa also regulate service by the utility? A. They do, to a certain extent. Any questions of dependability of service, the installation of wires and underground conduits—all such matters are regulated by the City Council.

—3,011—

Q. Can you give us some idea of the staff of the Missouri Public Service Commission? A. The Missouri Public Service Commission consists of five Commissioners, a Secretary, a
7085 Chief Engineer, a Chief Accountant, a Chief Rate Expert, General Counsel, and a substantially large staff of engineers, accountants, auditors, and other employees. The total personnel of the Missouri Commission is about 134.

Q. What is the organization of the Illinois Commerce Commission? A. The Illinois Commerce Commission also has five Commissioners, although the office of one Commissioner is vacant at the present time. They have a Commission Secretary, who has two assistant secretaries; they have a Chief Accountant, Chief Engineer, and a similarly large staff of accountants, engineers, experts, and other employees.
7086 It was organized in its present form around 1914, and, including the Commissioners, I believe its personnel runs around 164 or 165.

Q. Are the companies in the Union Group subject to regulation as to their rates? A. They are. The companies in the Union Group have been in about 65 different rate proceedings before the Commission. The practice on these rate matters in the State of Missouri has never resulted in any litigation over the results of the Commission's findings.

—3,012—

However, the companies have not been ordered to reduce rates a single time in Missouri. Many reductions in rates come purely as a result of informal discussions with the Commission and its staff, or during negotiations during the pendency of a rate proceeding.

It is interesting in this connection to take up, as an example, the case where the company had made a reduction of something over $700,000 a year. The City of St. Louis entered its appearance before the Commission and contended that the company hadn't made a large enough reduction. So 7088
a valuation case started which lasted over quite a number of years.

Finally, in 1937, the Commission completed its case and fixed a valuation or a rate base for the Union Electric Company of Missouri's properties, of $125,000,000.

During the time that the proceeding was going on, the company had made substantial rate reductions in the interim in an amount more than the city had asked for in the first place. So that the case resulted in no order on rates, and didn't take up the question of a fair rate of return.

The city agreed that the company was not earning an 7089
excessive rate of return.

The Examiner: Have you the date on which that proceeding started?

The Witness: I believe I have, sir.

—3,013—

In February, 1928, at the invitation of the Commission, representatives of the Company and of the City started conferences with a view to obtaining lower rates, and as a result of those conferences, the

7090 *Colloquy*

rates were reduced on May 7, 1928, to the extent of $706,467 per annum, and they were promptly approved by the Commission, effective June 1, 1928.

That actually was the largest single rate reduction up to that time.

The City claimed that there should be an additional reduction of $700,000 a year, and they filed a request in that year that the Commission audit the company's records and require the company to show
7091 cause why a further reduction should not be made.

In July of that year the Commission ordered the accountants to audit the books of the company, and they started in with that audit in August. That audit lasted until September, 1930, when it was completed. While that was in progress, a further reduction of some $16,500 was made.

Between October, 1930, and March, 1931, there were hearings held, and following those hearings, on April 27, 1931, there was a further rate reduction of $375,000 a year. No decision had come down at all
7092 up to that time.

Then in May of 1931, the Commission issued an order directing its engineering department to make an inventory and appraisal of the properties. You see, the previous order had just been an order for an

audit. These cases were all consolidated. The inventory and appraisal commenced in June of 1931, and was prepared in great detail, and was finally filed in March of 1936.

The accountants began new audits to bring their previous ones up to date, and their report was filed in April of 1936.

During that five-year period the appraisal and audits were in progress, the companies involved, that is, the Union Electric Company of Missouri and two small subsidiaries, filed ten revisions in their rates, resulting in rate reductions approximating in the aggregate $1,785,000 a year.

An interesting factor in connection with the hear- 7094
ings on that was that all of the direct testimony of the witnesses on both sides, both for the company and whatever the city wanted to put in, and for the Commission, was reduced to writing before the hearing. I am not sure, but I think that is the first time that that was done in Missouri. At the hearing, counsel were limited to cross-examination of this direct testimony, which, of course, shortened the hearing tremendously. I believe that hearing actually lasted only ten days, and the final result of the Commission's order was to find the fair value of the properties at 7095
December 31, 1935, to be $125,000,000 for the Union Electric Company of Missouri; $850,000 for the Cupples Station Light, Heat & Power Company; and $32,500 for St. Charles Electric Light & Power Company.

—3,015—

At the same time, the Commission prescribed the depreciation allowance to be set up each year as $2,012,000 on the electric properties, plus 3 per cent. on net additions since April 30, 1935; and $73,000 a

7096 *John A. Woodbridge—By Respondents—Direct*

year on the steam properties, plus 2 per cent. on steam additions.

Mr. Browning: Does that answer your question, Mr. Examiner?

The Examiner: I think so. As I summarize what the witness has said, there were some preliminary negotiations and an order for the preliminary examination of the books; then in 1932 an order was entered calling for appraisals; and then the final action

7097 of the Commission was in 1937?

The Witness: That is right.

The Examiner: All right, that answers my question.

Mr. Browning: I would like to have marked for identification as Respondents' Exhibit 56, a table entitled, "Union Electric Company of Missouri—Rate Reductions from 1918 to 1940", which covers two sheets, and to which is attached a third sheet entitled,

7098 "Subsidiaries of Union Electric Company of Missouri—Rate Reductions from 1928 to 1940".

The Examiner: The table will be so marked.

(The document referred to was marked "Respondents' Exhibit No. 56 for identification".)

By Mr. Browning:

Q. Mr. Woodbridge, was this material compiled under your

direction? A. It was.

7099

Q. And was it taken from the books and records of the several companies? A. Yes.

Mr. Browning: I offer it in evidence as Respondents' Exhibit 56.

Mr. Odell: No objection.

The Examiner: Very well, the table is now admitted in evidence under the number assigned.

(Respondents' Exhibit No. 56 was received in evidence.)

7100

Mr. Browning: I think that the table speaks for itself, Mr. Examiner, so that no particular examination is necessary.

The Witness: I would like to point out in connection with the table that since 1919, there were 51 different voluntary rate reductions on the part of the Missouri companies that aggregated $5,300,000; and that of the subsidiaries in Illinois, the rate reductions since 1928 comprise 31 voluntary reductions, amounting to more than $700,000.

I believe that is the subsidiaries both in Illinois, 7101
Missouri, and Iowa.

The Illinois practice on these rates is quite similar to Missouri practice now. Many times there are negotiations with the Commission so that no actual rate proceeding takes place at all. We have had a

few such instances this year.

In Alton and East St. Louis, there were rate reductions in the early part of this year, following conferences with the Commission's staff, and just

the early part of this month there was a further rate reduction in some small territory north of Alton. Hartford, Illinois, was one of the places that has been reduced just within the last month.

y Mr. Browning:

Q. You have testified that Union Electric Company of issouri has never been ordered to reduce its rates? A. That right.

Q. Has any subsidiary of Union Electric Company of issouri been ordered to reduce its rates since it became a rt of the North American system? A. No, there has not en a single case of that. There were one or two cases ior to the time of the companies becoming a part of the stem, but not since.

Q. Have the companies ever had any litigation over the gulatory powers of the Missouri Public Service Commis-on? A. I would say no. There have only been four cases here orders of the Commission have been appealed to the urts, and those involved, in one case the question of a fee yable to the Commission on a bond issue on refunding. e Missouri Commission collects a fee on the issue of bonds, t that doesn't apply to a refunding issue. In that case the

mmission claimed that since the securities which were re-ded had been issued prior to the Commission coming into stence, that is, prior to 1913, they should collect a fee the refunding issue. I have forgotten the amount of fee olved, but that case was carried to the courts, and the rts decided it in favor of the company.

Of the other cases, one involved the right to acquire stock of another utility; another involved the question of the duty of the company to service a customer suspected of diverting current; and the fourth case involved some question regarding construction of line extensions.

Q. And those four cases are the only cases of litigation in the 27 years since the Missouri Commission started? A. That is correct.

Q. Now as to cases before the Commission itself, could you give us some data on cases before the Missouri Commission 7106 in which companies of the Union Group have been involved? A. These cover a very broad range. The total number of cases in which the Union Electric Company of Missouri and its Missouri subsidiaries were involved, have amounted to 232 over this period.

There were 60 rate cases; 3 valuation cases; 5 cases in connection with construction of property alone; 13 cases involving construction of property and approval of franchises; 4 cases involving solely the question of approval of franchises; 26 cases involving the acquisition and sale of —3,019— 7107 properties; 10 cases concerning the acquisition of securities; 34 on the issue of securities; 5 on reorganizations; 7 on standards of service; 31 on the question of service to all applicants generally; and 8 miscellaneous.

Included in the 232 cases were 26 cases in which the St. Louis County Gas Company, which is not a subsidiary of the Union Company, was involved. Five of those were rate cases, one a valuation case, three concerning approval of franchises, 13 on issue of securities, 3 on standards of service, and one miscellaneous.

7108

Q. When you say "cases", that refers to proceedings before the Commission, I take it? A. That refers to formal docketed proceedings

Q. It does not indicate any disagreement between the companies and the Commission necessarily? A. Not necessarily.

Q. Now will you give us the same data with regard to Illinois? A. In Illinois there have been a total of 465 cases: 45 on rates; 90 on contracts with other utilities; 1 on valua-

7109 tion; 53 on construction of properties; 12 on the acquisition and sale of properties; 59 on the sale of property alone; 58 on the issue of securities; 1 on reorganizations; 28 on standards of service; 10 on service to all applicants; 31 on aban-

donment of service—that is mostly in connection with railways; 3 on examination of accounts; 8 on financial policies; 10 on contracts with affiliated interests; 8 on records outside of the State; 23 on grade crossings; 10 on crossing protection; and 15 miscellaneous.

Q. Has any company in the Union Group ever appealed

7110 to the court from any order of the Illinois Commerce Commission since it first commenced functioning? A. Not since it became a part of the system.

Q. Do the Missouri and Illinois Commissions exercise jurisdiction and supervision over the accounts and records of the several companies? A. Yes. In Missouri the companies have complied with the accounting regulations of the Missouri Commission for approximately 25 years; and in Illinois, I think for about 21 years.

The Commissions both have Uniform Systems of Accounts now, which, of course, tie in very closely with the

Uniform System prescribed by the Federal Power Commission.

Q. Do the Missouri and Illinois Commissions exercise jurisdiction over the property and franchises of the companies? A. Yes, they do. As was indicated in the data with regard to the type of cases, we have had quite a number of cases in that regard.

In order to start construction of a plant or to enter any

—3,021—

7112

new section of territory where the companies haven't operated before, we have to get the approval of the Commission.

Q. This is the Missouri Commission you are now speaking of? A. Yes. As a matter of fact, it applies to both Commissions.

For example, there was a case in Missouri where the Union Electric Company of Missouri requested authority to construct a transmission line to a State park. That was about the most recent case in Missouri where we had to get the Commission's approval to extend the transmission line.

In 1929, there was perhaps the largest case in which the 7113
Union Electric Company of Missouri was involved on this type of question. That was when they were constructing the Osage hydro-electric project, down at the Lake of the Ozarks, and in that connection the company had to acquire a certificate of convenience and necessity to operate the project and acquire the rights and properties of the company that had commenced the construction.

Q. Is Commission authority required to exercise franchise rights? A. Yes. For some time, even though you get a franchise from a local community in Missouri, that fran-

7114 chise is subject to the approval of the Commission, and you have to get their approval before you can operate.

—3,022—

A recent case of that kind was where the company requested authority to start construction in the village of Moselle, Missouri. It had already acquired a franchise ordinance from the city, but still we had to go to the Commission before we could commence operations.

7115 Now a utility company in Missouri must submit all copies of new franchises, even though they merely involve renewal of franchises previously obtained.

The Missouri Commission, in connection with these extensions, sets up, of course, the standards of construction, requires that the standards set up by the United States Bureau of Standards and the general orders of the Commission be complied with, so that the public will not be endangered, and there will be no interference with lines of other companies.

Q. You say that the same situation obtains in Illinois?

7116 A. Yes. The most recent case of that happened this year. It was decided that we would build an addition to the generating capacity at the Venice Site on the East side of the Mississippi River over in Illinois.

I had some question myself as to whether or not the approval of the Commission was actually required in that case, because it might have been considered mere addition to an existing plant. However, the plans called for the actual construction of a separated plant on the same piece of property. So we went to the Commission and asked their author-

 7117

ity to build that plant, and hearings were held on that, and

—3,023—

the authority granted.

Q. Now in connection with those hearings, did the Illinois Commission receive testimony regarding the necessity of the plant, the needs for additional capacity? A. Oh, yes. The chief engineer in charge of the power plants, Mr. Tenney, was the principal witness in that case, and testimony in that connection was put in.

7118

Q. Do the companies secure Commission authorization for the acquisition or sale of property? A. Yes. Before you can sell any property used or useful in public service, you have to get the approval of the Missouri Commission. Usually that would involve the sale by one utility to another, and consequently you would have both companies joining in the application, one to ask approval for the sale, and the other to ask approval for the acquisition. A recent example of that was in 1937. The Mississippi River Power Company, which owns the hydro-electric dam up in the Mississippi River near Keokuk, had a subsidiary, the Missouri Transmission Company, which owned the transmission lines in Missouri, which connected the operations up there with operations in Missouri. We wished to eliminate that situation, and in order to transfer the assets of the subsidiary to the Mississippi River Power Company, both companies had to apply to the Missouri Commission for approval. This not only applies to physical properties, but in order

7119

—3,024—

to acquire securities of another public utility company, the approval of the Commission must be obtained.

7120 *John A. Woodbridge—By Respondents—Direct*

Also, in 1937, the Union Electric Company of Missouri was acquiring additional stock—not additional stock but stock of the Keokuk Electric Company, which was a subsidiary prior to that time, and that case had to go before the Missouri Commission for authority.

Commission approval is also necessary in case of a company other than a public utility acquiring 10 per cent. or more of the stock of a public utility. Whenever the Union Electric Company in the past has issued and sold common
7121 stock, or our affiliated company, the St. Louis County Gas Company, has issued and sold common stock to the North American Company, the North American Company has had to apply to the Missouri Commission to obtain approval for the acquisition.

The most recent case of that was in May of this year, when the St. Louis County Gas Company sought approval to issue $1,100,000 of additional common stock which was to be bought by the North American Company. Informal conversations were had with the Commission before application was filed, and that was approved, as well as the appli-
7122 cation of the North American Company to acquire the additional stock. That case, of course, was also subject to the jurisdiction of the Securities and Exchange Commission.

Q. What is the situation in Illinois? A. Illinois has

—3,025—

very extensive jurisdiction over the acquisition and sale of property. It goes into more detail, even, than the Missouri Commission.

For example, in 1939, last year, the St. Louis & Belleville Electric Railway Company, a subsidiary, had to go to

7123

the Illinois Commission for authority to purchase some equipment from the Union Electric Company of Illinois. That equipment, as I recall, consisted of some rotary converters which had previously been leased to the St. Louis & Belleville Railway Company, which are used in the operation of its electric freight railway line, and Commission approval had to be obtained by both parties on that transaction.

I mentioned before the acquisition by the Union Company of the Keokuk Electric stock going before the Missouri Commission. The approval of the Illinois Commission was 7124
also necessary on that case, because the Keokuk Electric Company, which was an Illinois corporation, was acquiring all of the property and franchises of the Dallas City Light Company, which was an Illinois company, and Fort Madison Electric Company, which was an Iowa company, and all the details of that transaction had to go before the Illinois Commission.

The Commission has jurisdiction over the assignment, lease, mortgage, sale or encumbrance to public utility properties.

Again, the St. Louis & Belleville Electric Railway Company merely desired to sell a small piece of property early 7125
this year, and it had to go to the Commission for approval

to do that.

Q. May the companies issue securities without the approval of the Missouri or Illinois Commissions? A. They can issue short-term notes. The requirement in Missouri is one year or less, and I think it is the same in Illinois. But for anything else, stocks, bonds or other evidences of indebted-

7126 *John A. Woodbridge—By Respondents—Direct*

ness, the companies have to go to the Commissions for authority, and have done so on quite a number of occasions.

In Missouri, from time to time, when the company has not had an issue for some time, or when the Commission basis for securities has been on a refunding matter, the companies have made the practice of filing an application with the Commission setting forth all their expenditures for the last five years, so that those expenditures will be before the Commission and won't be lost to the company in case they
7127 should wish to come along later and ask for specific approval of securities.

Q. The Missouri companies are permitted to issue securities only against property additions or to refund securities previously outstanding? A. In substance that is correct. Those issues can be either prospective or based on past transactions. If you are asking authority to issue securities for the purpose of acquisition of properties, then, of course, you have to go into considerable detail and support the applica-

tion with a description of the properties you are going to
7128 acquire or construct. You just can't issue securities for the acquisition or construction of unnamed properties. When the properties have already been constructed, then you can issue securities to reimburse the treasury for those expenditures.

The same thing is true of refunding.

Q. Does the Commission exercise authority over the creation of liens on property? A. Yes, it does. No lien can be created on the properties without the consent of the Commission. I shouldn't say "no lien", as that is probably too broad,

7129

because, of course, you can have mechanic's liens and things like that, which are more or less involuntary.

Q. Or if you don't pay your taxes? A. Or if you don't pay your taxes, yes. We try to pay our taxes unless they are too exorbitant.

In 1937, for example, the Union Electric Company of Missouri obtained the Missouri Commission's approval for the creation of its present mortgage, the mortgage of July 1, 1937, under which the first mortgage and collateral trust bonds are now outstanding.

7130

The only case previous to that, I think, in Missouri, was in 1924, when the general mortgage was issued, and that served as the financing vehicle from 1924 up to 1937.

—3,028—

Q. Does the Missouri Commission exercise jurisdiction over reorganization plans? A. Yes. There have been two reorganizations of the Union Electric Company itself which have been before the Commission, one in 1917 and one in 1922, and the latter one involved the filing of four separate applications, and the entire transaction was subject to the approval of the Commission.

7131

Q. Turning now to the Illinois Commission, does it exercise authority over the issuance of securities? A. It does, except, as I said before, for the short-term notes, with a maturity of not more than 12 months.

The largest issue which has been involved before the Illinois Commission was in May of 1937, where authority was requested for the issue of $22,000,000 of 3¾ per cent. bonds of the Union Electric Company of Illinois.

7132 *John A. Woodbridge—By Respondents—Direct*

This Commission also has jurisdiction over the creation of liens, and in connection with that bond issue which I just mentioned, specific approval to the creation of the mortgage and the creation of the lien on the properties was also required.

Q. Does the Commission exercise jurisdiction over mergers of public utilities? A. Yes. The $22,000,000 issue was made by the surviving company in a merger which took place at that time. The company was the old East St. Louis Light
7133 & Power Company, which survived the merger as Union Elec-

—3,029—

tric Company of Illinois, and all the details of that merger were approved by the Illinois Commerce Commission.

I might say in that connection that each of the constituent companies, other than the East St. Louis Light & Power Company, in connection with the merger, had to obtain authority from the Illinois Commission to issue additional stock. These companies weren't actually issuing the stock themselves, but it was desired to have an $18,000,000 com-
7134 mon capital of the resulting company. That was larger than the combined capital of the constituent companies in the merger.

Q. Why was it larger? A. Well, it was just a fact that it was larger. Of course, the constituent companies had fairly substantial surplus. So in order to make up the difference between the aggregate capitalization of the constituent companies and the final capitalization, an amount of surplus was capitalized, but in order to issue stock against that, the constituent companies had to get authority to issue the

stock first, so as to comply with that Commission rule. It is a statutory rule.

Q. Does the Missouri Commission issue orders determining standards of service? A. Yes. The first orders in this connection were issued in 1915, fixing standards of service, regulating meter readings and billings, disconnection of service, and limitations on the amount of deposits that could

be obtained from customers as surety for their accounts, fixing the interest rate on such deposits. 7136

This order also covered voltage regulation and the operation of electric plants, accuracy of meters, and fixing periods of tests, and the maintenance of facilities to make such tests.

A few years ago, in 1938, the Commission ordered an investigation and hearing on billing practices of all utilities, and detailed statements of billing practices were submitted at that hearing, and as a result the Commission issued an order which required the utilities to show on their bills the necessary information to enable customers to understand how those bills were made up, so that the customer himself could check the bills. The charge for service had to be stated separately from any other charge, that is, charges for appliances or for sales taxes, and things of that character. 7137

Q. Does the Illinois Commission prescribe rules covering standards of service? A. Yes, they have very detailed rules.

In 1914, general orders were issued covering frequency and voltage regulation, billing requirements, meter and station records, fixing of periods of tests of meters, location of meters, and extension of lines, and various other detailed matters.

Q. Does the Commission have jurisdiction over the aban-

—3,031—

donment and discontinuance of utility service? A. The Commission does. We, of course, in our system have not had occasion to seek authority to abandon any electric or gas facilities. However, a number of applications have been made to the Illinois Commission from time to time for the abandonment of street railway passenger service. The street railway operations were finally totally abandoned in 1935.

7139 Q. Does the Missouri Commission exercise jurisdiction over the depreciation policies of the Missouri companies? A. Yes. As I was describing the valuation case involving the Union Electric Company of Missouri, I mentioned that the Commission in its order prescribed the annual rates of depreciation to be made by the company. They required the company to set aside each year $2,012,000 for depreciation of the electric properties then in existence, plus 3 per cent. on additions after April 30, 1935.

Q. Does the Illinois Commission exercise any jurisdiction over the financial policies of the Illinois companies? A. It

7140 does. They have jurisdiction over dividend payments which might impair capital, and the use of company resources in any business not directly connected with the business of a public utility.

In one case, for instance, the Union Electric Company of Illinois had to get permission from the Illinois Commerce

—3,032—

Commission to advance moneys to its subsidiary, Union Colliery Company.

Q. The Illinois Commission has jurisdiction over depreciation policies of the Illinois companies? A. Yes, it does.

As a matter of fact, however, they haven't issued any orders with respect to depreciation policies of any of the subsidiaries since becoming part of the system.

Q. Does the Illinois Commission exercise jurisdiction over contracts entered into by the companies with affiliated interests? A. Since about 1933, I think, the jurisdiction of the Illinois Commission has been extended to cover such contracts, and embraces almost every type of contract you could think of between affiliated interests.

For example, in November, 1937, in order to maintain 7142
arrangements between several of the companies covering the transfer between one company and another of stock supplies, and surplus materials, Commission approval had to be obtained.

Q. Do the companies submit annual reports to the Commissions? A. In both cases, both Missouri and Illinois; these are detailed, comprehensive reports. They have been filed with the Missouri Commission since 1914. The first report contained 51 schedules, and has been revised from time to time.

In 1936, it comprised 63 schedules. The form that is now 7143
—3,033—
in use, which I believe is quite similar to the Federal Power Commission report—it may be almost identical, with perhaps some additional information required—has about 158 schedules. These schedules call for a company history, information concerning the officers, directors and stockholders, and controlled and controlling companies; and a summary of important changes during the year; balance sheet, income and earned surplus statement, showing the make-up and

detail of transactions during the year, of importance; details on taxes; regulatory commission expenses; officers' salaries, and service and management and engineering contracts; details of plant and depreciation reserve accounts; details on revenues and operating expenses, which covers considerable data on contracts for purchase and sale of energy to other public utilities; and construction overhead; also statistics on generating plant, transmission lines, et cetera, and their operation; and detailed analysis of sales, by rate schedules.

In Illinois the reports are equally comprehensive. The first report prescribed was beginning with the year ended June 30, 1914, and contained 56 schedules. That has grown from time to time, and the present form of report contains about 170 schedules.

The type of information called for by that report is substantially similar to that I have outlined in the case of Missouri.

—3,034—

In Illinois, the companies now make monthly reports, which is largely statistical information, and covers balance sheets and earnings statements, which are broken down by classes of service, and also show details of kilowatt hour sales and output, or the sales by various classes of service.

Q. Do the Missouri and Illinois Commissions have any requirements with regard to maintenance of records in the State? A. Yes, sir. The Missouri Commission requires the companies to maintain an office in the State at which all records and accounts shall be kept, and no records or accounts can be removed except on conditions which the Commission might prescribe.

The same thing is true of Illinois. Of course the general office of the system is in St. Louis, so that all our books and records, all the general books and records, on Missouri properties, are kept there.

The approval of the Illinois Commission was obtained for keeping the books and records of the Illinois companies in St. Louis. It was considered a much more economical thing to have them all in one place, and the Commission approved that.

Q. Do the companies cooperate with the Missouri and Illi- 7148
nois Commissions in the settlement of customers' inquiries? A. Yes, every now and then, instead of a customer coming to us directly with his troubles, he takes them up with the

—3,035—

Commission, and the Commission will write a letter down to us outlining the subject of the customer's letter. It usually sends along a direct copy of the letter. We investigate the matter promptly and make a full explanation to the Commission, and that is usually the end of it.

Q. To what do those letters principally refer? A. Mostly to questions of rural and suburban line extensions. There 7149
are other types of problems which come up from the customers, but the majority of them, I would say, would be on that subject. You see, the utility has to have very definite rules in connection with the sharing of the cost of these line extensions, and many times the customer can't quite understand those rules, so he takes it up with the Commission. The rules are filed with the Commission, and practically have the force of law, so that when we explain to the Commission that we have not deviated from their rules, that usually ends the matter.

Q. Both Commissions have rules prohibiting you from discriminating between customers? A. Yes, one of the principal foundations, I think, of State regulation, is to eliminate unfair discrimination.

Q. So that if a particular customer comes in with a particular request, is it merely a question of whether you would be glad to comply with the request if you were free to do so?

—3,036—

A. No, it certainly is not. There are a number of cases from
7151 time to time where you would like to be able to do something for somebody that comes in, but you just simply can't do it. You have to abide by your filed regulations which have been carefully worked out.

The Examiner: Let us have a short recess.

(Whereupon, a short recess was taken, after which the hearing was resumed.)

—3,037—

By Mr. Browning:

7152 Q. Mr. Woodbridge, are these annual reports to the Missouri and Illinois Commission, which you have described, open to public inspection? A. Yes, they are. The monthly reports filed with Illinois are generally compiled into reports by the Commission embracing more important utilities in the State and those are given circulation.

The annual reports are on file at the Commission's offices, open for public inspection.

Q. Are members of the Missouri Commission's staff frequently engaged in work in the offices or on the property of

7153

your Missouri companies? A. Very frequently. From 1928, with the exception of the year 1937, we have had accountants or engineers from the Missouri Commission in work at the offices or on the properties. That audit of the books of Union Electric Company of Missouri and two of its subsidiaries which we have previously referred to involved four to eight accountants in the offices and extended from September, 1928, to October, 1930.

The appraisal, beginning in July, '31, and extending to July, '36, and the second audit, were made by a force of engineers and accountants which ranged from fourteen to fifty-six individuals.

7154

The amount charged to Union Electric Company by the Commission for the cost of this work, totaled four hundred

—3,038—

sixty-three thousand odd dollars.

In 1938, late in the year, and working right up into April of this year, there were a group of accountants and engineers which ranged from seven to twenty individuals preparing an appraisal of the properties and audit of the books of the St. Louis County Gas Company.

7155

That work has cost the Gas Company some $47,000.00.

Q. Have members of the staff of the Illinois Commission gone to your properties or offices? A. Not to the same extent as in Missouri. From November, 1939, until June of this year, there have been two accountants of the Illinois Commerce Commission making audits of the original cost studies of Mississippi River Power Company and Iowa Union Electric Company.

Charges for that work amounted to about $4,000.00 in the case of Mississippi River Power Company and a little over $1,000.00 in the case of the Iowa Union Company.

Q. Could you give us any figures on the cost to the several companies of the regulation by the Missouri and Illinois Commissions? A. That is pretty difficult to arrive at. We have attempted to make an estimate, but it is really little more than an estimate.

In Missouri the current normal work, we figure, amounts
7157 to somewhere between seventeen and eighteen thousand dol-

lars a year for the Union Electric Company and two small subsidiaries. Most of that, of course, would be Union Electric Company of Missouri.

In the case of Illinois, somewhere between fifty-five hundred and six thousand dollars. The appraisal and audit expenses, of course, amount to much more.

The annual provisions for amortization of appraisal and audit expenses on the Missouri companies, which include the St. Louis County Gas Company, amounts to $106,563.00
7158 a year.

Q. That is your annual amortization of the total cost of the appraisal and audit which was made? A. That is right.

Q. Do you have the figure on what was the total cost of that appraisal and audit? A. Union Electric Company of Missouri—it was $1,121,000 in round figures.

That must have included some previous unamortized expenses in addition to the more recent case.. Cupples Station Company, the total amount was approximately

$6,300.00, a nominal amount on the St. Charles Company and the total on the Gas Company has amounted to a little over $123,700.00.

Mr. Browning: I would like to have marked for identification as Respondents' Exhibit 57, a series of four charts, the first sheet being entitled, "Union Electric Company of Missouri," the second sheet, "Union

Electric Company of Illinois," the third sheet, "Mississippi River Power Company," and the fourth sheet, "Iowa Union Electric Company." 7160

By Mr. Browning:

Q. Were these charts compiled from the books and records of the company under your direction? A. They were.

(The documents referred to were marked for identification as Respondents' Exhibit No. 57.)

Mr. Browning: I offer the charts as Respondents' Exhibit 57. 7161

The Examiner: All right, the charts are received as one exhibit, Respondents' Exhibit 57.

(The documents referred to were received in evidence as Respondents' Exhibit No. 57.)

(Discussion off the record.)

Mr. Browning: I would like to have marked as Respondents' Exhibit 58 for identification, a table of security issues consisting of nine sheets, the first sheet being headed, "Union Electric Company of Missouri."

7162 *John A. Woodbridge—By Respondents—Direct*

(The document referred to was marked for identification as Respondents' Exhibit No. 58.)

By Mr. Browning:

Q. Was this exhibit prepared under your direction from the information taken from the books and records of the company, Mr. Woodbridge? A. Yes.

—3,041—

7163 Mr. Browning: I offer it in evidence as Respondents' Exhibit 58.

Mr. Odell: No objection.

The Examiner: All right, it is so received under that number.

(The document referred to was received in evidence as Respondents' Exhibit No. 58.)

Mr. Browning: I would like to have marked as Respondents' Exhibit 59 for identification a series of four tables, consisting of four sheets. The first sheet, which is entitled "Union Electric Company of Missouri," shows earnings available for common dividends and investment, and investment requirements. The second sheet shows gross income, interest on funded debt and times interest earned.

7164

The third sheet shows property and plant account at the beginning of the year, operating revenues and property and plant per dollar of revenue.

The fourth sheet shows, for Union Electric Company of Missouri and Subsidiaries, shows property and plant account at beginning of year, operating revenues, property and plant per dollar of revenue.

(The document referred to was marked for identification as Respondents' Exhibit No. 59.)

—3,042—

By Mr. Browning:

Q. Was this exhibit prepared under your direction, Mr. Woodbridge, and the material contained therein obtained from the books and records of the several companies? A. Yes.

Mr. Browning: I offer it in evidence as Exhibit 59.

7166

The Examiner: Is the information shown on this exhibit and the previous one correct according to the best of your knowledge and information and belief?

The Witness: They are correctly taken from the books according to the best of my knowledge, information and belief.

The Examiner: All right. These four typewritten tabulations just described are admitted as Respondents' Exhibit No. 59.

(The document referred to was received in evidence as Respondents' Exhibit No. 59.) 7167

By Mr. Browning:

Q. Will you turn to Respondents' Exhibit 57, Mr. Woodbridge? What does the first sheet of this exhibit show? A. This is an historical corporate chart which traces progress from the earliest properties making up a part of the Union Electric Company of Missouri properties, down through to the present company.

You will note that the earliest company, as shown by this chart, was the Guernsey & Scudder Electric Light Company,

7168 which was organized in 1885, doing business in the City of St. Louis, Missouri.

—3,043—

The present company, Union Electric Company of Missouri, was incorporated in November of 1922. We have often referred to this company as Union No. 4 because it was the fourth company in the series which went by the name of Union Electric Company although the others were Union Electric Light & Power Company, and the present company
7169 was formerly named Union Electric Light & Power Company, so we have sometimes referred to it as Union No. 4.

The first Union company which was organized in 1902, was the outgrowth of five companies. On about the fourth column from the left of the chart, including the single Union Electric Company of Missouri as the first column, you will note in the middle of this fourth column, Union Electric Light & Power Company No. 1, organized in 1902, and that was made up of the combination of the five predecessor companies that branch out from that to the right.

The second Union Electric Company resulted from the
7170 taking over of the Missouri-Edison Electric Company, which is a combination of twelve predecessor companies. That will show up in the third column from the left and as a predecessor of the Missouri-Edison Electric Company was this first company I mentioned before, the Guernsey & Scudder Electric Company.

If you look at the chart prior to the organization of Union Electric Company No. 2, there are a great many predecessor companies and also a great many doing business in the City

—3,044—

of St. Louis from time to time.

John A. Woodbridge—By Respondents—Direct 7171

Q. Can you tell us why that situation existed? A. That resulted from the early policy of the City of St. Louis. In 1884, they adopted a franchise ordinance No. 12,723—it is quite a famous ordinance to us out there—which was an open offer to any individual, firm or corporation that wanted to come into an electric business.

If they came in and qualified with the provisions of the ordinance and made an application to install their wires and conduits, then they could get a franchise. They had to accept the terms of the ordinance and post a $20,000.00 bond and 7172
agree to pay the City a proportion of their gross receipts each year. That was two and a half per cent. up to 1890 and 5 per cent. thereafter.

Those 5 per cent. payments that Union Electric Company of Missouri now makes the City of St. Louis, are over $600,000.00 a year at the present time.

The Union Company is a successor to thirteen of the franchises granted under this original ordinance, and the remaining franchises have just gone out of existence.

There were a total of twenty-two individual firms and corporations that qualified under that original ordinance. 7173
The rights under that ordinance are not limited as to duration.

Then there came an intervening period where the policy of the City changed somewhat and they passed an ordinance

which prevented anyone, further, from obtaining a franchise without special approval from the Municipal Assembly, but in 1896 they passed a subsequent ordinance No. 18,680, known as the Keyes Ordinance, which established an under-

7174 *John A. Woodbridge—By Respondents—Direct*

ground district in the downtown section of St. Louis and again made an offer for companies to come in and accept the terms of the ordinance and obtain a franchise.

There were eight electric companies that qualified under this ordinance. Union Electric was the successor of six of these franchises and Cupples Station Light, Heat & Power Company, a subsidiary, held a franchise under this ordinance.

However, the terms of this later ordinance provided that
7175 the rights granted thereunder should expire on April 15, 1940, so that our rights, now, practically stem back to the original ordinance adopted in 1884.

At the present time with the expiration of the Keyes Ordinance franchises in 1940, the Union Electric Company of Missouri is the only company that now holds franchises under the original ordinance.

(Discussion off the record.)

By Mr. Browning:

7176 Q. When did the company extend its operations beyond the City of St. Louis? A. That followed the formation of the third Union Electric Company in January, 1917, and

—3,046—

as shown by the chart, again, the third Union Electric Company is the middle of the second column from the left and that acquired the ten companies in the third column.

Many of those, you will notice, operate in counties outside of the City of St. Louis.

Q. At the time of its formation, in 1922, did the present Union Electric Company of Missouri have any subsidiaries?

A. It had two subsidiaries at that time—the Union Colliery Company, which operated a coal mine at Dowell; the National Subway Company of Missouri, which owned an underground conduit system in downtown St. Louis.

That was acquired in 1926. Union Colliery Company had been incorporated in July of 1917 to develop and operate a coal mine which could be used as a source of supply for the operation of the company's steam power plant and give an assurance that it would at all times have such a source of supply. 7178

In 1927, investment in the Union Colliery Company was transferred to Union Electric Company of Illinois. That company now consumes the major portion of the coal produced at the mine. That transfer was approved by the Securities and Exchange Commission and the Illinois Commerce Commission.

Subsequently, the properties of the National Subway Company were taken over and that company was dissolved in 1927.

Q. Then, if I understand you correctly, Union Electric 7179

Company of Missouri has acquired control of all its present subsidiaries except Union Colliery Company since 1922? A. That is right.

Q. Did it also acquire control of other companies after 1922? A. Yes. In 1923, it acquired control of Cupples Station Light, Heat & Power Company, which I have mentioned several times and the St. Charles Electric Light & Power Company, which does a small business out in St. Charles, Missouri. The same year, the Power Operating Company

7180 *John A. Woodbridge—By Respondents—Direct*

was organized to operate the plants of Union Electric Light & Power Company of Illinois.

Q. I don't think we need to give any more detail on those acquisitions because they are shown on the charts. A. They are shown on one chart or another. They won't all appear on the Union Electric Company of Missouri chart.

Q. Of the thirty-two subsidiaries which either existed in 1922 or were acquired subsequent to that time, how many exist today? A. There are only twelve of those subsidiaries
7181 which exist today and a number of these are in the process of elimination.

Q. We will go into that a little later. A. I might say, in this connection, that the chart shows a total of eighty-two predecessor companies of the system as today constituted. That, however, doesn't really count all the companies

that have one time or another been in the system, because there were a number of transportation companies on the east side, which were in and finally were all eliminated somewhere around 1935. Not all of them; some of them.

7182 Q. Well, now, to recapitulate the present corporate situation, how many companies are there in the Union Electric System? A. The thirteen companies in the Union Electric System, in addition to the St. Louis County Gas Company which we consider in the Union Electric Group, but is a direct subsidiary of the North American Company—of these thirteen companies there are seven electric companies—the Union Electric Company of Missouri, Union Electric Company of Illinois, Iowa Union Electric Company, Mississippi River Power Company, Cupples Station Light, Heat & Power

Company, St. Charles Electric Light & Power Company and Lakeside Light & Power Company.

Of the seven, two companies—St. Charles Company and the Lakeside Company—now have applications before the regulatory authorities for approval of the transfer of their properties to Union Electric Company of Missouri.

The hearings before the Missouri Commission on both of these cases were held just a week ago today and we expect the orders on these cases momentarily and hope the transfers can be made effective as of the end of this month. 7184

On one of those cases there is an application pending before the Securities and Exchange Commission. I believe that all that is necessary in that connection is the receipt of the

—3,049—

Missouri Public Service Commission order.

The other case, the St. Charles case, was so small that it falls within the exemptions prescribed by this Commission's rules. It is also hoped that the properties of Cupples Station Company can be taken over very shortly.

There is a complicated old agreement there which dates back to 1912, between the Cupples Company and Washington University, which expires in February of next year. 7185

A great deal of work is being done on that now to try to work out with the University what will be done when that contract expires and as soon as that situation is solved, the Cupples Station Company will be dissolved.

Accordingly, when that is completed, we will have four electric companies instead of seven, one operating in Missouri, which is the Union Electric Company of Missouri; one in Illinois, Union Electric Company of Illinois, one in

Iowa, Iowa Union Electric Company, which also does a small business in Illinois on the east side of the Keokuk Dam; and Mississippi River Power Company which owns and operates the hydro-electric plant and dam up near Keokuk, Iowa.

That leaves six additional companies now in the Union group.

St. Louis and Belleville Electric Railway Company operates a short electric freight line between Belleville and East St. Louis.

This company carries a large portion of coal that is mined

by Union Colliery Company and supplied to Union Electric Company of Illinois for the operation of its steam power plants.

Union Colliery Company, the company I just mentioned, is the coal company which is owned directly by Union Electric Company of Illinois, the chief user of its coal.

Union Electric Land & Development Company, the principal assets of which consist of the large acreage of land surrounding the Lake of the Ozarks, where the Missouri hydro-electric project is situated. This land is being sold off from time to time as we find customers who like to have property down around this lake, which is largely a resort area.

St. Louis and Alton Railway Company, which I don't consider as an operating company at this time—it owns an electric railway line between East St. Louis and Alton which has been leased since 1930 to the Illinois Terminal Railroad System.

We worked out arrangements for the sale of this railway property to Illinois Terminal Railroad Company and the

transaction was approved some time ago by the Interstate Commerce Commission.

The application on that sale is still pending before the Illinois Commerce Commission. We hope to get the order pretty shortly now and as soon as that transaction is wound up, St. Louis and Alton Company will be dissolved.

Then, there are only two other subsidiaries of the Union Electric Company of Missouri—East St. Louis Railway Company and East St. Louis & Suburban Railway Company.

—3,051— 7190

These two companies are entirely inactive and in process of liquidation. They used to be a part of the transportation system on the east side which was finally abandoned in 1935, but, out of those operations, there resulted a certain amount of ordinary accident and damage litigation and a few of those cases are still pending.

Under the Illinois Law, you can't dissolve a company while it has litigation pending and that is the only thing that holds up dissolution of these two companies.

That completes the present system except for the St. Louis County Gas Company, which does the gas business in 7191 St. Louis County and is a direct subsidiary of North American Company.

Q. You have used the term "east side" several times. Will you state for the record what you mean by that? A. There is a territory on the east side of the Mississippi River in Illinois which is so much a part of the metropolitan area of St. Louis—it comprises the City of East St. Louis, and a number of surrounding villages and we very frequently just refer to it as the "east side," the City of St. Louis being the west side.

7192 *John A. Woodbridge—By Respondents—Direct*

Q. Has the Union Electric Company of Missouri or any of its three predecessors known as Union Electric Light & Power Company ever defaulted in the payment of any interest on principal on any indebtedness? A. Never.

3,052

Q. What is the dividend record of those companies? A. No dividends were paid prior to 1907. Up to that time, a surplus of practically over a million dollars had been accumulated and since that time dividends have been paid
7193 each year on the common stock and on preferred stock since its issuance.

Q. So that there has never been a default on the preferred stock dividend? A. Not of the Union Electric Company of Missouri.

Q. Can you give us some figures to indicate the growth of the Union Electric System? A. Well, the first Union Electric Company, the number one company, started off with a capitalization of around $6,700,000.00 of stock, and somewhat over a million and a half of bonds.

The present company has $65,500,000.00 of stock and
7194 $95,000,000.00 of bonds and notes.

The operating revenues for the year 1904 amounted to somewhat over $1,500,000.00 and the property and plant account at the beginning of the year was somewhat over $13,500,000.00. At the end of 1939, the operating revenues of the company, I believe, amounted to over $26,600,000.00. It shows an increase, I believe, of something well over 1,700 per cent., and the property and plant account—I believe this is on a consolidated basis—amounted to over $233,000,000.00

—3,053—

at the beginning of the year 1939.

(Discussion off the record.)

By Mr. Browning:

Q. Will you give us the present capital structure of the Union Electric Company of Missouri? A. On a corporate basis, it has $80,000,000.00 of bonds which amount to 45.1 per cent. of the total; $15,000,000.00 of 3 per cent. five-year notes, amounting to 8.5 per cent. of the total; $13,000,000.00 of preferred stock, 7.3 per cent. of the total; advances on open account from subsidiaries, roughly, $6,800,000.00, amounting 7196
to 3.8 per cent. of the total; common stock of $52,500,000.00, 29.6 per cent.: and surplus as of July 31, 1940, of roughly $10,200,000.00, amounting to 5.7 per cent., making a total of $177,500,000.00 in round figures.

The common stock equity exceeds 35 per cent., and since 1905, at which time the equity was the same, it has been approximately that figure right straight along.

It is interesting to note in this connection that since the organization of the present company in 1922, all of the common stock except 550,760 shares, which was issued in exchange for the common stock of the predecessor company, 7197
had been paid in cash by the parent company.

Q. By— A. (Interposing) North American Company. The bonds, after taking into account that 22,000,000 of

those bonds are really secured by 22,000,000 pledged bonds of Union Electric of Illinois, the bonds of Union Electric Company of Missouri are equal to about 45.7 per cent. of the property account.

Do you want that on a consolidated basis as well?

7198 *John A. Woodbridge—By Respondents—Direct*

Q. Yes. This is a consolidated basis for Union Electric Company of Missouri and its subsidiaries? A. And its subsidiaries. It does not include the St. Louis County Gas Company.

The $80,000,000.00 of bonds on a consolidated basis amounted to 39.1 per cent. of the total; $15,000,000.00 of notes to 7.3 per cent.; funded debt of subsidiaries, totaling $19,270,500.00, to 9.4 per cent.; preferred stock of the Union Electric Company of Missouri of $13,600,000.00 amounts to
7199 6.4 per cent. of the total; preferred stock of subsidiaries, $8,234,475.00, 4 per cent.; $52,500,000.00 of common stock amounts to 25.7 per cent.; the consolidated surplus, $16,386,000.00, 8 per cent.; and minority interest in capital and surplus of subsidiaries, $61,768.00, amounting to one-tenth of one per cent., making a total of $204,453,000.00.

The funded debt is equivalent to 48.1 per cent. of the consolidated property, and the equity of the North American Company in the assets of the system is 33.7 per cent. which is just slightly less than the North American Company's equity in the Union Electric Company of Missouri, itself.

7200 —3,055—

(Discussion off the record.)

By Mr. Browning:

Q. I believe you testified that all securities issued by Union Electric Company of Missouri since April 15, 1943, have been approved by the Missouri Public Service Commission. A. Yes. That means, of course, that all of the securities of the company that are now outstanding have had the approval of that commission.

Q. Have there been any write-ups in the property accounts of the company since the organization of the first Union Electric Company in 1902? A. I am not sure of 1902. There have been none since 1903, the date of the organization of the second Union Electric Company. At that time, there was a reduction in capitalization which more than offset an increase which was made in 1902 on the organization of the first Union Electric Company. Since that time, there have been no write-ups in the property account of the company or its investments against which any securities were issued nor 7202 in the property accounts of any subsidiaries since becoming part of the North American System.

Q. Turning to Union Electric Company of Illinois, the second sheet of the Respondents' Exhibit 57, shows the predecessors of that company? A. Yes. That shows sixteen predecessor companies. The present Union Electric Company of Illinois is the continuation of the East St. Louis Light &

Power Company which was incorporated in 1908 under the name of Consumers Light, Heat & Power Company.

This company was doing an electric utility business in 7203 East St. Louis, Illinois, and surrounding territory. In 1910 there was a merger of two other companies with East St. Louis Light & Power Company surviving, and in 1937, in connection with the large Union Electric financing of that year, four other companies were merged into East St. Louis Light & Power Company to form what is now known as Union Electric Company of Illinois.

I think that is pretty clearly shown on the chart.

The present capitalization of the Union Electric Company of Illinois consists of $22,000,000.00 of bonds, amounting to

7204 *John A. Woodbridge—By Respondents—Direct*

51.2 per cent. of the total; $18,000,000.00 of common stock, amounting to 41.9 per cent. of the total; capital surplus of $1,577,985.00, amounting to 3.7 per cent., and earned surplus as of July 31, 1940, of $1,378,970.00, amounting to 3.2 per cent., or a total of over $42,900,000.00.

This company has no securities outstanding with the public, and all of its bonds and stock are owned by the Union Electric Company of Missouri and are pledged under the Union Electric Company of Missouri mortgage.

7205 Q. The third sheet in Respondents' Exhibit 57 deals with Mississippi River Power Company; does it not? A. Yes, sir.

—3,057—

Q. It shows the predecessors of that company? A. Yes. I wish I were more thoroughly familiar with the initial history of this company because it is one of the most exciting stories in the utility business. The Keokuk Dam, I believe, was the first hydroelectric project in the country and it was quite a job to harness the waters of the Mississippi River there at that early date.

The company was organized in 1910 and acquired the pre-
7206 liminary development work and construction work of its four predecessors that had started the construction of the project, which was under an Act of Congress.

The North American Company acquired control of Mississippi River Power Company in October of 1925, and in the next year, the investment was transferred to Union Electric Company of Missouri.

I have previously mentioned the subsidiary of Mississippi River Power Company and Missouri Transmission Company, which was dissolved and the assets taken over in the last few years.

Q. What is the present capitalization of Mississippi River Power Company? A. This company has $15,753,500.00 of bonds, amounting to 32.4 per cent. of the total; $2,817,000.00 of debentures, amounting to 5.8 per cent.; $8,234,475.00 of preferred stock, 17 per cent.; common stock, $16,000,000.00, 32.9 per cent.; surplus, $5,768,584.00, 11.9 per cent., making a total of over $48,500,000..

—3,058—

The bonds and debentures have been reduced from their original amounts of $20,648,300.00 in the case of the bonds, 7208
and $3,000,000.00 in the case of the debentures, to the figures I have mentioned there, by operation of the sinking fund.

The Union Electric Company of Missouri, owns 99.7 per cent. of the common stock of the Mississippi River Power Company, which makes its equity 44.7 per cent. of the total capitalization.

Q. The bonds, debentures and preferred stock are held by the public? A. Yes.

Q. The fourth sheet of Respondents' Exhibit 57 shows the corporate predecessors of Iowa Union Electric Company? A. It does. 7209

That shows twelve predecessors. The Iowa Union Electric Company was originally Keokuk Electric Company organized in December, 1911.

Shortly after its incorporation, it acquired the properties shown in the last column of the chart. This company did not come into the North American System until 1925, in October, and was originally acquired by North American Company and transferred to Union Electric Company in 1926, through the transfer of the stock ownership of Central Mississippi Valley Electric properties.

7210 *John A. Woodbridge—By Respondents—Direct*

That was an intermediate holding company and was dissolved in December, 1937, so that Iowa Union is now a direct

—3,059—

subsidiary of Union Electric Company of Missouri.

Also, at that time, it acquired the properties of two other subsidiaries—Fort Madison Electric Company and Dallas City Light Company, which were dissolved.

Q. Have you the total number of predecessor companies which were combined to form the system as today consti-
7211 tuted? A. I think I have already mentioned that. About eighty-two companies, exclusive of certain transportation companies that have been in the system and have been out of the system and are not really predecessors of existing companies in the system.

The Iowa Union Electric Company is the only other subsidiary of Union Electric Company of Missouri that has any securities outstanding with the public.

Its capitalization consists of common stock, $999,315, amounting to 52.2 per cent. of the total; $700,000.00 of bonds, 36.5 per cent., and surplus as of July 31, 1940, of
7212 $215,600.00, amounting to 11.3 per cent.

All of the common stock is owned by Union Electric Company of Missouri and the bonds are held by the public.

The property account of this company, on July 31, was $2,254,000.00 and funded debt amounted to approximately 31.1 per cent. of that amount.

I think it might be wise at this time to recapitulate on

—3,060—

the securities outstanding with the public.

All the bonds, notes and preferred stock of Union Electric Company of Missouri are held by the public. The

$700,000 of bonds of Iowa Union, which I have just mentioned, are outstanding with the public, and the bonds, debentures, preferred stock and a very small minority of the common stock of Mississippi River Power Company are held by the public.

Then, St. Louis County Gas Company, the direct subsidiary of North American, has bonds outstanding with the public, but all of its common stock is owned directly by the North American Company.

Q. So that those four companies, Union Electric Company of Missouri, Iowa Union Electric Company, Mississippi River Power Company, and St. Louis County Gas Company, are the only companies which have any securities outstanding in the hands of the public? A. That is correct. 7214

Q. What is the interest and dividend record of Union Electric Company of Missouri and its subsidiaries since it acquired control of such subsidiaries? A. Since that time there has never been any default in the payment of interest or principal on any funded debt in the hands of the public and dividends on preferred stocks held by the public since that time have been regularly paid. 7215

Q. When due? A. When due.

—3,061—

Q. What financing staff do you maintain in the Union group? A. We have no financing staff out there. Of course, I have some familiarity with the mechanics of working up security issues from my previous experience, but we have no financing staff really at all.

Q. And you are engaged in handling other matters besides those dealing with finances? A. A very large part of time, practically all my time, yes.

7216 *John A. Woodbridge—By Respondents—Direct*

Q. How does the Union group handle its financing problems? A. Well, ever since I have had anything to do with any of these financings and, I am sure, long before that, they have always relied on the staff of the North American Company which takes the place of any attempt on the part of the Union group to maintain its own staff and that is done without charge to the Union group.

Q. Would it involve expense if the Union group installed a financing staff at St. Louis? A. I believe it would amount
7217 to quite a considerable expense. The Union properties comprise a very large group and its financing problems, when we have them, run to considerable magnitude.

—3,062—

You would have to go out and retain real experts in the field, if they were available, and, therefore, the ability to rely on North American staff really represents a substantial economy.

Q. Would it be preferable for you to maintain a financing staff in the Union group comparable to that of the North American Company? A. I don't believe that it would. As
7218 you will notice from our attempts to get the Union group down into the smallest number of companies possible, our financing problems would not be a day-to-day matter. We would have one large question of financing at one time and another at another time.

If we had to maintain a financial staff out there, there would be long stretches where there would be nothing for them to do.

Q. Can you give us a typical example of the help which North American renders in financing matters to the Union

group? A. The 1937 issue is a very good example of that. That was a financing of some magnitude. The problems to be met at that time were the refunding of the outstanding funded debt which carried interest rates of 5 per cent. for most of it, and the acquisition of additional capital for expansion.

These problems were given considerable attention by the North American staff and a number of different plans were considered.

—3,063— 7220

At first, the pressing need at that time was an additional generating capacity at the Cahokia Plant and so attention was given to financing Union Electric Company of Illinois. However, the Missouri Company also needed additional funds and there was an opportunity to refund all the funded debt at a reduced interest rate.

A plan was finally arrived at which was developed very largely by the North American staff, was an issue of eighty million of bonds, fifteen million of notes, by the Union Electric Company of Missouri.

Incident to that was the merger of these four companies 7221
on the east side into East St. Louis Light & Powe. Company, which made an aggregation of properties sufficient to support the twenty-two million of bonds issued by the—sold by it to Union Electric Company of Missouri.

The bonds sold carried a 3¾ per cent. interest rate, refunding some $63,750,000.00 of the general mortgage bonds of the Missouri Company, all of which carried a 5 per cent. interest rate, except $11,250,000.00 which had a 4½ per cent. coupon.

The pledge of the Illinois bonds made the security attractive from the point of view of additional collateral and afforded an indirect lien on the assets of the Illinois Company.

The common stock was pledged under the Missouri mortgage as well as the bonds. In addition to the Missouri securities that were refunded at that time, were eight million of preferred stock of Union Electric Light & Power Company

—3,064—

of Illinois, which was one of the constituents of the 1937
7223 merger; $6,750,000 of bonds of that company and $2,400,000.00 of bonds of East St. Louis Light & Power Company.

If I recall correctly, I think that six million seven of preferred stock was a 6 per cent. stock. The issue produced at least $7,000,000.00 of additional cash for construction purposes; $4,000,000.00 of that was deposited under the Illinois mortgage and $3,000,000.00 under the Missouri mortgage.

Those deposits were subsequently drawn down when the
7224 expenditures were made and certified to the trustees.

To give you an idea of the magnitude of this operation, it required several months of the most intensive work to devise a plan to carry it through. It required the preparation of many papers and documents which included over thirty different applications to four different regulatory commissions—Missouri Public Service Commission, Illinois Commerce Commission, Federal Power Commission and the Securities and Exchange Commission.

All of these documents were quite elaborate in their detail. North American staff was engaged on this in the

beginning, working out the plan and the character of the securities. I, myself, having had quite a bit of experience from the legal end on North American financings, went out to St. Louis as counsel. I was out there for six weeks on the ground, working out the details and these various appli-

—3,065—

cations that had to be made to these various commissions and also the question of registration under the Securities Act.

A great many problems arose in connection with the job; 7226
one that I distinctly remember was the question of financial relationship between the parent company which was issuing the bonds and the subsidiary company which sold its bonds to the parent and which pledged them under its mortgage.

The bankers wanted to make the lien in the Missouri mortgage as close a lien as possible on the business and properties of the subsidiary company, wanted to be sure that the subsidiary couldn't create any type of a security which could come ahead of the pledged bonds, but every now and then, and sometimes fairly frequently, there has to be an interchange, and moneys advanced by the parent company 7227
to the subsidiary. It was finally worked out by the assistance of the people at North American Company that there should be a leeway there and that the subsidiary should be permitted to have outstanding at any one time up to a million dollars which could just be an open account and not represented by pledged securities.

The staff of North American Company were, as I have outlined, extremely helpful in all these questions and they brought their long experience to bear, which they had gained

7228 *John A. Woodbridge—By Respondents—Direct*

over many years in working on securities, both of the Union Electric group and of other companies of the North American system.

—3,066—

I don't mean to imply that a lot of work wasn't done by the St. Louis people. They had an enormous amount of work to do in compiling statistical information and working up the financial statements and working on the registration statement, but I don't believe they had anyone there that
7229 was really qualified to pass on the type of securities to be issued to the public.

Several members of the North American staff were working night and day throughout this whole period.

At the time that I wasn't in St. Louis, I was working on the job back here, very closely with Mr. Piske, the vice president of the North American Company, who stayed right with the job until we broke up each morning, which was around two, three or four o'clock.

Mr. Piske has a very extraordinary knack of being able to push these things through and keep them moving.

7230 Another member of the North American staff, Mr. Allen Van Wyck, was of tremendous value in connection with the mortgage. Mr. Van Wyck was a student of public utility mortgages for many years, having gained a lot of experience from the legal end while he was associated with Sullivan & Cromwell, and since 1933, he had been with the North American System and acquired a great deal of operating knowledge as well.

The representatives of the bankers and their counsel are very good on devising all kinds of restrictive covenants and

restrictive provisions on stock issues which, on paper, sound

—3,067—

very good, and offhand, may seem to be in the interest of investors, particularly when you consider the substance of them, but when you consider the detail of the way they might operate, you can arrive at the same result from the point of view of soundness of the investment, without putting in provisions which may, at times, just hamstring the operation of the company.

So, when you get a man like Mr. Van Wyck, who has had 7232
both the legal and the operating experience, he was of tremendous assistance to me as counsel in just pointing out and explaining to the bankers' representatives and their counsel, how a particular provision would not work satisfactorily with regard to the operation of the company.

Usually, the result would be that a provision would be worked out that was equally satisfactory from the investment point of view, but was much more workable from the company's point of view.

I mentioned my six weeks in St. Louis. Actually, there 7233
was over two and a half months spent on that job, since I started in on it. I was doing the legal work as distinct from the financial.

I wasn't qualified, myself, to make decisions with regard to the character of the securities. That requires real experience in issue after issue, that the North American people, particularly the president of the company Mr. Fogarty had. He has worked with the heads of the investment houses year after year on security issues of the various subsidiaries and

—3,068—

he follows the types of securities that can be issued and sold under particular circumstances and has always kept very familiar with that situation.

If Union Company had had to rely on its own resources at that time, I think that they would really have had to go out and get some expert people who might have taken the place of the North American staff. I don't mean by that to say that Union Company couldn't have sold its securities, but they had no one and I don't consider that even now we
7235 would be qualified to go out and get the best price obtainable for the type of securities that would serve the company and in the best possible way.

Furthermore, I don't, myself, know of any independent financial experts that would have been available or are available now who would approach the quality of the assistance that the North American Company gives us in such matters and, if they were, they wouldn't bring the same type of approach to these problems that the North American Company people do.

North American has the entire equity in the Union Elec-
7236 tric Company of Missouri and they are a distinctly interested party whenever we have any financing problem, so that they come in, not only with their long experience, but with their financial stake, and I don't believe that there is any expert, any independent expert, or any banking house, however hard it tried to look at these problems from the company point of

—3,069—

view, that could take the place of the North American people.

Their point of view is completely different. The bankers certainly perform a function. Usually, whether they act as agent for the company in the sale of securities or as direct

underwriters for the purchasing of securities from the company and reselling them to the public, their primary interest is to get a security that they can sell as promptly as possible and eliminate the risk that they take, particularly in the case of an underwriter.

They also perform a function of looking out for the interests of the investors, because, in order to protect their own reputation, they want to sell a good security.

But, I have worked on so many of these things with bankers' representatives and bankers' counsel, that I am just 7238
positive that they can not bring to bear the company's point of view, and it is that very important thing which the North American Company brings to our aid in connection with the financial problems.

There is another thing along those same lines. The North American system has quite a number of securities to sell from time to time, much more than any particular component of the group.

That, I believe, gives the system, as a whole, a greater bargaining power than the individual company, itself, might

—3,070— 7239

have.

The bankers in their zeal to sell a sound security at a price that will move it right out quickly, they might well be able to—I won't say exactly put it over on the company, but not get as good a price for the company as could be obtained where you have a lot of securities to sell from time to time. If a particular banker is coming up on one issue, they know that they have got to put in their oar on following issues thereafter and that, I think, creates a greater bargaining power on the part of the combined companies.

7240 *John A. Woodbridge—By Respondents—Direct*

I think that puts the bankers more on their toes than if they were dealing with the company's isolated transactions.

Mr. Browning: That is all.

Mr. Odell: Does that complete your direct examination?

The Examiner: Off the record.

(Discussion off the record.)

The Examiner: We will recess at this point until

7241 2:30.

(Whereupon, at 12:55 o'clock p. m., the hearing recessed until 2:30 o'clock p. m. the same day.)

7242

Colloquy 7243

AFTERNOON SESSION.

(The hearing was resumed at 2:30 o'clock p. m.)

The Examiner: The hearing will be in order.

Mr. Odell: Mr. Examiner, I am not in a position to cross examine Mr. Woodbridge at this time.

We would like to reserve our right to cross examine Mr. Woodbridge, and will request counsel to recall or make Mr. Woodbridge available for cross examination any time before the evidence with respect to the Union Electric Company and subsidiaries is completed. 7244

Mr. Browning: That is satisfactory.

The Examiner: Very well, that agreement will be followed.

(Discussion off the record.)

The Examiner: In view of the situation, I take it that you gentlemen would prefer to have Mr. Stokes resume the stand tomorrow morning, would you not?

Mr. Browning: That is correct.

Mr. Odell: That is agreeable to me. 7245

The Examiner: Very well, we will recess until tomorrow morning at 10 o'clock.

(Whereupon, at 2:35 o'clock p. m., a recess was taken until 10 o'clock a. m., Wednesday, October 30, 1940.)

—3,072—

7246

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

7247 THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1101,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Wednesday, October 30, 1940.

7248 Met, pursuant to adjournment, at 10 o'clock a.m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for Respondents.

RALPH C. BINFORD and HERMAN ODELL, Attorneys for the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will be resumed.

Mr. Hamilton: Will you resume the stand, Mr. Stokes?

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued): 7250

Q. Mr. Stokes, you have previously described to some extent the various divisions and departments in the Union Electric Group, and have referred to the individuals charged with their operation. Can you illustrate the organization of the outlying plants division of the Union Electric Group by reference to a specific community in that division? A. The outlying plants divisions have been previously mentioned, and I shall illustrate the answer to your question by using the Jefferson County division as an example.

That division lies south of St. Louis County and the City of St. Louis, and contains a number of fairly sizeable towns, among which are Festus and De Soto. 7251

The organization of that division is under a general superintendent of all divisions, who is Mr. H. M. Patton. He was mentioned previously. Under him comes the division manager. In this case he is located at Festus in Jefferson County, Missouri.

—3,074—

The division manager is Mr. D. Orville Collins. Mr. Collins is 37 years old, has been with the company for 14

years. He was appointed to his present position in 1939 as the result of the death of the previous division manager, Mr. E. T. Manley, who had been in charge of that division for many years.

Mr. Collins has had various positions with the company, starting in as student engineer, until he is now manager of this division.

Under him is the local representative in each of the larger towns. In De Soto, for example, the local representative is
7253 Mr. Henry Spencer Ditch. He is a man 50 years old, who has been with the company since 1922, and had been primarily engaged in line work. He was a Class A lineman before being made local representative.

The organization at De Soto consists of this local representative and two other men, as well as the young lady who handles the office. These three men have to take care of, or do take care of all of the work that arises in the ordinary routine.

If major construction work or serious cases of trouble were to develop, which would be too great for them to handle, they would call on the division manager at Festus, which is
7254 only about 20 miles away, and he would send over the division crews and equipment.

—3,075—

The outlying division functions somewhat independently from the city, in certain respects; that is to say, all operations which will give the customer better service by reason of being handled locally in the division, are carried out that way.

For example, the collections, credits, billing, and all bookkeeping records and operations which require contact with

the customer, and where he would be delayed if those were carried on in the city, such operations are carried on locally, partly at the local office, such as De Soto, and the rest of it at Festus.

I might illustrate. The metering, of course, has to be done locally, the meter slips and the meter-reading routes followed up in the regular book. That is then transferred to Festus, where the rest of the bookkeeping is done, and the summaries are transferred to St. Louis.

The addressograph work for sending out the bills is done 7256
in St. Louis, but as a usual thing, although not always standardized, the bills are delivered from the division office.

Property records and such matters, which do not concern the customer, are handled in the St. Louis accounting division.

De Soto may be used as an example of the effect on the service and rates and the general effect on electric service in the district, as the result of the Union Electric Group ac-

quiring the properties.

The situation at De Soto is in no way particularly differ- 7257
ent from any of the other typical towns in the outlying divisions, and in the interest of brevity I shall use it as an example.

The property at De Soto, prior to April 1, 1917, was served by the Consumers Electric Light & Power Company. I had some participation in the acquisition of this property, and following the acquisition had complete charge of that division for a number of years, including all operations, such as construction, as well as the ordinary operating functions.

7258 *Stanley Stokes—By Respondents—Direct*

This Consumers Electric Light & Power Company was a small, local power company, belonging to a man named Munroe, and his family, who were residents of De Soto.

The family all seemed to be interested in the business, the father acting in the capacity of president and general manager. There were four individuals engaged in the operation, one of whom was Mr. Munroe's son, and who acted as vice president, and in the office force there was another son of Mr. Munroe who was secretary and acted as a clerk.

7259 The owner himself was active in the operation of the business, and he made agreements for service with the various customers, and handled practically the greater part of the business matters.

—3,077—

The office force was located at a bank which was owned and operated by Mr. Munroe as his principal business, and the company's records were kept more or less in conjunction with those of the bank.

At the date of acquisition by the Union Electric Group,
7260 the property in use, serving the city, was carried at about $55,000 on the books of the Consumers Electric Light & Power Company. This was about what an appraisal later showed. The property itself, briefly stated, consisted of a generating plant containing two 90-kilowatt, 60-cycle generators, only one of which could be operated at a time.

They were driven by a 150 horse-power Corliss engine, the distribution system being about typical for the usual small town at that time, and supplied service to the customers, which numbered 327 as of that date.

During the year 1916, approximately 121,000 k. w. h. were sold by the Consumers Electric Light & Power Company. By April, 1917, the end of the first month's operation by Union Electric, there were 362 customers served.

At the time the property was taken over by the Union Electric, only night service was furnished, except for one day a week when service was furnished for several hours to permit the housewives to do their ironing.

Repeated efforts had been made by the citizens of De Soto to obtain continued service, but had met with no success. 7262

—3,078—

The first month's operation at that town was somewhat hectic. The property was in very bad shape, the plant particularly, and we were repairing it, trying to get it up in shape, particularly the engine. It hadn't been overhauled for so long that when we took the piston out, one of the piston rings had been completely eroded by the water in the steam, and had disappeared, one of the sections of the Corliss rings was totally missing, had gone out through the exhaust.

Within a very short time after we took the plant over, 7263 and were trying to operate it, pending better facilities, the generator burned out a coil. I received a call from the local engineer, so-called. I was in Festus at the time, and I grabbed a car and hurried over there, and on the way over I met young Munroe, who was at that time still acting as local manager for us. He was driving out into the country on some kind of a party, and he hadn't been of much help anyway, so I didn't bother him.

I went on in and found out that the generator was in bad order, called for help and supplies from St. Louis, and in the

7264

meantime we took off our coats and went to work. It was about a 24 hours' steady job there trying to get that thing back into service. We had to go to the drygoods store and get some bias tape, such as women use on their dresses, and some shellac, and rewound the coils for temporary service. That machine didn't last but a few hours. We found it was so old that the insulation was so cracked that you could

—3,079—

hardly remove one coil without damaging the next.

7265 There were two other small generators there that hadn't been used for some time, and we rigged those up during the day and night, and belted them up to the engine temporarily, and were able to continue service.

We then went right ahead with plans for the construction of a transmission line from St. Louis County to Jefferson County, a distance of about 36 miles to Festus, and another 15 miles by the route of the line, over to De Soto.

This line was put in service as quickly as possible, and a sub-station built at De Soto, and from there on we had no further difficulties of any consequence.

7266 The rates in effect at De Soto immediately prior to the acquisition of the property were:

First 20 kilowatt hours per month—15 cents per kilowatt hour.

Next 20 kilowatt hours per month—12 cents.

Over 40 kilowatt hours per month—8 cents per kilowatt hour.

Prompt payment discount for payment within ten days—10 per cent.

Minimum monthly bill: residence service—75 cents; all other service—$1.

The only source of supply which the Consumers Company
—3,080—
had was its little plant which has been described, and the distribution system was all overhead construction of rather early vintage and in no way complied with the usual power company standards, nor was it in accordance with safety code requirements.

In the process later of making an inventory of the property there, I found that the heavy wire was not unusually located at the end of the circuit, with light wire up toward 7268
the plant. In other words, they used whatever they had at the time, and added on.

Subsequent to the acquisition of the property of this Consumers Electric Light & Power Company, many changes were made, two of which were probably the most important.

First, by early 1918, 24-hour service was being rendered as a result of the completion of the transmission line. I am a little ahead of myself there. We began to render 24-hour service before we actually completed the transmission line. The line followed shortly afterward. At the present time the sub-station at De Soto, with a firm capacity of 1,000 k. v. a., 7269
is supplied with the energy required over a 33,000-volt line connected through transformers to our 132,000-volt, double-circuit transmission line. The sub-station at which this voltage is stepped down is located at Festus in Jefferson County, Missouri. This 33,000-volt line also has emergency supply over a double-circuit, similar line, from Rivermines plant,
—3,081—
which has been previously described. Thus De Soto has available adequate facilities for high quality, continuous service.

7270 *Stanley Stokes—By Respondents—Direct*

The second major change which took place after the Union Electric Group acquired the property was a change in the rates. Effective June 1, 1918, a new schedule of rates was installed, under which charges for residential service to customers using from 20 to 50 kilowatt hours per month were reduced from 20 to 45 per cent.; and charges for commercial service of 20 to 50 kilowatt hours per month were reduced in a varying amount, from 23 to 36 per cent.

7271 The customers in De Soto have since benefited from Union Electric Group policy of making voluntary rate reductions.

The present residence rate schedule in effect is:

First 32 kilowatt hours per month—6 cents.

Next 168 kilowatt hours per month—3 cents.

Over 200 kilowatt hours per month—2 cents.

For prompt payment—discount of 5 per cent. on the first $25 of monthly bill, and 1 per cent. on the excess above $25, the discount date being 10 days from the date of the bill.

Minimum monthly bill—75 cents.

7272 Under these rates, charges for energy have been reduced as indicated in a little group of comparisons which I propose to give you, and the reduction refers to the rate in effect at the time we took over the property, or just prior to that.

For a customer using residential service and taking 20 kilowatt hours per month, the per cent. reduction has amounted to 57.8. For various uses per month, in a similar manner, the per cent. reduction varies from a minimum of 44.4 up to as high as 62.2 per cent.

On the commercial rates, a customer using 20 kilowatt hours per month has obtained a reduction of 47.4 per cent.; and one using 250 kilowatt hours per month, a reduction of 58.4 per cent., with the reduction varying in between those values for intermediate use.

Substantial improvements in the service rendered at De Soto have been important factors in the increase in the electric business in that town, the number of customers having increased from the 362 at April 30, 1917, to 1,413 at September 30, 1940, notwithstanding the fact that the population of De Soto has increased only from 4,721 in 1910 to 5,117 in 1940. This little town is not growing rapidly at all, but the ratio of the increase in electric service to that of the population is striking. 7274

Total kilowatt hour sales for the 12 months ended September 30, 1940, were 1,776,546. This is an increase of 14.7 times the comparable total for the year 1916.

Also during the period, the distribution system has been modernized, and the property in De Soto is in excellent operating condition. —3,083— 7275

That type of improvement in the service rendered to the customer is fairly typical of the various outlying plant properties with which I had connection.

Q. Very briefly, Mr. Stokes, can you characterize the labor relations existing in the Union Electric Group? A. The relations between the companies and their some 4,900 employees, have long been harmonious. By "companies" I mean the Union Electric Group and the associated companies which have been previously mentioned to some extent, such as the Union Colliery Company and the St. Louis County Gas Company, and so on.

7276 *Stanley Stokes—By Respondents—Direct*

The 3,800 employees in the Union Electric Group proper are represented by an association known as the Employees Mutual Benefit Association. Since 1918, there have been contracts with the association and its membership, which now includes practically all of the employees of Union Electric Company of Missouri, the employees of the Cahokia and Venice plants of Union Electric Company of Illinois, the Cupples Station Light, Heat and Power Company, the Lakeside Light and Power Company, the Union Electric
7277 Land and Development Company, the Iowa Union Electric Company, the Mississippi River Power Company, and the St. Louis County Gas Company.

These contracts between the management and the association contain agreements with respect to wages, hours of labor, general working conditions, and pensions.

—3,084—

A general labor committee represents the association's members in all labor matters. Most of the questions brought up through this committee that cannot be settled readily are referred for decision to a board of adjustment, about
7278 which I have previously briefly made some remarks.

Major problems are brought to the attention of the management by the association's board of directors, and solutions are worked out through the medium of special committees appointed by these directors to negotiate with the management.

This Employes' Mutual Benefit Association is now, under the present labor laws, the agency for the employees with which to deal with the management.

But the interesting point about this is that this association carried on very similar work and relations for many years previously.

The complete revision of wage rates and job classifications, which was agreed upon in 1937, is a notable example of the satisfactory solution of a major labor problem. No strike of any kind has even been called by the Employes' Mutual Benefit Association.

In the East St. Louis and Alton divisions of the Union Electric Company of Illinois, there are about 350 employees. Those working in offices and on the inside, as distingushed from outside workers on lines, sub-stations, and so on, have

—3,085— 7280

never professed any union affiliation. However, Union Electric Company of Illinois and its predecessors have had contracts since 1899 with the International Brotherhood of Electrical Workers, a branch of the American Federation of Labor, which contracts covered the wages, hours of labor, and general working conditions of the outside employees belonging to that group.

Labor relations have been most satisfactory as indicated by the fact that in 40 years there have been only 7 days of suspended operation caused by labor differences.

Q. Now this is the East St. Louis and Alton divisions? 7281
A. That is right.

St. Louis & Belleville Electric Railway Company has contracts with affiliates of the American Federation of Labor covering wages, hours, and working conditions of trainmen, car repairmen, and electricians, who comprise more than half of the 65 employees of the company. No time has been lost in more than 10 years due to labor differences.

The Union Colliery Company has a labor contract with the United Mine Workers of America, an affiliate of the

C. I. O., covering all but about 50 of the 650 employees of the company.

At various times, idle periods have been experienced, in common with other coal producers, due to failure to agree

—3,086—

with the union on general conditions, but in more than 10 years the property has been idle only one day due to local differences.

7283 Wages paid by the Union Electric Company of Missouri, and subsidiaries, and the St. Louis County Gas Company, compare favorably with those prevailing elsewhere in the locality for similar kinds of work.

Vacations with pay are granted to all regular employees except those on the hourly payrolls of St. Louis & Belleville Electric Railway Company, and Union Colliery Company.

For employees paid monthly, the vacation period is one week after 7 months of service, increasing proportionately for longer periods of service, up to one year, at which time the period becomes two weeks, that is, the vacation period.

7284 For employees paid hourly, the period of vacation is one week for those with more than one year of service, and two weeks after 5 years of service.

The standard work week for non-supervisory employees is 40 hours throughout the property, with a few exceptions, the major one being in the case of the miners of the Union Colliery Company, whose work week is 35 hours. The usual overtime rate is time and a half. That statement has to do with the regular operating employees; that is, where the construction work of a major character is under way, in which

—3,087—

the building trades are involved, most all of their rules now require double time for overtime.

The safety organization in the Union Electric Group is complete, and functions with success. The value of all modern safety devices is recognized, and many are in daily use. Small group safety committees, with representatives from each group, comprising a central safety committee, bring to light hazards requiring correction, and offer suggestions which, in their opinion, will promote safety.

A safety coordinating committee functions to standardize 7286
safety practices throughout the properties, and to see that action is taken to correct hazards that have been observed.

Safety work is encouraged in many ways, such as granting of plaques, cups and other trophies to groups having the best safety records. Any employees in the St. Louis district who would benefit by such instruction, are recommended to attend the foremen's safety training course conducted annually by the St. Louis Safety Council.

In 1939,—113 employees received certificates for taking this course.

A safety bonus plan is fostered by Union Colliery Com- 7287
pany whereby cash premiums are paid for safe operation. Since the beginning of this bonus plan, about $45,000 has been disbursed to employees.

Q. Are recreational activities sponsored by the Group

for the benefit of the employees? A. Recreational and social activities are promoted at the present time under the direction of the industrial relations department, through various employees' committees.

7288 *Stanley Stokes—By Respondents—Direct*

In the summer, employees have their annual picnic, and a separate picnic is held at the same time for colored employees. They have various athletic facilities provided, and in every respect the greatest consideration is given to the facilities for employees' recreation.

A women's auxiliary, comprised of the wives of employees, is also sponsored and encouraged.

Employees with 20 years or more of continuous service are admitted into a veterans' association. As of January 1,
7289 1940, this association had 444 members. That, I think, is quite a striking tribute to the average length of service of the employees of this company.

A savings and loan association, which operates in the State of Missouri as an institution for investment of employees' funds, and as a lending agency to assist employees in financing their homes, is also sponsored.

I was one of the charter members of that association, and I can say sincerely that I believe it is one of the best institutions that the company has promoted and fostered from
7290 the viewpoint of the benefits that the employees have received. A very large percentage of the employees are making regular

contribution to it, and they have built a large number of homes.

As of December 31, 1939, the assets of the association had accumulated to $3,299,535. There were outstanding at the time 1,046 loans, all of which represent houses which the employees are buying and making payments on through the association. I say "all of which", and I should say all

but a very few of which. The total of these outstanding loans represents $3,118,635.

Dividends to shareholders during 1939 averaged 6.67 per cent.

It is necessary for the association as of the present time to refuse to take any additional contributions in certain classes of stock unless accompanied by request for loans. By that I mean that they do not desire at the present time to have depositors who are not installment stockholders or borrowers. There have been times, of course, where the association could use funds, because they had a large demand for loans, but the low rate of interest in other possible investments makes the association's rate very attractive and the group is handling the matters of the association in such a way that the employees themselves derive the benefits, and particularly those employees who are saving their money to buy a home. 7292

The American Legion Post was founded several years ago among employees in St. Louis and the surrounding territory. This Post is extended the privilege of having its

—3,090— 7293

meetings in the main office building, and is given every encouragement in its activities.

—3,091—

Employees who desire to make small loans may borrow small amounts of money to meet some emergency. This loan can be obtained from the company, and repayment without interest is handled by payroll deduction. That covers a small amount of money that an employee may need temporarily. They do not charge any interest for that.

Pensions are paid to employees under a voluntary, non-contributory plan. These pensions have a maximum of $50 a month, and are paid to employees retired between the ages of 60 and 70 years. Consideration is at the present time being given by the management to the establishment of a more comprehensive insured plan on a contributory basis. The plan has been developed fairly completely and is being examined and analyzed by the employees at the present time, and it is expected to be in effect in the near future.

7295 The group insurance feature is extended to employees, and has no company contribution feature involved in this particular insurance. It is merely an opportunity for employees to obtain various forms of life insurance, frequently term insurance, at rates much below that which they could obtain if they went individually to get the same insurance. In other words, insurance companies recognize Union Electrip Group employees as a high preferred risk, because they all have to withstand or undergo a physical examination as a part of their entrance requirements into this Employes' Mutual Benefit Association, in addition to which they have

7296 —3,092—

medical and dental care, as previously mentioned; and the record is such that the insurance companies, when taking the employees as a group, have offered some very attractive rates.

This represents no contribution on the part of the company, but merely an opportunity extended to the employees to acquire insurance at low rates.

The Employes' Mutual Benefit Association has contracts covering a sickness and accident insurance plan in which some 1,600 members participate. Employees in the East St.

7297

Louis and Alton divisions of the Union Electric Company of Illinois and of the Mississippi River Power Company, and Iowa Union Electric Company, also enjoy opportunities for this life insurance protection.

Sick leave is granted to monthly paid employees to the extent of the number of working days in a two weeks' period, without any deductions from salary. An additional allowance is made in particularly meritorious cases. While hourly paid employees receive no wages while absent from work, efforts are made, within the limitations imposed by working 7298
schedules and the provisions of the Wage and Hour Law, to allow them to make up their lost time.

Q. What is the record of continuous service by employees in the group? A. The average period of service for the employees in the Union Electric group is 11 years. More than

two-thirds of the employees have been in service 5 years or longer, and over half of them ten years and over, and more than 10 per cent. for 20 years or longer.

Q. You previously indicated that the Union Electric 7299
Company of Missouri does a steam-heating business. Will you state why that steam-heating business was developed by Union Electric Company of Missouri? A. It gradually grew into the steam-heating business as the result of supplying electric service to customers who had been running their own steam-heating and electric generating plants in the larger downtown buildings.

It originally began to supply steam service in the decade between 1900 and 1910. To obtain the electric service load of this type of user, it was generally necessary also to

undertake to supply steam for heating or process purposes which the user had previously obtained in connection with his power generation. Initially such service was provided by using the boiler equipment purchased or leased from the concerns who had discontinued the operation of their own generating plants. This was costly and required maintenance and upkeep on a large number of independent isolated plants, and in 1909 several of these isolated plants were connected through underground mains with a steam power
7301 plant at Tenth and St. Charles Street in the City of St. Louis.

—3,094—

From this start in central station service, the network of underground steam lines grew, until in 1924 it was connected through a large main to the Ashley street power plant which is located down on the river, and has been previously discussed.

Thereafter the major steam requirements were supplied from that point, and in 1931 a second large feeder main was constructed from the Ashley street plant, connecting with
7302 this Tenth Street plant, to provide additional steam capacity and to further improve the reliability of the service.

Q. How extensive is the steam-heating service? A. The steam-heating service as now operated has 414 customers, and the distribution system includes 72,400 feet of mains, together with the necessary regulating, metering and auxiliary equipment, with a total investment of approximately two and one-half million dollars.

The customers have a connected radiation, that is, the number of square feet of radiators connected to the steam

7303

system, amounting to 2,860,000 square feet, and are heating a total volume of 239,000,000 cubic feet. The normal annual sendout from the steam-heating plant in town is in excess of 1,000,000,000, and the peak hourly demand is slightly over 600,000 pounds of steam.

The system covers the downtown section of St. Louis. 60 per cent. of all of the buildings which are immediately adjacent to these steam lines are supplied heat by the Company. All but one major hotel in downtown St. Louis, and

—3,095— 7304

all main department stores, are served.

The department includes 47 employees. The average length of service with the company is 14 years.

The steam business in St. Louis is just incidental and a necessary operation on the part of the Union Electric Company of Missouri. It is a case of having to supply the service or run the possibility of not being able to suitably supply all the requirements of the customer, in which case there is no doubt that we would not be able to obtain all of the electric service which we now supply.

Q. Explain that, if you will? A. If the customer has to 7305 put in his own boiler plant, and if we are not able to supply all of his requirements, it is only one more step for him, if he has to have his investment in boiler plant and the operation expenses of employees and the handling of purchasing of coal,—it is only one more step to install a generator and produce at least part of his power requirements, possibly the greater part of them, during the heating season.

The revenues from these heating customers amount to about $800,000 for steam, and the approximate annual rev-

enue from the same customers is in the neighborhood of $1,000,000 for electricity. So the services are just a direct adjunct of each other.

—3,096—

The benefits to the customers are better service and better use of their floor space in their own building, which is quite an item, and from the standpoint of the public it eliminates the handling of large quantities of coal by trucks in the streets, and it eliminates a large number of individual plants,
7307 which is a major asset in the reduction of the smoke nuisance in St. Louis, which is quite serious.

The generation of steam at our Ashley Street plant, through some large modern boilers there, equipped with Cottrell plants, will in the future almost entirely eliminate the smoke which would have been made by all of these independent plants.

So that the steam business is just an incidental business in connection with the electric, but it is entirely appropriate to it, that it is a parallel operation.

There are many advantages in this joint operation. The
7308 company has a large force of trained engineers and maintenance men, and they are available not only to the steam-heating department for its own work, but to act as consultants with the customers and help them improve their operations.

As a means of adding economy to the customers' operations, we have spent considerable time and effort in going over his heating problems with him and improving his efficiency. In other words, it is not our purpose to see how much we can make the customers spend for steam heating, but to keep the overall costs of his electric and steam service within

limits so that he is a satisfied customer, and so that we know

—3,097—

we can retain the business. And in doing that, nobody benefits by a lot of steam that is wasted, and the pounds of steam per season, per cubic foot of volume heated, have been materially reduced as the result of this activity.

Q. Now in what other respects are the electric and the steam properties jointly operated? A. Well, the officers and executives of the electric company, the Union Electric Company of Missouri, function for the steam-heating department 7310
and it does not increase the cost to the company because the same individuals would be required without the steam company. It is not sufficient in volume to cause any actual increase in executive expenses, but it does give the benefit of their advice and assistance.

It maintains an operating organization somewhat independent of the electric operating department, but under the general supervision of the electric company's supervisor. In all other respects, except that, the general organization of the electric company—by that I mean the Union Electric Company of Missouri—functions for both departments and 7311
requirements such as general accounting, billing, purchasing, stores, sales, legal advice, transportation and so on, are all furnished to the steam group.

The underground construction crews of the electric company, including all equipment, are used frequently and extensively in the construction of steam mains and feeder un-

—3,098—

derground work.

We already have those trained crews for putting in conduit lines, and the steam company can get the use of them.

The common facilities of the Ashley Street steam boiler plant are made available. That is the chief benefit of joint operation because, as I have previously explained, the Ashley Street station functions as a steam reserve station for our hydro system, and the minimum power output from the hydro system occurs in the summertime, in the dryest year on record, and at that time the steam-heating requirements are at a minimum. The result is that the two can function with very little overlapping and to make use of practically the
7313 same equipment. There is also an offset between the hour of peak steam-heating demand, which usually occurs early in the morning, trying to get the buildings warmed up, and the maximum demand on the electric system, which occurs at about 11 o'clock in the summertime and after the steam-heating load has completely gone off in the winter, in other words, at about 4:30. So that there is a high degree of diversity between the steam and electric requirements, and it particularly fits in with the summer low-water season in the hydro plants.

The result is that if the steam company were to be
7314 operated separately, they would have to have a separate steam-heating plant which would cost in the neighborhood of $1,290,000. We would have to—and by "we" I mean the Union Electric Company of Missouri—would have to retain

—3,099—

the Ashley Street station in practically its present size as a steam reserve for hydro operations. The result is that the combined operations of the two functions in the one plant are economical and proper.

Q. Before you leave the joint operations, let me ask you one or two more questions. Do the buildings operated by

7315

the Union Electric Company of Missouri receive steam heat from the steam department? A. They do. They receive it at the cost of production, and not at the retail rates at which steam is ordinarily sold; so they benefit to that extent.

Q. And are office facilities provided by Union Electric Company of Missouri for its steam-heating department? A. They are provided, but the cost to the company for those offices is allocated at cost without any overhead to the steam-heating department. But the net result of this is a material savings to the steam-heating company. They couldn't main- 7316
tain offices such as they have for the price they are paying.

Q. State if you will the approximate amount of savings arising out of the joint operations of the steam and electric businesses? A. As the result of making a fairly detailed estimate of a number of small items which indicate the savings obtained by joint operation, the round figure total for a group of miscellaneous items is $13,000 a year. This particular group of items, briefly mentioned, includes the use

—3,100—

of the general office building space and facilities, the services of the general accounting, billing and collections department, 7317
including the credit and adjustment work; purchasing facilities; the handling of material for the steam department by the electric stores group; the machine and utility shops; and miscellaneous services. All of those combined represent an annual saving of about $13,000, somewhat over $13,000, on a conservative estimated basis. This is a saving to the steam group as compared with separate and distinct operation.

Now the saving which I would estimate as the result of the joint operation of the Ashley Street generating station is

that of the fixed charges on a separate steam-heating plant. The steam cost billed to the steam company from the Ashley Street station is billed at cost, and the equipment and boilers and facilities are such that it could produce steam there as cheap or cheaper than it could anywhere else. If we had to build a separate steam-heating plant it would have to be built in a different location and water supply facilities would not be as good as they are at Ashley Street. So that I am very conservative when I say that the steam department
7319 would have to bear the fixed charges only on the new plant. I doubt if they could produce the steam quite as cheaply there as they now get it. Those fixed charges on $1,200,000 at a very conservative figure of 10 per cent. total per year, to include interest, taxes, depreciation, and such items, would

—3,101—

amount to $120,000 a year. The actual charge billed against the steam department for what may be regarded as the equipment fixed charges for the Ashley Street plant amount to about $36,000. The actual figure for the past year is $36,112. This results in a saving of $84,000 in round figures.

7320 —3,102—

Now in addition to the two items which I have mentioned, there would be a large number of small miscellaneous items which I have not attempted to detail exactly, but I would say that they would far exceed $3,000 a year, with a total then in combined savings being estimated at $100,000 for the steam group as compared with independent operations.

In addition to that, there is an economy to the electric company itself, these savings here having been those expressed in terms of the economy that the steam group gets.

7321

The electric company has a problem in the operation of the Ashley Street plant that the same crew has to be kept there at all times that is required for regular operation. The boilers and equipment such as are used today operate with automatic equipment, that is the pulverized fuel operation and the automatic heat control equipment, so that about the same operating force is required whether you are carrying a light load or a full load. The result is that if we are carrying the maximum output from the plant, the men themselves do not do anything different than if they were running 7322
on a very light basis. During the period in which the Ashley Street plant is not used for generation, but is carried as a stand-by plant solely for immediate operation on notice, the electric company would have to bear the entire cost of the operating crew and miscellaneous expenses, if it were not for the fact that the steam department can use steam during those periods, and does.

—3,103—

It is not possible to provide an exact estimate of this saving for the simple reason that it is impossible to say just 7323
how much generation an electric company will do in an average year. If no generation were done for an entire year, these savings would represent possibly $134,000. If, on the other hand, the operation was continued for half a year, it would reduce that amount to about one-half.

Now the method by which I arrived at that figure is this. The present monthly payroll at the Ashley Street plant for operation and maintenance is about $16,400. Under the present basis of apportionment of cost between electric and steam service accounts, the electric generating accounts

absorb about $5,167 per month, including $4,154 for operating labor and $1,013 for maintenance. I just picked these out from the 1939 operations. The excess of $11,233 of monthly payroll expense is to a large extent absorbed by the steam service accounts, when no electric generation is done. That is, in other words, they bill the steam company at actual cost for the steam produced, and if there happens to be a little generation they get most of the charges. At the same time the electric company would have to bear the same expense
7325 in any event.

So that I would say that within the limits of possibly $50,000 a year minimum and $135,000 maximum, that some figure in the neighborhood of $75,000 to $100,000 would be a fairly reasonable estimate.

—3,104—

Q. Now this represents a saving to the electric business? A. That is right. In other words a combined saving which it appears to me would be a fair estimate as a combined total saving to the group might be taken to be at a maximum of $200,000, and probably not less than $150,000 or $175,000
7326 at any time.

Q. Are there similarities as between the electric and steam-heating business with regard to demands for continuity and character of service? A. Oh, they both have the same general problems. It is a little more difficult to provide continuous electric service than it is continuous steam service, but in general they have similar problems.

They both use the public streets, and they both are regulated alike, and they both involve the selling and delivery of a service, rather than a commodity; and they are both patronized by most of the communities in the area served.

7327

Consequently, where such two utility services are operated jointly, there is an economy in the supplying of the service, and a benefit to the customer. You only have one group to deal with, and only one man is required to read the meters, and in general it is advantageous to all parties to maintain such service.

As a rule, the supply of steam service is not generally regarded as a particularly profitable business. All the advantages and economy from this joint operation are reflected in the rates and quality of service so that the consuming 7328
public is the one who is ultimately benefited thereby.

—3,105—

Q. In order to get a picture of the trend, if any, in the steam-heating business, will you state a comparison between steam-heating revenues and output and number of customers, between the year 1930 and the year 1939? A. Well, for the year 1930 the heating revenue was $755,596. At that time there were 287 customers who used 887,763 M pounds.

In 1939 the heating revenues were approximately the same, being $750,510, with steam sold being 870,329 M 7329
pounds. The number of customers at the end of the year 1939 was 390.

You will notice that there was a slight reduction both in revenue and in steam sold, but in general the business has been fairly uniform. The largest year was in 1937 when the revenue went to $828,956, and the steam to 1,004,699 M pounds. The amount of those items is a function of the temperature, it is a matter of how cold a year we have.

Q. Those statistics are exclusive, are they not, of the steam-heating business conducted by the Cupples station

7330 *Stanley Stokes—By Respondents—Direct*

Light, Heat and Power Company? A. Well, they are, but you wouldn't be able to detect the difference hardly if you added that in. The Cupples Company has 11 steam-heating customers in one block of buildings, and obtains its steam from the steam-heating mains of the steam division of the Union Electric Company of Missouri.

I explained that there was a little generator operated in

—3,106—

7331 this Cupples block, and I do not recall that I did explain how that energy, generated by that little generator is sold back to the Union Electric Company of Missouri.

Q. I think you have explained it. A. All right.

Q. Now when was Union Colliery Company organized, and what does it do? A. Union Colliery Company was organized in 1917. It carries on a coal mining business and sells coal to the Union Electric Group and to outside users.

It is a mining company of considerable size, and well regarded in the State. It is located in the State of Illinois, near Duquoin.

7332 Q. Has it been a subsidiary directly or indirectly of Union Electric Company of Missouri, since its organization? A. At the present time it is a subsidiary of the Union Electric Company of Illinois, which in turn is a subsidiary of the Union Electric Company of Missouri. It has, to answer your question generally, been a subsidiary.

Q. Of Union Electric Company of Missouri, since its organization? A. Yes.

Q. Now very briefly state what properties the company owns and operates? A. The company owns and operates this

mine to which I have referred, located near Dowell, Illinois,
—3,107—
about 85 miles from St. Louis, in a southeasterly direction.

The present operations are in the field generally referred to as the Franklin County field. This coal in this field is of better grade than the coal in and around St. Louis. Coal is removed from what is known as the Illinois seam No. 6, which varies from 7 to 12 feet in thickness, and the quality of coal compares favorably with the best in Illinois, being low in sulphur and high in heat content for an Illinois coal. 7334
It is entirely satisfactory coal for use in all the company's steam plants.

The company—that is the Union Colliery Company—has under consideration leasing additional tributary coal lands to the west and south of the present mine, of approximately 3,000 acres. It also owns coal rights to 18,000 acres of land containing about 25,000,000 tons of coal, which location is only about 25 miles from the St. Louis switching district.

The property of the mine is wholly mechanized and electrically operated throughout. In fact, the mine is as modern as any mine in Illinois. It has complete automatic skip 7335
hoists, and the interior of the mine is completely equipped with electric haulage and electric loading is done with mechanical loaders, and in every respect it is a very modern mine.

Underground hauling is done by electric locomotive. As a result of the relation of the Colliery company to the Electric Group, we naturally do the electrical engineering for the
—3,108—
mine, and I believe that if you were to visit this mine you

would see some striking differences in method followed, which are somewhat different from those frequently carried on. In other words, they have automatic sub-stations located down in the mine, and feed them at somewhat higher voltage, and in every respect, carry on about the same type of distribution we ourselves use above ground, only taking the special precautions which are necessary in mining work.

The trackage underground is completely equipped with special electric interlocks and means of cutting off one sec-
7337 tion of the track in case trouble exists on the trolley or rail system, which is not customary in most mines.

The daily capacity of the mine is rated at 5,300 tons. Production for the year ended June 1940 was 1,305,000 tons. The property account of the Union Colliery Company as of September 30, 1940, amounted to approximately $2,375,000.

Of this 1,305,000 tons to which I referred as the production for the year June, 1940, 1,260,000 tons was salable, the rest being lost in waste cleaning, that is in washing, and a certain amount of use at the mines.

The sales of this 1,260,000 tons were approximately
7338 divided into 1,010,000 tons to the Union Electric Company of Illinois and the Union Electric Company of Missouri; and 250,000 tons to outside customers not connected with the Union Electric Group. That is, in other words that the sales

were approximately 80 per cent. to the Union Electric Group and 20 per cent. in the ordinary coal markets.

The average revenue from coal sold to the Union Electric Company of Illinois and the Union Electric Company of Missouri, was $1.706 per ton, and to outside customers—

$2.23 per ton. You see the Union Electric Group take screenings and a little lower grade of coal, whereas the outside customers are regular coal customers for prepared sizes. A good deal of that coal goes to the Chicago district.

There are about 600 men employed, and the mine is the chief source of income for the population around Dowell, Illinois.

Q. Now you have stated the annual output for 12 months ended June 30, 1940, and given for that period the relative sales to the Union Electric Group and outside. Please give 7340
us comparable information, very briefly, for a preceding period. A. I have available the sale of coal over the last 10-year period, and I will just sketch the tonnage roughly.

For the year 1930 the tons sold were 1,159,314. That varies for reasons which I shall explain shortly. It has reached the lowest, in the year 1933, at the bottom of the depression, and pretty low in 1935. Those years were not only depression years, but they also represented fairly good hydro years. I will go into that in a moment.

By 1939 the sales had again become 1,041,561 tons. For 7341
—3,110—
several years during that period the sales had exceeded 1,000,000 tons.

Q. Now if you will, a very brief indication of the range in gross revenues during the period you have indicated. A. The gross revenues have varied from a minimum of about $813,000 in 1932, and slightly more than that in 1933, to $1,914,000 in 1939.

In general, out of the 10 years, for eight years out of the 10, the revenue has exceeded $1,000,000 a year gross.

Q. Now in percentages, the amount of coal produced, sold within the Union Electric Group, and the amount sold to others. A. I have stated the division for one year as being roughly 80 and 20 per cent. It doesn't vary greatly from that, but I will state the distribution for a five-year period by years.

In 1939—75.4 per cent. was sold to the Union Electric Group, with the remainder of 24.6 per cent. sold outside.

Similarly, in 1938—73 per cent. to the Union Electric
7343 Group; in 1937—69 per cent.; in 1936—71 per cent.; and in 1935—63 per cent. was sold to the Union Electric Group, and principally the Union Electric Company of Illinois and the Union Electric Company of Missouri itself.

The explanation which I wanted to make with regard to the wide fluctuations of the supply of coal and the demand for it, has to do with the correspondingly wide fluctuations in hydro power for the Union Electric Group, and on short notice they call the coal company up and tell them that they

will not need the anticipated coal next month, or that they
7344 will need twice what they anticipated. This is a difficult situation for a mine to accommodate itself to. It requires that it go out in the open market frequently and buy additional coal to meet our demands, and then again that it reduce its operations rather suddenly and endeavor to find an outside market quickly for shipping the coal. They have been very successful in meeting these requirements, but they would not be readily met by contracts with outside coal mining companies.

Q. Does the Union Electric Group buy all of its coal from the Union Colliery Company? A. No, it buys most of it. As

7345

I indicated, there are times when the company buys coal in the open market. Usually the Colliery Company purchases the coal for us because they have more experienced men in this particular work.

Q. Now in general, what are the bases for charges for the coal made by Union Colliery Company to the Union Electric Group? A. The basis of the charge for intercompany sales has in the past been such that the price paid by the Union Electric Group would be no greater, or nearly the same, as could be determined, as that which they could have obtained 7346
from contract with outside suppliers. In other words, in all cases the coal has been sold to the Group in competition with the best responsible contracts which could have been secured with equivalent satisfactory coal. As a result of the passage

—3,112—

of the Guffey Coal bill, the so-called intercompany sales, or sales to the Group, will be, of course, determined by the prices stipulated in the Guffey bill. So that that is a rather definitely defined basis.

—3,113—

The reasonableness of charges made prior to the establishment of the Government prices is indicated by the fact 7347
that with the establishment of these minimum fair prices, the effect does not change the prices to the group by more than 2 per cent. on either coal delivered by the colliery company or on coal which they purchase on the outside. That merely demonstrates that the method of pricing has been fair and accurate and corresponds with the prices set when the Guffey Bill went into effect.

The Examiner: Let us take a short recess.

7348 *Stanley Stokes—By Respondents—Direct*

(Whereupon, a short recess is taken, after which the hearing is resumed.)

The Examiner: We will resume.

By Mr. Hamilton:

Q. Now, Mr. Stokes, what advantages are there to the Union Electric group out of the ownership and operation of the Union Colliery Company? A. Well, I have previously
7349 described the wide variation in the requirements for coal brought about by our hydro power, and the fact that we can make that kind of an arrangement with a company which is owned by the group much more satisfactorily than with an outside concern.

In addition to that, the control of our source of coal supply by the ownership of the mine is an insurance against a shortage of coal, and a protection for our customers.

—3,114—

It is quite an item to be able to control the source of your own supply of a commodity which is the most important
7350 of anything with which we deal.

Q. Now, when was St. Louis & Belleville Railway Company organized? A. The St. Louis & Belleville Electric Railway Company was organized in—well, I can't say exactly when it was organized, but I can state when it came into the control of this group.

Q. All right, state that if you will. A. The first connection which this group had with it occurred when it acquired the control in 1922. It had been a part of what was known as the local railway and suburban system there, and the control dates from 1922.

7351

Q. Now, what does the company do and where does it operate? A. The company owns and operates a freight line, a short line of 11 miles in length, single track, which runs from a point in East St. Louis, at which it connects with the Terminal Railroad Association, and other railways, including the Alton and Southern Railway, and the Southern Railway Company, from this point of connection to a point not far from Belleville, Illinois, a distance of 11 miles.

At the southeastern terminus, that is the point near Belle-
ville, it connects with the Illinois Central Railroad, over 7352

—3,115—

which moves practically all of the fuel consumed in the Union Electric plants. By "Union Electric plants," I mean those of the group.

The investment in the railroad property is about $1,300,-000, and it normally employs about 60 men.

Q. And what does its property consist of? A. In addition to the single track line described, it has the trolley and feeder equipment, and two heavy type electric locomotives, one an 80-ton and the other a 90-ton locomotive. This latter 7353
locomotive has just been recently acquired and reconditioned, and will handle 18 to 20—50 ton cars at a time.

It is a well operated little road, has fully automatic sub-stations for supplying the current which it purchases from the Union Electric Company of Illinois, and in addition to two such automatic sub-stations, one not far from either end, it has recently acquired a portable 3,000 kilowatt sub-station which is mounted on a railroad car and can be located as required.

7354 *Stanley Stokes—By Respondents—Direct*

Q. Have you stated how many coal cars the company owns and operates? A. The company owns several hundred which it uses itself and which it also leases out to other companies. There are about 450 steel and composite cars. It doesn't use all of those at all times for itself, but when the demand for coal is heavy it uses a large part of them, and the

—3,116—

rest of the time it leases them out and obtains some of its revenue that way by rental from other roads. As a matter
7355 of fact, the ownership of this group of cars is an additional insurance against the shortage of coal for the Union Electric group.

During the previous World War we, in company with other users of coal, had great difficulty in obtaining an adequate number of cars, and if such a condition again arises, these 450 cars would be adequate to handle our requirements.

Q. Now, you stated, Mr. Stokes, that the principal business of the company was the hauling of coal. What proportion of the coal hauled by the company is constituted of coal
7356 going into the Union Electric group? A. The records for the last five years indicate that about 88 per cent. of the 3,620,204 tons hauled, were delivered to plants of the Union Electric group.

The company, in addition to the revenue paid from the rental of these cars, gets most of its revenue from a rate division from the connecting lines from whom it receives coal shipments.

Q. State the range, if you will, of net income for the company during the period 1930 to 1939? A. The smallest

net income during that 10-year period was $19,000, and the highest $116,000, the average income for the 10 years being about $56,000 a year. At no time during the 10-year period,

—3,117—

which included the depression, did the road operate at a loss.

Q. I don't believe you have indicated the net income of the Union Colliery Company. Will you give us that figure as of a recent date? A. Well, for the year 1939, the net income of the Union Colliery Company was $61,408. 7358

Q. Does Union Electric Company of Illinois conduct a gas business, and if so, for how long a period has it conducted such a business. A. The gas business conducted in the city of Alton is owned and operated by the Union Electric Company of Illinois. It is a small gas business and is not a major part, at all, of the Union Electric Company of Illinois' chief operations.

The gas business has been an associated business with the Union Electric group since 1922.

Q. Now, you are speaking specifically of that business operated by the Union Electric Company of Illinois, are you not? A. That is right, in and around Alton, Illinois. It at one time had been the Alton Gas & Electric Company, which was acquired by Union Electric Company of Missouri, and merged with the Union Electric Company of Illinois in 1937, and the business has been carried on since that time in the name of the Union Electric Company of Illinois. 7359

—3,118—

Q. Now, very briefly will you describe the property owned and operated in gas service by Union Electric Company of

7360 Illinois? A. The business of the company in the gas distribution, that is the territory in which this business operates, is located in and around Alton, which has been previously discussed and located as a town line some 20 miles north of East St. Louis. The company buys its gas as a mixture of manufactured and natural gas, from the Illinois-Iowa Power Company, and its own manufacturing company is operated primarily as a stand-by in the event of failure of purchased gas.

7361 The gas purchased and distributed to the users of gas in and around Alton has a heat content of 565 B. t. u. The stand-by plant is a carbureted water-gas plant with a capacity in three storage holders of 299,000 cubic feet. The production capacity of the plant is 200,000 cubic feet a day.

The distribution system is rather simple and consists of 63 miles of main, 5,778 services, serving 5,020 customers as of December 31, 1939.

Fifty-four out of the 63 miles of main are cast iron low pressure, and 9 miles are high pressure main.

7362 The sales of gas in 1939 amounted to 75,300 m. c. f. for domestic purposes, and 21,200 m. c. f. for commercial use.

There are no house heating or major industrial customers in Alton.

—3,119—

Q. Is the gas business of the Union Electric Company of Illinois operated jointly with its electric business? A. It is. They are operated just in close parallel operation, the same personnel both as to managerial, commercial and in general, practically all functions. Meter readers serve both businesses and in every possible respect they are operated as

7363

though they were one company insofar as possible. They are one company, but I mean as though they were one business.

Q. Are there advantages arising to Union Electric Company of Illinois out of the joint operation of the two businesses? A. There are. Economies from the joint operation are the result of common use of every feature which is in any way possible. We have the same executive, same managers, the same maintenance groups, and meter readers, and collection system, and employees and so forth.

7364

Q. I want you to be a little more specific on that. Can you state the amount of executives' salaries apportioned to the gas business in 1939? A. Well, they only apportioned $1,583 of executive salaries in 1939, and that would in no way have provided adequate executive supervision had it been operated separately.

As another example, meter reading costs in Alton have been compared with those in East St. Louis, which is operated by the same company, and which has no joint gas service.

—3,120—

7365

The costs were 43.5 cents per customer in the Alton district, as compared with 52.9 cents per customer in the East St. Louis district, the difference being due to the use of common meter readers for both services.

Collection costs at Alton in 1939 were 38.3 cents per customer, compared to 44.7 cents in East St. Louis, which again shows the economy derived from joint billing and collection.

Q. There is also a factor that because of the small size of this property it would be unable to obtain expert personnel such as it is able to get from its associated companies, and it isn't only a matter of just the particular cost, but a small

7366

company like that could not afford the type of personnel that is available now to it. It can call on the Union Electric group in the electrical division for any electrical engineering work it may require, also on the mechanical groups and so forth. In fact, it can get an expert in almost every branch of its work, and that particularly applies to the assistance which it can get from the St. Louis County Gas Company, which will be discussed later.

7367 The joint operation, taken as a whole, in the company up there, affords very appreciable savings which have been estimated at $33,850 a year as the combined effect of such joint operation. That total is divided into the savings due to ex-

ecutive and department heads, sales, accounts, treasury department, distribution, storeroom and garage, and general office facilities. That perhaps doesn't sound like a huge sum of money when considered in the light of some of the figures we have been discussing, but it must be recognized that this is a small gas company.

7368 Q. Are there advantages to the customers of Union Electric Company of Illinois arising out of the joint operation of the two businesses? A. Well, any division of expenses which represents a saving to one company also represents a saving to the other. The best way to state it is that the economies of joint operation represent a certain overall saving which is distributed between the two groups and it affects each.

Q. Does the joint operation result in simplicity in meter reading and billing as well? A. It does, it results in simplicity and economy in all those operations.

7369

Q. In order to get an idea of the relative importance of the gas business, will you give us a comparison of the number of customers served, the gas sales and revenues, for the period 1930 to 1939? A. This gas business to which you refer is the gas business conducted by——

Q. (interposing) My question relates solely to the Union

Electric Company of Illinois. A. In 1930, there were 5,301 customers and there has been a slight decline, and by 1939 there are 5,020. The business has decreased slightly in the last 10 years, both in number of customers and in sales. The gas sales in m. c. f. in 1930 were 117,149; in 1939, there was a decline to 96,571.

7370

The revenue likewise declined from $180,037 in 1930 to $141,631 in 1939.

This business is a very small fraction of the business conducted by the Union Electric Company of Illinois, and as a matter of fact it is less than a half of one per cent., referring to revenues, of the consolidated revenue of the Union Electric group.

7371

Q. Does Iowa Union Electric Company conduct a gas business, and if so, how long a period has it done so? A. The Iowa Union Electric Company now operates a gas business which was previously known as the—well, I have got to correct that, the Iowa Union Electric Company which had a predecessor company known as the Keokuk Electric Company, operated a gas business in and around Keokuk. The Union Electric Company of Missouri, on January 6, 1926, acquired the interests which included this gas business. The business is now operated by the Iowa Union Electric Com-

7372 *Stanley Stokes—By Respondents—Direct*

pany, which is a direct subsidiary of the Union Electric Company of Missouri.

Q. State briefly what property the company owns and

—3,123—

operates, devoted to the gas business? A. The gas distributed in the city of Keokuk and vicinity is manufactured in a water gas plant whose capacity is 1,500 m. c. f. daily. The gas itself has a heat content of about 540 B. t. u. per cubic foot. The plant consists of two carbureted water gas sets,

7373 with the usual equipment, and a holder of 150,000 cubic foot capacity.

The distribution system has 33 miles of main which served 2,439 customers, as of December 31, 1939. The system of mains is cast iron and operated at low pressure. In other words, the pressure used is that at which the gas is used by the ultimate consumer.

In 1939, there were 40,500 m. c. f. sold and used almost entirely for domestic consumption. There is no house heating business and a very small amount of commercial business.

7374 Q. Are the electric and gas properties of the Iowa Union Electric Company operated jointly? A. They are, and the discussion which applied to the operations of the Union Electric Company of Illinois previously, with respect to the Alton Gas property, also applied to the joint operation of this gas company in which every opportunity available is taken advantage of to produce a more economical operation as the result of operating the two properties jointly with the same personnel and employees and facilities.

—3,124—

7375

Q. Now, do you mean by that statement that the advantages and benefits accruing out of joint operation in the Union Electric Company of Illinois are similarly applicable to the joint operations in the Iowa Union Electric Company? A. The nature of the operations and the nature of the advantages—I don't mean to say that numerically they are.

Examples of the economics of such joint operations can be given for the gas business at Keokuk.

—3,125—

7376

For example, executives' salaries apportioned to the gas property in 1939 were only $574. Obviously, it would not have been possible to have had adequate executives for that sum. The cost of reading meters in 1939 was 43.7 cents per customer, compared with 47.9 cents in Fort Madison, Iowa, which is the city immediately north of Keokuk, and which is operated by the same company, but does not have the joint benefits, only electric operations being conducted at Fort Madison.

52.9 cents per customer in East St. Louis, as compared with this 43.7 at Keokuk, which indicates similar benefits of joint operation.

7377

Collection costs in 1939 were 30.3 cents per customer for the Keokuk location, compared with 44.7 cents per customer in East St. Louis, where only electric customers are handled.

Billing and accounting expenses for the gas property amounted to 47.7 cents per customer as compared with 60.4 cents for East St. Louis—again where only electric accounts were handled.

7378 *Stanley Stokes—By Respondents—Direct*

They only render one bill in Keokuk to cover both electric and gas service, put them both on the same bill, the same meter reader, and there is a joint, parallel operation wherever possible.

This gas property is also a small property compared to the system of the electric property with which it is associated,

—3,126—

and again the matter of personnel is of interest. It would
7379 not be possible for them to have the same type of experienced and skilled supervision and employees to which they now have access on a part-time basis.

I can sum up the estimated savings of joint operation as being something over $10,000 per year as affecting the gas company. Again keeping in mind that it is a very small company, this represents a substantial amount.

Q. Are there benefits arising to customers out of the joint operation of the two businesses by the Iowa Union Electric Company? A. Yes, the customer has simpler service, he has to deal with only one group, and has contact with
7380 only one meter reader, and he can pay his electric bills and his gas bills at the same office, or if he sends them by check, only one check is required, and the same clerk will handle any requests, whether for electric or gas, or both, in the event the customer wants to move or get service at a new location; and in many ways it is convenient and beneficial to the customers.

Q. Now state, if you will, the trend in number of customers, gas sales and gas revenues, for the Iowa Union Electric Company during the period 1930 to 1939? A. This

7381

small gas business has decreased somewhat in the last 10 years, both as to customers and sales.

In the year 1930, it had 2,813 gas customers, with sales —3,127— of 60,533 m. c. f., and a gross revenue of $102,675.

By 1939, the number of customers had reduced slightly to 2,439, and the sales in m. c. f. to 40,466, with a reduction in revenue to $56,284.

This company had a revenue in 1939 of less than .2 per cent. of the consolidated revenue for the Union Electric Group.

7382

Q. Now you are speaking of the relation of gas revenue of the Iowa Union Electric Company? A. That is right. I wanted to point out that it is a very inconsequential part of the major operation.

Q. When was Union Electric Land & Development Company organized, and for what purpose? A. The Union Electric Land & Development Company was incorporated in 1929 to hold the land which it had been necessary, or would be necessary, to acquire as a part of the Bagnell Dam and Lake of the Ozarks hydro project.

7383

The portion of the land required for the project was to be conveyed to the Union Electric Company of Missouri, who owned the project, and the so-called excess land, that which had to be acquired but which could not be included in the power project, was placed in the Union Electric Land & Development Company, so that it could be sold as readily as possible.

If this had been placed in the properties of the Union Electric Company of Missouri, it would have gone under the

mortgages and it would have been difficult to make arrangements to sell it, and the intention is to sell this land and

—3,128—

liquidate this company as fast as it is possible to do so.

They are in the act of selling the land. The depression has interfered materially with the rapid sale of that land, because just at the time when there was the greatest public interest, we ran into the worst part of the depression, and people didn't feel able to purchase land which they did not

7385 have to have. This is largely useful for summer resort purposes.

They originally had about 70,000 acres of excess land, and that has been reduced to approximately 52,000 acres as of the present date. The actual acreage at the end of the year 1939 was very close to 53,400; and 1,418 acres have been sold in the first 9 months of 1940. So that, roughly speaking, 20,000 acres have been disposed of.

The company made every effort to make the purchase of this land attractive so as to be able to dispose of it, and they

7386 rebuilt one of the existing buildings at the site for a hotel, which they call the Holiday House. They also built a small restaurant at the south end of the dam, known as the Casino, and they provided boats and other recreational facilities to attempt to build up the attractiveness of that lake region. The lake itself is really a very beautiful body of water, and there is considerable recreation activity out there in the summer period, even in the late fall.

—3,129—

Q. Now state the total assets, if you will, of the Union Electric Land & Development Company as of a recent date?

A. The property and plant account of the Union Electric Land & Development Company as of September 30, 1940, was approximately $1,940,000.

Q. And is it correct to say that this is a liquidating proposition? A. It is. The intention is to liquidate this property as quickly as it can be done, without unnecessary loss or expense.

Q. Turning now to the St. Louis County Gas Company, will you state the date of its organization and when it became part of the system? A. The St. Louis County Gas Company 7388
and its predecessor have been in the control of the present owner, the North American Company, since its organization in 1904.

In 1912, the present company was formed to take over the assets of the original company, and the entire capital stock of this company, as well as that or the original company, has always been wholly owned by the North American Company.

It has thus been an associated business with the North American group, I mean the Union Electric Group, for about 36 years; that is, it has been under the direct ownership of 7389
the North American Company for that length of time.

Q. Now in order to get an idea of its relative importance and size, will you state as of a recent date the amount of prop-

erty and plant account of the company? A. The company had, as of May 31, 1940, an investment of $9,093,054 in its property and plant account. Its total assets amounted to $9,944,909.

In the preceding 12 months, the operating revenues were $2,378,135.

7390 *Stanley Stokes—By Respondents—Direct*

This company serves the major portion of St. Louis County and has 52,334 customers.

Q. Now state, if you will, the extent of the territory served by the St. Louis County Gas Company? A. The St. Louis County Gas Company serves approximately 62 square miles in St. Louis County, and in these 62 square miles there is located about 250,000 of the county's total population of, roughly, 273,000.

Included in this area served by the Gas Company are
7391 many good-sized cities. In particular, there are 6 towns there, some of which have been previously mentioned in connection with the electric business, but I would like to name them, because they are over 10,000 population, and are important to the St. Louis County Gas Company.

These are Clayton, Kirkwood, Maplewood, Richmond Heights, University City and Webster Groves.

The population varies in those towns from a minimum of about 12,000 to a maximum of over 32,000 inhabitants.

—3,131—

7392 In addition to the incorporated cities, large unincorporated areas are served. Some of these unincorporated areas are rather densely populated. They have a district known as Wellston, just outside of the northeastern city limits of St. Louis, which is more heavily populated than some of the city area just outside the limits, but it does not happen to be incorporated.

Mr. Hamilton: Will the reporter please mark this map for identification as Respondents' Exhibit No. 60?

(The document referred to was marked Respondents' Exhibit No. 60 for identification.)

By Mr. Hamilton:

Q. State, if you will, Mr. Stokes, what this exhibit represents? A. This exhibit represents the territory served by the St. Louis County Gas Company, and shows the extent of their major distribution system, including high-pressure mains, 4-inch and larger. Small mains and small services 7394
are not indicated.

The single-hatched area indicates the territory served by the high-pressure system, and the double-hatched territory in and around the city limits of St. Louis, indicates that served by the low-pressure system.

The heavy dashed lines are the high-pressure mains of 6 inches and larger, and the heavy dotted lines are high-

--3,132--

pressure mains between 4 and 6 inches in diameter, including all sizes from 4 inches to 6 inches.

Q. Has this map been prepared under your supervision 7395
and have the facts shown been taken from the records of the St. Louis County Gas Company? A. It has been so prepared, and the facts have been taken from the records.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 60.

Mr. Odell: No objection.

The Examiner: All right, the map of the territory described is admitted in evidence as Respondents' Exhibit No. 60.

7396 *Stanley Stokes—By Respondents—Direct*

(Respondents' Exhibit No. 60 was received in evidence.)

By Mr. Hamilton:

Q. State, if you will, what the trend has been in the business conducted by St. Louis County Gas Company, over a period of years? A. The business of the St. Louis County Gas Company has been consistently increasing, and is at the present time increasing even more rapidly than the popula-
7397 tion.

Q. Than the population of what? A. Than the population of St. Louis County, I should have stated. The population of St. Louis County itself has been previously stated

—3,133—

to be growing very rapidly, and this Gas Company is exceeding even that rate of growth. I could illustrate this very briefly by a few statistics.

In the year 1910, there were 5,210 customers with 126 miles of main and an annual sales in m. c. f. of 95,000.

7398 By 1920, the customers had increased to 13,569, the miles of main had increased to 286, and the annual sales of gas to 293,000 m. c. f.

For the year 1930, the number of customers had again increased to 38,510, the miles of main to 510, and the annual sales to 1,236,000 m. c. f.

By the year 1940, as of May 31,—this is for the 12 months ended May 31, 1940,—the number of customers has now become 52,334, with 658 miles of main and an annual sales of gas of 2,744,000 m. c. f.

The maximum daily send-out for this same 12 months' period, the highest send-out during that period, is 23,711 m. c. f. That is the highest send-out for any one day.

That is a rather remarkable growth, and very consistent.

The territory which is served by the gas company is largely residential, and the requirements are of that character, but there are included some commercial areas, and a few large industries, not many.

Space heating for residences is of major importance to this company, and they have been very successful in their 7400

—3,134—

efforts over several years to develop a high rate of house-heating by all of their customers. They do extensive advertising, and they have been very successful.

As of May 31, 1940, the division of customers and their use may be stated as:

Residential customers for ordinary domestic use only—45,138; those customers used 950,335 m. c. f.

Heating customers, including ordinary domestic usage—5,272; and they used 1,595,501 m. c. f. 7401

Commercial customers numbered 1,918, and used 134,464 m. c. f.

There were 4 industrial customers who used 63,271 m. c. f., and 2 street-lighting customers who used 286 m. c. f.

Q. Now may I inquire whether the number of customers you have just given is in each case at May 31, 1940, and whether the amount of gas sold is for the 12 months' period ended May 31, 1940? A. That is correct, the total of that group totals 52,334, which is the figure given for the number

7402 *Stanley Stokes—By Respondents—Direct*

of customers as of May 31, 1940, and the gas sold represents the 12 months ending with that date.

Over 5,000 of the 5,272 customers who used gas for heating, used it for heating residences, so that over 50,000 of the 52,334 total customers are residential customers. The importance of the heating load is very evident, because the

—3,135—

10 per cent. of the total customers which used heating, used 58 per cent. of all the gas sold.

7403

(Discussion off the record.)

The Examiner: We will recess until 2 o'clock.

(Whereupon, at 12:30 o'clock p. m., a recess was taken until 2 o'clock p.m., of the same day.)

—3,136—

7404

AFTERNOON SESSION.

(The hearing resumed at 2:00 o'clock p. m.)

Whereupon, STANLEY STOKES resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Will you describe briefly the physical properties operated by St. Louis County Gas Company? A. The gas 7406
manufacturing plant of the St. Louis County Gas Company is located at Shrewsbury in St. Louis County, Missouri. It has a capacity of 16,000 m. c. f. per day and the gas has a heat content of 800 B. t. u. per cubic foot. This consists of water gas which has been enriched principally with natural gas purchased from the Mississippi River Fuel Corporation which they convey by pipe line from Monroe, Louisiana.

The plant in which the manufactured portion of the gas is made was originally built in 1911 and has been considerably enlarged as the load developed. Until 1932 the gas manu-
factured and distributed was carbureted water gas contain- 7407
ing 570 B. t. u. per cubic foot. Since 1932 the gas distributed has been, as stated, with a heat content of 800 B. t. u. per cubic foot, being a mixture of manufactured water gas and natural gas.

(Discussion off the record.)

A. (Continued) The gas generating equipment consists of

five water gas sets. I shall not attempt to describe them in

7408 *Stanley Stokes—By Respondents—Direct*

detail. Each set has the customary auxiliaries, such as blowers, oil handling equipment, automatic and hydraulic controls.

They also have facilities for cleaning the manufactured gas, including purifying condensers and Cottrell precipitators as well as the oxide purifier.

Manufactured natural gases are stored in a holder, the capacity of which is 4,500,000 cubic feet. An additional holder which is under construction will be in service some-
7409 time during this month, sometime in November and will have a capacity of 5,000,000 cubic feet. Manufactured gas is withdrawn from the storage holders and pumped through the mixing plant with reciprocating compressors with pressures varying at 12 to 45 pounds, depending on the demand.

The compressor plant consists of seven single stage, dual acting, twin cylinder compressors having a total capacity of 1,414,000 cubic feet per hour at 40 pounds pressure. The compressors are driven with either steam engines or electric motors. The normal method of operation is largely by electric motor, having a total of 2,845 horsepower.

7410 As the compressed gas passes through the mixing plant it is mixed with the high pressure natural gas. Each gas is automatically proportioned by a means of Smoot regulators, so that the resulting mixture has a heating value of 800 B. t. u. per cubic foot regardless of the variations in the heating value of either the natural or the manufactured gas.

—3,138—

The operation of the regulators is automatically supervised by a Thomas calorimeter.

After leaving the mixing plant, the gas is passed through a 50,000 cubic foot spherical tank to further insure uni-

formity of the mixture before it reaches the distribution mains. Just before passing into the distribution mains the gas is conditioned by fogging with oil and hydrating with steam to prevent deterioration of the inside of the mains and the meters. Also, sufficient odor to enable a detection of gas leaks is imparted to the gas just ahead of the mixing operation.

Steam for the operation of the gas works is generated in the boiler plant which has a rated capacity of 1,395 boiler horsepower in four boilers, two of which are fired with either 7412
natural gas or oil and two with coal.

This boiler plant is augmented by a total of 610 boiler horsepower from waste heat boilers, on the water gas sets. Power is obtained from the Union Electric Company of Missouri through a 750 k. v. a., 13,200 volt sub-station, that part being 25 cycles. Sixty-cycle power is obtained directly at 4,000 volts for a 700 horsepower compressor and through a small sub-station for miscellaneous uses.

The distribution system, itself, consists of 118 miles of cast iron low pressure mains and 540 miles of high pressure steel mains, 595 miles of services and 55,289 meters. The 7413
—3,139—
distribution mains are divided into two parts, one being the low pressure grid of 118 miles of cast iron pipe which ranges in size from four inches to 20 inches, covering a strip of territory immediately outside the city of St. Louis and indicated on Exhibit 60 by the cross-hatched area.

The other part of the system consists of high pressure mains totaling 540 miles of steel and wrought iron pipe in sizes from an inch and a quarter to 12-inch, which surround, more or less, the low pressure area and which extend to the

7414 *Stanley Stokes—By Respondents—Direct*

more remote parts of the territory. On the exhibit the smaller pipe was not attempted to be shown; nothing here below four inches was indicated.

In the low pressure part of the system gas is carried at pressure suitable for direct delivery to the customer's appliances, normally five inches of water column. The pressure carried in the high pressure system varies from 12 or 15 pounds to as high as 45 pounds per square inch, depending on load requirements, and is reduced to five inches of water
7415 column by governors located on the customer's premises.

All of the gas sent out from the plant is pumped into the high pressure system and the low pressure grid is applied from it through district regulators located at 13 points throughout the grid.

At three outlying points on the high pressure system there are high pressure storage holders, each of 50,000 cubic foot

—3,140—

actual volume. Those are large spherical balls. They are like a balloon when you see them from a distance.

7416 In the low pressure section services are mostly of inch and a quarter steel pipe with a total length of 157 miles, and in a high pressure area, they are usually three-quarter inch steel pipe with a total length of 438 miles.

As of May 31, 1940, the company had 55,289 meters installed of which 52,367 were active.

The general office building, which houses the St. Louis County division of the Union Electric Company of Missouri, as well as the gas company, is located at Webster Groves. It is a two-story structure containing 44,200 square feet of floor space of which 30,300 are used for office purposes, the

remainder being occupied by store room, meter stops and a garage.

By Mr. Hamilton:

Q. That building is the property of the St. Louis County Gas Company? A. That is right.

(Discussion off the record.)

The Witness: There are store room facilities at three locations, garage facilities at four locations, sales offices are maintained at five locations for the convenience of the customers where they can have the service turned on or off or pay bills or purchase merchandise. 7418

—3,141—

By Mr. Hamilton:

Q. Now, is the demand imposed upon the gas system uniform throughout the year or does it fluctuate? A. It fluctuates widely because of the extent of the gas residential house heating. Over half of the gas sold is for space heating for residences and the demand for that, of course, is a function of the temperature and is very heavy on cold winter days. In the past winter, the maximum daily sendout was 23,711,000 cubic feet compared with the 1939 summer minimum daily send-out of 2,727,000 cubic feet. The average daily send-out in 1939 was 6,867,000 cubic feet. Such wide fluctuations on the system are handled by varying the pumping pressures to suit the load conditions. 7419

This advantage is derived from the adoption, years ago, of the high pressure system of distribution in which this company was one of the pioneers. If the conventional low

pressure system of relatively larger cast iron pipe were used throughout the territory, a large increased investment would be required to provide larger mains which would be needed for the most part only to carry the winter load on those very few cold days which occur each winter. That is, a high pressure system is much better adapted for house heating service where the variation in the load is a large percentage.

At the manufacturing plant these fluctuations are met by simply starting up or shutting down the water gas sets as re-

7421 —3,142—

quired. These sets can be started up on relatively short notice and can be shut down with moderate standby losses, so that the plant, as a whole, was designed to fit nicely the demands and requirements of gas house heating.

Q. You have indicated that natural gas is mixed with the manufactured product. Has provision been made in the system for operation in the event of failure of the natural gas supply? A. Yes, there is always a possibility, although rare, that the natural gas line may be disturbed or the supply of gas shut off. For such emergency the reserve of natural

7422 gas and manufactured gas is stored in holders to meet temporary shortages and there are other provisions. Also, there is a store of 410,000 gallons of gas oil which can be gassified in the gas-making machines to enrich the manufactured blue gas, which is the carbureted water gas, should the natural gas fail. By this means a portion of the natural gas in the mixture distributed can be readily reduced from about 75 per cent. to about 45 per cent., thus making the available storage of natural gas last longer. Even without any natural gas, the oil-enriched manufactured gas alone could be distributed in an extreme emergency.

7423

In addition to that, 160,000 gallons of butane are kept on hand at all times to be used as stand-by in the event of long interruption in the supply of natural gas. Butane is a gas which is a liquid at ordinary temperatures and at a pressure of around 30 or 40 pounds and you can keep it in cylinders. It evaporizes readily into a gas and this quantity

—3,143—

has equivalent heat content of 16,890,000 cubic feet of natural gas.

7424

By making certain changes in the production of the water gas and using butane as an enricher, a resultant mixture satisfactorily substitutes for a normal mixture which is distributed. Further supplies of butane can be quickly obtained by rail if required.

As an example, in the eight years of operation with natural gas there has been one pipe line failure due to a washout and it required 12 hours to repair. In the meantime, the natural gas remaining in the pipe line between the break and the plant, together with the local storage, sufficed to continue operations on a normal basis without using any of these other stand-by facilities.

7425

Q. Has St. Louis County Gas Company kept abreast of developments in the gas transmission and distribution service? A. The St. Louis County Gas Company has not only kept abreast of developments, but I believe it is a correct statement that they have been in the forefront of developments and have even pioneered in the extensive use of the small diameter steel pipe. This carries gas at higher pressures right to the customer's premises and some of it was used when the company first started operations in 1904. The

territory then was sparse and we had very few customers per mile of main, and even now there are only about 80 customers per mile of main so that the customer density is not

—3,144—

very high.

The present low pressure grid serves 153 customers per mile and the high pressure 63 customers per mile of main, the lower cost, small size high pressure pipe results in a substantially lower investment per customer, where it is
7427 most needed to make gas available economically in the more sparsely settled areas.

There are many areas in St. Louis County where, if it had been necessary to extend the low pressure cast iron system, it would not have been economical to do so, and if the customer had obtained service it would have been at higher cost.

When the natural gas was made available to the St. Louis district, the gas company very promptly took advantage of it and began to use it. Savings resulted in both production and distribution costs and were passed along to the customer in reduced rates for all classes of service. The reduction in
7428 rates for gas house heating applications has brought that cost down to where it is within the economic reach of over 10 per cent of the residence customers. That is a very high use of gas house heating.

The use of the water gas method of manufacturing was adopted in the construction of the original plant as well as in its extensive additions since that time, largely because of its recognized greater flexibility to meet rapidly changing conditions. Consequently, when it became necessary to provide an emergency stand-by against interruption of the

—3,145—

natural gas supply, this plant has a very low operating cost and meets the stand-by requirements exceedingly well.

Coke oven plants or other types of plants are difficult to shut down and start up quickly and they must be kept in fairly continuous operation.

The water gas plant can use various fuels, too, such as gas, oil, butane and so forth.

Q. Will you characterize the service rendered the customers by the St. Louis County Gas Company? A. The St. Louis Gas Company is a very modern and efficient company 7430 and gives the customer a very high grade service in all respects. The personnel of the company are highly trained and it is a wide-awake, active, up-to-date company.

The effect of the gas house-heating has been to produce a large winter peak, whereas in the early days of the company's operation the peak used to occur in the summer when people were putting up fruit.

The high pressure system also makes it simple to maintain adequate and uniform pressures throughout the district. They have modern equipment for cleaning the gas and the care with which it is reduced eliminates almost entirely the 7431 naphthalene which sometimes has a tendency to stop up the pipes, but there is very little of that in this gas. The gas, itself, is also comparatively dry, free from water vapors. They have a tendency to freeze in extremely cold weather.

—3,146—

That phase of this dry gas has been improved by the use of the natural gas. It is better than it used to be before they used the naphtha gas.

Q. Is the gas service supplied by the company confined to St. Louis County? A. It is.

7432 *Stanley Stokes—By Respondents—Direct*

Q. It does not reach into the City of St. Louis, proper? A. No, it does not.

Q. Will you indicate, very generally, the nature of the rates charged and, if you are able to do so, make any comparison of rates? A. The rates are, in general, low. The cost per thousand cubic feet used by the average customer for ordinary domestic purposes is lower than it would be in the city for the same class of service.

Q. Now what city are you referring to? A. The City of
7433 St. Louis. They would be about 20 per cent. less than they would for that same class of service in the city. Such a customer in St. Louis County uses 1880 cubic feet per month, which costs $2.18. In the city this same amount of gas would cost $2.63. The average rate received per thousand cubic feet sold for all purposes in 1939 was 28 per cent. greater in St. Louis than in St. Louis County.

Q. Now, you are making a comparison, are you, with the

rates of St. Louis County Gas Company? A. I am comparing St. Louis County Gas Company when I say "in the
7434 county" with city rates.

The average rate per thousand cubic feet for residential gas, including house heating, for the year 1939 was $.8892, approximately 89 cents. The commercial rate was just slightly under $1. There is not a large or extensive commercial sale in St. Louis County. The industrial rate is 60 cents per thousand cubic feet. These rates apply to the 800 B. t. u. gas.

Q. Of St. Louis County Gas Company? A. Of St. Louis County Gas Company and the comparison was on a similar

gas in the city. The relations between the St. Louis County Gas Company and their customers have been very friendly and I think extremely interesting over the last many years. For example, in 1917 to '18, during the early period of the first World War, prices of all things entering into the manufacture of gas were increasing very rapidly.

The company applied for relief and was granted a 10 per cent. increase in rates by the Public Service Commission, Missouri Public Service Commission. Subsequently, a committee appointed by it was known as the League of Municipalities, being a group of the cities in St. Louis County, representatives of the various municipal authorities and including representatives of the county court, examined at the request of the gas company the company's accounts in detail and agreed that a further increase was in order. 7436

—3,148—

Now, this was being done by the customers, themselves. The League then agreed to higher rates which the company proposed and filed with the Commission, whereupon the Commission authorized the increase. This League had been very successful in its relations with the accounting interests of all kinds and was kept in operation and continued to cooperate with the officials of the St. Louis County Gas Company, with the result that for over 20 years such negotiations have been carried on and the League was presented with the facts, and as fast as possible the rates were again reduced by the same process until today they are 17½ per cent. less on an equivalent heat basis than they were before the first World War. 7437

The League each year kept informed concerning the results of the company's operation, revenues and expenses and

7438 *Stanley Stokes—By Respondents—Direct*

interest in gas property through a committee of the League, appointed for that purpose.

Q. Are the sales of gas actively promoted by the company? A. Very actively. The company has an active sales force and they do extensive advertising, even doing billboard advertising at times when conditions are right to promote the sale of house heating gas most actively.

They sell gas for cooking, water heating and refrigeration, residence refrigeration, the gas refrigerator being a
7439 very reliable and successful device.

—3,149—

In St. Louis County the water rates are rather high and the development of the air-cooled gas refrigerator was made to assist us in this phase of the promotion work. Primarily the company goes after the residential business because that is the main thing they have to deal with.

Q. Does it engage in the sale of gas appliances? A. It does. They push the sale of the appliances through their five appliance stores and also by special appliance salesmen engaged in field work. In 1939 there were 1,846 gas consuming
7440 appliances sold by the company. We have no record available as to how many such appliances may have been bought outside, but there must have been a good many. That 1,846 was divided into various different types of appliances. There were 710 ranges, 608 water heaters, 214 refrigerators, 123 space-heating devices, gas furnaces, and 47 miscellaneous domestic devices and 144 miscellaneous commercial and industrial devices.

Q. Now, state the capitalization of the company as of recent date. A. The capitalization of the company as of September 30, 1940, was $4,100,000.

Q. In what class of stock? A. That is in common stock.

Q. Now, go through the rest of the capitalization as of the same date. A. The first mortgage 5 per cent. bonds represented $1,500,000 and a surplus of $2,322,647, making a

—3,150—

total as of that date of $7,922,647.

Q. State, if you will, the provisions maintained for depreciation. A. The reserve for depreciation for the last 20 years has not been less than 12 per cent. of the depreciable property. At the present time it is higher than that. 7442

Q. What is the current rate? A. The current rate of depreciation is 17.4 per cent.

Q. Are you able to state the coverage of earnings with respect to bond interest? A. In 1939 earnings available for bond interest after provision for depreciation, amortization of debt discount and expense and miscellaneous deductions, was $527,438 or over seven times the interest requirements.

—3,151—

Q. Has the company ever defaulted on the payment of interest on any of its obligations? A. No, it has not.

Q. It has no preferred stock outstanding? A. No. it has 7443 not.

Q. Is the property of St. Louis County Gas Company operated jointly with the electric property of the Union Electric Company of Missouri in St. Louis County? A. Yes, in every possible respect the operations are carried on jointly. The officers and department heads of the gas company hold the same or similar positions with the electric company; the president, the executive vice president, the two vice presidents, the secretary, the treasurer, the comptroller hold the same or similar positions with the electric company.

7444 *Stanley Stokes—By Respondents—Direct*

Certain department heads of the electric company, such as the general store keeper and superintendent of supply service serve in the same capacities for the gas company. In the St. Louis County organization the various department heads and their operating staffs, such as auditor, engineer, sales manager, superintendent of distribution and superintendent of transportation function for both companies. Their functions are conducted jointly on most all of the operations. A little thought will illustrate the fact that a large
7445 percentage of the total operations for the electric and gas companies are identical. I can mention a list of those.

—3,152—

Q. You might illustrate the point, if you will. A Well, briefly, the applications for service, turning on and off service, meter reading, billing, credit approvals, adjustment of customer accounts, collections, sales activities, operation of branch stores, receiving customers' payments, trouble service, keeping records of connections, engineering estimates and plans for extensions, maintenance of engineering records, obtaining permits and rights of way, maintenance of
7446 automotive equipment, telephone facilities, stenographic service, mail service and many other items including purchasing, stores, accounting, real estate, handling of real estate, taxes; in other words, the two systems are operated just as though they were owned by one company. This type of joint operation saves a considerable sum of money each year as compared with what it would have cost had the gas company been operated independently from the electric company.

Q. Now, can you illustrate the savings that arise out of such joint operation and indicate their approximate extent? A. Well, to illustrate the nature of the work that provides such savings, the meter reader, when he goes from house to house to read the meter, reads the gas meter at the same time and eliminates duplicate meter readers.

In the case of a customer moving to a new address, he will make but one telephone call; one clerk has both gas and electric problems.

—3,153— 7448

The branch officers of stores are maintained at various places, and the customers can conduct all of the functions of both the gas and electric operations at the same time without additional effort, so in addition to the financial savings or economies which are made, it is really a matter of considerable convenience to the customers, themselves.

The estimated savings may be briefly stated as, sales department, due to joint operation of five sales offices, $58,000. These are estimated annual savings per year.

In the accounting department, at total of $43,500. These are due to some of the things I have mentioned, for example, 7449 the joint reading of meters was estimated to save $19,600, and so forth.

The treasury department, a saving of $9,600; the distribution department, a saving of $33,300; the engineering department, $20,700; store rooms and garages, which include a large number of items, $37,900; purchasing expense, $6,000; general office facilities due to the rental savings from joint occupancy and the savings from joint heating and combination janitor, telephone service, and so on, $21,000; the total of the items just mentioned is $230,000 a year.

7450 *Stanley Stokes—By Respondents—Direct*

Now, those estimates have been made up carefully from a number of small items and do not include any savings as a result of combined executive salaries and expenses which, undoubtedly, do exist and it is reasonable to assume that there were other minor savings that had not been listed, so that the annual saving should be and is something in excess

—3,154—

of $230,000 per year.

There are many little things that mean a good deal to
7451 the customers. I have already mentioned the conveniences in paying their bills at one location and, incidentally, either electric or gas will receive the payment. They are both billed and then they exchange the money and straighten out the account later. The customers save a considerable amount of postage by that method. It is estimated that this may amount to as much as $7,500 per year for the customers.

These combined operations with resulting economies are what make possible, to a large extent, the low rates at which the gas is sold. There isn't anything particularly different about distributing gas than there is about distributing elec-
7452 tricity. You have to use the streets, they are both delivering a service instead of a commodity, and their methods of doing business are necessarily the same.

Whenever two such businesses are operated jointly, there is naturally a saving in the combining of their functions. Moreover when the operations of two properties are combined the increased volume of work permits the use of high-salaried and more experienced personnel and then dividing the expenses.

In apportioning these expenses between companies, there is no profit or overhead expense added, and in distributing

material from the store rooms, the usual store's charge, which is calculated at cost, is made to the gas company in exactly the same manner that is made by the electric company. There

—3,155—

is no profit, in any sense of the word, added to the distribution of these joint expenses.

The chief beneficiary in the long run from such economies of joint operation is the public who gets the savings reflected in their rates and the quality of service.

Q. During your testimony you have given us a number of 7454
examples of joint operation among the various companies, including the St. Louis County Gas Company and Union Electric Company and its subsidiaries. I don't want you to repeat the instances of joint operations or inter-relationships which you have already given, but I do want you to illustrate now, if you will, other instances which occur to you with respect to all of the companies. A. Well, I shall attempt to make this comparison and the example of joint operation as briefly as I can and still go straight to the point.

Of the number of buildings throughout the system that 7455
are used jointly, as a matter of interest, you have the General Office Building of the Union Electric Company of Missouri at 12th and Locust Streets in St. Louis which houses the general business offices for Union Colliery Company, St. Louis and Belleville Railroad Company, St. Louis and Alton Railway Company and the steam-heating business in the city of St. Louis. All of the various building facilities such as water, light, heat, refrigeration and telephone are, likewise, used by all of these companies.

—3,156—

The general office building of the St. Louis County Gas Company houses the headquarters of the St. Louis County Division of the Union Electric Company of Missouri and the outlying divisions of the same company, as well as the offices of the treasury, sales, distribution, engineering and accounting departments of the St. Louis County Division of the Union Electric Company of Missouri.

The building which adjoins the general office building of the St. Louis County Gas Company in Webster Groves houses
7457 the meter shops for both the St. Louis County Division of the Union Electric Company of Missouri and the St. Louis County Gas Company.

In a like manner the general store room at 19th and Gratoit Streets and the Page Avenue store room in St. Louis County, both belonging to the Union Electric Company of Missouri, are used by it and the St. Louis County Gas Company.

Also, the store room of the St. Louis County Gas Company at Shrewsbury is used by the Union Electric Company of Missouri. Four garages in St. Louis County are used by
7458 Union Electric Company of Missouri and the St. Louis County Gas Company jointly. These, by the way, are extensive buildings and facilities. They are not just small garages. They house a large group of transportation equipment and they are permanent and rather extensive modern buildings. The chief ones are the Page Avenue garage which belongs to the Union Electric Company, the Webster Groves garage

—3,157—

that belongs to the gas company, the Moody Avenue garage of Webster Groves, which is rented, and the Shrewsbury garage which belongs to the gas company.

There are four branch offices in St. Louis County jointly operated by the Union Electric Company of Missouri and the St. Louis County Gas Company. Those are located in Wellston, University City, Maplewood and Luxemburg. In addition both companies, as previously stated, maintain their general business offices in the gas company's building at Webster Groves.

At Keokuk, Iowa, the common office, common garage and store room are used by both the Iowa Union Electric Company and the gas business at Keokuk, which is also conducted 7460
there.

At Alton, Illinois the Union Electric Company of Illinois there have their facilities in common with the gas company which they operate.

The Lakeside Light and Power Company at Lakeside, Missouri and the Union Electric Land and Development Company have common offices and store rooms at Lakeside and are under common management.

I have previously mentioned the economy of combination use of the Ashley Street Power House and steam-generating facilities which are used both for the steam service as well as 7461
for power developed. The transportation equipment of the Union Electric Company of Missouri also handles all the work of the steam department. The Union Electric Company of Missouri does delivery work and delivers appliances to cus-

tomers and handles material between store rooms and takes care of the requirements of these various divisions, including the St. Louis County Gas Company, in the same manner that it handles its own work.

7462 The same facilities and equipment are used in salvaging material removed from the properties of the various companies as are used by Union Electric Company of Missouri, that is, the same facilities which they use for their own salvage operations are used for the other companies.

Union Electric of Illinois, St. Louis County Gas Company, Union Colliery Company, St. Louis and Belleville Electric Railway Company, their passenger cars, trucks, trailers, and so forth, are all used each for the other as well 7463 as for themselves. For example, when a fire occurred in a cable duct in downtown St. Louis a year or so ago, all of the air compressor equipment, a number of trucks and passenger cars of the gas company were immediately sent to St. Louis and were of considerable aid in restoring conditions to normal.

In St. Louis County all billing machines, mailing machines, addressing equipment and other office machinery, furniture and equipment are used jointly by the Union Electric Company of Missouri and the St. Louis County Gas Company. Likewise, at Alton, Illinois and Keokuk, Iowa 7464 joint use is made of the general office equipment and similarly at Lakeside the Union Electric Land and Development Company and the Lakeside Light and Power

Company make joint use of such equipment.

The Union Electric Company of Missouri maintains an automobile mail delivery service which connects its main office with the various branch offices, store rooms, sub-stations and so on. This same mail delivery service is extended to the St. Louis County Gas Company and the Union Electric

Company of Illinois, which avoids a considerable amount of duplication and an unnecessary expense.

The Union Electric Company of Missouri maintains a photostat and printing equipment which is made available to all the subsidiary and associated companies, which allows them to get such service at lower cost than they would have if they had to provide it for themselves.

The Steam-heating Division and the St. Louis County Gas Company have frequent occasion to make excavations for working on the mains or installing new mains and the equip- 7466
ment of the underground crews of the Union Electric Company of Missouri is used for that as well.

—3,160—

Q. I think you have already indicated that certain executive officers acted in common for the various companies. Will you be a little more specific in amplifying that comment? A. Dr. William McClellan, Mr. E. T. Gushee, and Mr. John A. Woodbridge, president, executive vice president, and vice president, respectively, of Union Electric Company of Missouri, hold the same position in the various subsidiaries and affiliated or associated companies, and direct the busi- 7467
ness of all of this group of companies.

The smaller companies in the group consequently benefit from having available the same executive direction as the main company, the Union Electric Company of Missouri.

There are other officers of the Union Electric Company of Missouri who hold similar position, or carry out similar functions for the other companies. I can mention a few of these.

Mr. F. J. Meistrell, secretary; Mr. John L. Ganz, treasurer; Mr. A. H. Schlettler, comptroller—serve in the same

capacity for virtually all of the group of companies, that is they have that position in the Union Electric Company of Missouri, and they have that or an equivalent position in each of the other companies.

Centralization of the functions of these corporate officers provides a greater uniformity of methods and practices, and the smaller companies and businesses benefit therefrom.

—3,161—

7469 Q. Are accounting procedures in the various companies directed by the Union Electric Company of Missouri? A. Yes, the Union Electric Company of Missouri has the major accounting personnel, and they direct the accounting policies for the other companies, and make special accounting studies necessary for obtaining adequate accounting control, and they assist in setting up accounting methods so as to have available information needed for the various regulatory authorities, which information is continually required.

They obtain uniformity by such centralization, and they do most of that work under the general direction of the general auditor of the Union Electric Company of Missouri.

7470 It is necessary to have available adequate records of the property of the various companies, and to keep the records up to date as to property additions and removals for not only the Union Electric Company of Missouri, but for all of the subsidiaries and related companies.

That work is all under the direction of the valuation auditor. That provides for uniform methods and gives the benefits to the smaller companies of a high grade personnel.

In the preparation of financial reports, reports to regulatory authorities, and the maintenance of the records of a

statistical nature, this work is done for all the companies under the direction of the fiscal and statistical auditor of Union Electric Company of Missouri. To provide adequate

—3,162—

information for the management so as to maintain the proper control of the finances of the company, budgeting of construction expenditures, the accounts affecting income and the cash requirements of all the companies are handled by the budget auditor of the Union Electric Company of Missouri. 7472

General supervision of accounting procedures and methods for the various companies is centralized in the operating auditor of the Union Electric Company of Missouri.

Income tax and related tax matters of all subsidiaries and associated companies are handled by the tax supervisor of the Union Electric Company of Missouri.

Q. I think you have already mentioned, have you not, the centralized purchasing agency which acts for all of the companies? A. Yes, that has been described in some detail.

Q. And also the centralized stores procedure which similarly acts for all the companies? A. That has also been described. 7473

Q. Is the engineering personnel of the various companies available to each company in the group? A. It is, and I think that is of considerable importance because it would not be practicable for these smaller companies to maintain an extensive engineering organization with high class personnel which would be too expensive to maintain for such

—3,163—

small companies, as many of these are.

7474 The way the matter is actually handled is that the mechanical engineers in the electric business—for example in the Union Electric Company of Missouri, the men who are responsible for not only the mechanical construction, but the mechanical operation—those engineers, with their knowledge of steam production and utilization, are used by the steam heating business for its engineering problems, and in giving engineering advice to its customers; and the electrical engineers of the Union Electric Company of Missouri, en-
7475 gaged in the electric business, are in a position to give engineering advice to the electric railway, coal mining, steam heating and gas businesses.

For example, my department just recently completed the design and pursued to its completion the construction, of a 3,000 kilowatt portable railway sub-station.

We also made a number of layouts and studies for the safety operation of the underground electric haulage in the mine.

Within a year, or such matter, we specified and supervised the purchase of a motor generator set for the mine. At
7476 that time the mine had been given to understand that the thing they should put in was a mercury arc rectifier. A little engineering and economic study of the problem showed that that was not suitable for their purpose.

—3,164—

So that I could make a long list of examples to show the use of the various engineering facilities in and by the different companies.

The St. Louis County Gas Company has to have high grade engineers who are skilled and experienced in the pro-

duction and distribution of gas, and the services of those men are available to the gas business at Alton and at Keokuk, the first being under the direction of the Union Electric Company of Illinois, and the second under the direction of the Iowa Union Electric Company.

We recently completed the design, including detailed drawings for a sub-station of the Iowa Union Electric Company at Ft. Madison, where they were putting in frequency changers and completely changing the distribution system to convert the town from 25 cycles to 60 cycle service. 7478

Q. When you say "we" who do you mean? A. My own immediate department.

Q. In the Union Electric Company of Missouri? A. Which functions for the Union Electric Company of Missouri.

In such operations we keep an accurate check of the hours worked on that project, and all the men that report to me distribute their time exactly as worked. My time is not distributed in exactly that manner, but on a fixed and equitable basis, adjusted each year based on the amount of 7479

—3,165—

business done for the different companies. No profits of any kind, or overheads, are added.

Q. Are property tax matters for various companies centralized in one department? A. Yes, the property tax matter has been previously mentioned, but I could explain that the returns of property for taxation, appearances before tax authorities, studies of tax equalization, and related tax matters for all of the companies, are centralized in a real estate

and tax department of the Union Electric Company of Missouri.

—3,166—

Q. Are real estate transactions similarly centralized in one department? A. They are, the real estate department of the Union Electric Company of Missouri.

They advise and take care of the real estate problems for the other companies.

7481 We just recently had quite a little series of problems at the new Venice plant site where certain easements ran through the site, and were set apart for the levee board, giving them a right to maintain levees in certain locations; in addition to which, there were some early street easements, and a further complication by reason of the fact that at one time boats used to land at a regular landing at that point, and the people going to and from the boats had crossed the property for some years. It was necessary to clear up all of these matters before the plant building could be located and work started.

7482 The real estate department was of particular help to the Union Electric Company of Illinois in that work.

Q. Does the research department of the Union Electric Company of Missouri perform services for, and is it available to, the other various companies? A. It does. The research department of the Union Electric Company of Missouri is essentially an economic research department. I mean economic as distinguished from a research department which would be working with laboratory equipment.

—3,167—

They make business studies and investigate personnel problems, analyze any means of improving economies or bettering the operating method.

That department is available to all companies, and functions primarily for the larger company, the Union Electric Company of Missouri, but is called in for various types of studies, and charges, of course, only the cost of the work.

Q. How about the Director of Industrial Relations of Union Electric Company of Missouri? A. We have mentioned him previously several times in a little different connection, but he functions for all of the different groups of companies and maintains an employment office in the general office building at St. Louis, and carries on employment activities for the Union Electric Company of Missouri, the Union Electric Company of Illinois, and the St. Louis County Gas Company. 7484

He does not maintain employment offices at the other places because they are very small, but he carries on the operation.

The centralization of these various functions performed by the Director of Industrial Relations naturally results in a more accurate compliance with employment laws, a greater uniformity of personnel policies, and a lower cost of performing these various functions—all of which primarily benefit the smaller companies in the group. 7485

Q. Is there a chief hydraulic engineer for the Union Electric Company of Missouri, and if so, does he perform

services for any of the other companies? A. Yes, Mr. Davis has previously been mentioned. He is the chief hydraulic

engineer. He was mentioned in other connections such as the development he made on governors and so on.

He does function for the Mississippi River Power Company and for the Union Electric Company of Missouri, handling the hydraulic operation for both the Bagnall Dam and the Keokuk power plant.

Without that joint operation it would be necessary to have two men of a caliber equal to that of Mr. Davis, because either operation requires the same skill, experience and
7487 ability. With that one man handling the whole hydraulic work for both companies, he is in better touch with the situation at all times.

Mr. Hamilton: I believe that is all at this time, Mr. Examiner, from this witness.

If I understand correctly the cross-examination of Mr. Stokes is scheduled for tomorrow.

(Off the record discussion.)

Mr. Odell: Mr. Examiner, I would like to have this hearing continued until two o'clock tomorrow afternoon, at which time I hope to be prepared to cross-
7488 examine Mr. Stokes.

The Examiner: All right, we will continue the matter until two o'clock tomorrow.

(Whereupon, at 3.20 p.m. the hearing was recessed until 2 p.m. of the following day, Thursday, October 31, 1940.)

7489

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

7490

Hearing Room 1102-A,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Thursday, October 31, 1940.

Met, pursuant to adjournment, at 2 o'clock p.m.

7491

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD and HERMAN ODELL, Attorneys for the Securities and Exchange Commission.

—3,170—

7492 *Colloquy*

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Odell: Mr. Examiner, at this time I am not prepared to cross-examine Mr. Stokes.

I find that in view of his lengthy testimony, and the technical nature of the testimony, that I need more time to prepare my cross-examination.

I therefore will not be prepared to cross-examine him this
7493 afternoon, and will not be prepared to cross-examine him tomorrow morning. I will be prepared to cross-examine him any time after Saturday of this week.

Mr. Browning: We are both surprised and disappointed with the statement by Commission counsel in view of the previous discussion and the clear understanding that cross-examination of Mr. Stokes would take place today.

We are really inconvenienced, and I will not insist upon our strict rights only because I am unwilling to put the Commission's staff in a position which they insist will be disadvantageous to them.

7494 I must say for the record, however, that in view of the position which we are taking today, that we will hereafter expect a similar attitude on their part.

Under the circumstances, it would seem that the only practical step to take would be to adjourn until Thursday, November 7, at which time we will be prepared to put another St. Louis witness on the stand.

—3,171—

It is my understanding that Commission counsel will endeavor at that time to give us their views as to whether

7495

they will desire to cross-examine Mr. Stokes, so that if so, he can then be recalled for the next session.

The Examiner: Very well, this matter is now continued until Thursday, November 7, at 10 a.m.

Mr. Odell: I want to add this. I don't think it is unreasonable to ask to have two or three days to prepare to cross-examine a witness like Mr. Stokes, whose testimony was quite voluminous and quite technical in nature.

7496

I think that we have always cooperated with Mr. Browning in all of his requests for continuances, and we have always acceded to his requests for additional time to prepare his next witness for direct examination.

Mr. Browning: In that connection, Mr. Examiner, our only objection whatever to the delay has been because of the necessity of Mr. Stokes returning to St. Louis for his own business reasons. We would be only too glad to give any amount of time for cross-examination of any witness, if the business aspects permitted.

7497

Mr. Odell: I fully appreciate Mr. Stokes' position here, and I don't want to inconvenience him in any way. I have tried as hard as I could to accommodate Mr. Browning and Mr. Stokes, and have attempted to be prepared to cross-

—3,172—

examine him this afternoon, but I find that that is impossible.

The Examiner: All right, we will continue the hearing until the time I have indicated.

(Whereupon, at 2:05 o'clock p.m., the hearing was continued until 10 o'clock a.m., Thursday, November 7, 1940.)

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

7499 THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1101,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Thursday, November 7, 1940.

Met, pursuant to adjournment, at 10:10 o'clock a. m.

7500

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan and Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, Attorney for the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Hamilton: Mr. Michel!

Whereupon, CHARLES E. MICHEL, called as a witness on behalf of the Respondents, being first duly sworn, was examined and testified as follows:

Direct Examination by Mr. Hamilton:

7502

Q. Will you give the reporter your name and address? A. Charles E. Michel, 5720 Julian Avenue, St. Louis, Missouri.

Q. Please state your present connection with Union Electric Company of Missouri? A. I am vice president in charge of sales.

Q. And explain, if you will, the duties and functions which you perform? A. As vice president in charge of sales, it is my duty to formulate the sales promotional plans, to organize and control the sales department, to put into effect the promotional plans that are designed by the men under 7503
my direction, and to handle the service to the customers, including dealings directly with the customers in connection with the securing of contracts, and clearing up any of the difficulties that may arise between the company and the customers.

—3,175—

Q. Those services extend to the entire Union Electric Group, do they not? A. Yes, sir; they do.

Q. Will you describe briefly your career with the Union Electric Company of Missouri? A. I entered the service of

the company in 1907 as manager of the electric automobile department; in 1913 I was appointed manager of the appliance department; in 1916 I was appointed manager of office sales; in 1918, acting sales manager; in 1919, sales manager —at which time I was also assigned to organize and develop the merchandising business for the Milwaukee Electric Railway & Light Company. I continued in the dual capacity until 1924, at which time I gave up the Milwaukee work; and in 1935 was elected vice president in charge of sales.

7505 Q. Now if you will, please state your education? A. The early part of my education was in the private schools in St. Louis where I was born. Then, from the 8th grade into the high schools, I attended the public schools of St. Louis. Then I took special courses in mathematics and chemistry, and afterwards entered the Virginia Military Institute at Lexington, Virginia, and graduated from that in the engineering course.

Q. You were born in St. Louis, were you not? A. Yes,

—3,176—

sir; I was.

7506 Q. And you have lived there practically all your life? A. Yes.

Q. During the course of your services with the Union Electric Group, have you received any award of any character? A. Yes, sir; I have. In 1933, I received the James H. McGraw Award for Cooperation. Do you care to have me give the citation of that award?

Q. Give it in substance, very briefly. A. Very briefly, it is:

"In recognition of constructive contribution to the advancement of the cooperation of the electrical industry

through your creative leadership in coordinating the development of the electrical market in St. Louis and inspiring the electrical men of his State to united action in the promotion and defense of their industry."

Then in 1932, as chairman of the St. Louis Electrical Refrigeration Bureau, we won the highest award for national bureaus throughout the United States. At that time they assigned a quota to each of the bureaus throughout the country, and the St. Louis bureau doubled its quota, which was the largest doubling of any utility bureau in the country, 7508 and when I say "utility bureau", that means that it was made up not only of the utility men, but of all the dealers handling electrical refrigeration.

—3,177—

Q. Is the McGraw Award, of which you have spoken, sponsored by the Electrical World? A. By Mr. McGraw, the publisher of the Electrical World, yes, sir.

Q. Now will you state in general the policies of the sales department of the Union Electric Group? A. The general policies of the group are the securing of a constantly expanding use of service by existing customers, and the pro- 7509 moting of such growth in the number of customers as the territorial conditions permit, and the protection of existing loads.

The general policies are that expanding use of Union Electric Group's service by existing customers must come largely through the purchase by such customers of additional utilization equipment; that there are hundreds of commercial institutions which can be induced to offer electrical merchandise for sale to the customers of the Group; that the

7510 greatest volume of sales of electrical merchandise can only be achieved by giving maximum stimulation and cooperation to such commercial establishments; that one of the essentials in a cooperative program is aggressive leadership along sound, ethical sales and merchandising lines, which give full freedom to cooperating agencies to conduct their business in the manner they decide upon without interference from us; that every legitimate manufacturer, dealer, product and branch of the cooperating industry be permitted

7511 —3,178—

to participate in business created by the Group's promotional program, on the same terms as all competitors, and that the correlated business, not directly interested in the sale of electrical merchandise, can, under proper stimulation, be helpful toward the success of such an operation.

Q. Before getting into any extensive description of the various programs pursued, I think you might state, if you will, the general nature of the sales department from an organizational standpoint, that is, where authority is con-

7512 centrated and where functions are performed separately from a central headquarters? A. The sales department of the Union Electric Group is made up of men located at headquarters in St. Louis, as well as at the other offices maintained by the Group throughout the system.

In the City of St. Louis there are 219 such employees; in St. Louis County there are 51; in the outlying Missouri properties there are 32; in the Lakeside property there are 2; in the Illinois properties there are 21; and in the Iowa properties there are 10—or a total of 335 men and women.

Operated in conjunction with these forces are 26 stores. These stores render all classes of utility service to the customers in the districts in which they are located.

Q. Now is this headquarters staff divided up into a num

—3,179—

ber of divisions? A. Yes, sir. The headquarters staff must be prepared to serve all the divisions of the Group. There being comparatively few customers in the outlying districts, those districts cannot afford to have on their staff, and located right in those districts, the rather expensive type 7514
of man that is necessary to handle the many different types of electrical development and sales that present themselves.

There are 5 divisions in the headquarters staff:

Utility sales work, which constitutes the sales to our commercial, residential and industrial customers.

The merchandising sales force, which handles the sale of electrical merchandise to the residential group.

The dealer sales group, which handles the cooperation between the company and the extensive dealer organization that is cooperating with the company throughout its district in the prosecution particularly of merchandising sales. 7515

The rural group, which has charge of the development of our rural territory.

The advertising group, which has charge of the advertising for all of the districts, in cooperation with each of the groups that I have mentioned before.

Q. Now, if you will, state what the Sales Department does with respect to promotion of residential service? A. In carrying out the policies that we have in connection with

—3,180—

the development of the residential business, in cooperation with the electrical dealers throughout the district, the Union Electric provides a sound leadership by conducting aggressive merchandising operations in its own stores.

Now the value of that operation is many-fold, not only to the company, but to the customers and to the cooperating dealers alike, in that it provides throughout the system model displays for the benefit of the public and the dealer, and these are located in our own show rooms, but many of
7517 them are made available to the dealers.

It permits the introduction and the promotion of new merchandise for which a market has not as yet been created, and which profit-minded dealers would be unwilling to promote.

I might give an example of that in the electric range. Up to a period of about 5 years ago, all electric ranges sold in our district were sold by the Utility Company, and the sales were very small, running about 250 ranges a year. At that time we decided to promote the range through the dealer as well, set up sales programs and the advertis-
7518 ing programs so that this dealer could cooperate to his advantage.

The sale of ranges has jumped by leaps and bounds, and today, after just those short few years, the dealers are selling 60 per cent. of all of the ranges sold in the district.

The residential promotion also permits the formulation

of campaigns of various kinds, and assures their success by aggressive selling methods. By that I mean that our experience in the operation of the stores, in selling ourselves, gives

us the necessary background in order to accomplish these facts:

It permits the constant stimulation of the market through advertising, and other publicity.

It sets standards of fair advertising policies.

The elimination of excessive trade-in allowances, and the maintenance of sound financing plans. It does that by example only.

It stimulates the formation of manufacturers' and distributors' sales campaigns for dealers on a system-wide basis, 7520
without which the sales would not be comparable to what they are today.

It gives us valuable first-hand information on the problems of the cooperating dealers, and provides a proving ground within our own control, of the effectiveness of our various promotional plans.

It gives us, as a promoter—and that is what we are in connection with the sale of this merchandise—the necessary first-hand information on public preference and acceptance, and through the negative reactions of the public to certain 7521
policies and merchandise, divulges impediments to the substantial sales so necessary as a guide in formulating promo-

—3,182—

tion plans for the dealers.

Q. Please state what the sales department does with respect to commercial and industrial promotion? A. In the commercial and industrial fields, load-building promotional operations are also constantly under way. In these fields the Union Electric Group sells no merchandise. It directs its efforts exclusively to the development of the market and

7522 *Charles E. Michel—By Respondents—Direct*

the promotion of the merchandise that is offered for sale by selling agents appointed directly by the manufacturers or by the jobbers.

The promotional plans in these fields are scheduled with respect to customer groups as well as cooperating agencies.

Now in the promotion of that sort of merchandise, it is not possible to use the same methods, the same shot-gun methods that are used in the promotion of merchandise to the residential customer. You have to be selective as to the

7523 group of customers that you reach, as well as the group of dealers that you reach in the promotion of each of the different pieces of merchandise.

As an example, the customer that is interested in, for instance, some commercial cooking device, and the jobber and the manufacturer that is interested in that particular device, are totally different from the customer who may be interested in some large electric furnace.

The consequence is that each one of the men that is de-

—3,183—

7524 tailed in this work must have their groups of customers so drawn up that they may be reached by direct mail or otherwise, and by solicitation from the cooperating dealer group, without a lot of lost time in calling on customers not interested in the particular devices that are under promotion.

The promotion in these deals is active and aggressive, it employs advertising in all of its forms, although not usually newspaper advertising; dealer education; group demonstration and display meetings; demonstration installations; and the like.

Q. You have spoken of the extent of the sales department and of the number of divisions within it. Are the persons in charge of those divisions for the most part college graduates? A. The people in charge of the different divisions that I have spoken of are charged with the responsibility of advising the public in the economical use of electric service. I have always felt that those men and women charged with that responsibility must be very capable. In the group that I have mentioned, we have 40 men and women who have college degrees. 7526

I might give an example. The man in charge of our industrial heating division, which has to do with the sale of electric furnaces and all kinds of heating apparatus, is a B.S. in Electrical Engineering, and Ph. D in Physics and

—3,184—

Chemistry.

One more example. The two men that are in direct charge of the development of our rural service division, and rural customers, hold a B.S. in Agriculture.

Q. Now state, if you will, what the industrial sales division does, and what its functions are? A. The industrial sales division is a combined sales and service organization responsible for all negotiations with the larger industrial and commercial customers of the company. 7527

They handle all of the negotiations with customers having a connected load of 25 kilowatts and up. Of course, their prime purpose is the building of the load. They also, in connection with that work, are expected to build the good will and coordinate the customer-company relations. They are supposed to make their services so valuable to the cus-

7528 *Charles E. Michel—By Respondents—Direct*

tomer that when problems arise the customer will consult the company.

The activities of the division are to conduct all negotiations with customers of 25 kilowatts connected load and above, handle the execution and cancellation of their contracts for both new business, for successor orders, for change of rates when indicated that such change is to the advantage of the customer; and to make regular and frequent calls.

They have another very important job, and that is the

7529 —3,185—

contact with consulting engineers, architects, builders, contractors, and others, with reference to the new construction and changes in customers' conditions.

Very frequently it is necessary that those men guide the plans of an organization in the early stages of its development. Otherwise, they will provide service for the wrong type of the electric service that is available in the district, and will not take advantage, possibly, of the proper meter combinations to produce the lowest rate for the customer.

7530 That is one of the important duties of those men.

After the arrangement has been made through these consulting engineers and the customer, their job is to expedite the service connections, and they also have the important duty of handling the complaints and settling misunderstandings with these customers.

They again have a most important function, and that is to assist the customer to utilize electric service to his best possible advantage. That may have to do with actual changes in the plant layout, the type of drive, the type and

 7531

size of motors, the method of running the load of the customer, and so forth.

An example, briefly, I might give at this point is one that we had with a large baking company. Their demand was rather large, demand for electric service, and their bill was correspondingly high.

—3,186—

One of the industrial engineers found, upon surveying the plant, that that customer was charging his electric trucks at hours at which it was not necessary that he do so. In 7532
other words, he was putting the charging load on top of his ordinary manufacturing load, and thereby doubling his demand, which carries, under demand schedules, a higher charge.

By working with the engineer he was able to have that man schedule the charging of his electric automobiles in what we would normally call the off-peak hours in so far as his business was concerned. In other words, he would come on —if the business closed down at 5—he would throw his trucks on after 5 o'clock and run them before the business started in the morning. This particular business had a type 7533
of load that scattered throughout the 24 hours of the day, and it was very necessary that charts of operation be prepared.

After the completion of the study, and working with the man in charge of that work, the customer cut his bill with us very sharply. He has since told us that in his plants, located throughout the United States, he has had similar studies made and in his electric services he is now saving $50,000 a year due to that operation.

7534 *Charles E. Michel—By Respondents—Direct*

These engineers also have the important duty of bringing new developments and improved ideas and methods to each of the manufacturing groups with which they deal.

The general power sales group consists of five experienced industrial sales engineers for the city and county of

—3,187—

St. Louis, one for the outlying Missouri territories, one for the Illinois territories, and sales engineering assistance, whenever desirable, in any and all locations of the company
7535 from the Keokuk district down through the rural districts of Missouri.

Q. Now, if you will, state what the commercial sales division does, and what its functions are? A. The commercial sales division is a combined sales and service organization, which conducts the business of sales, service and promotional load-building with commercial customers of the Union Electric Group.

The organization in the City of St. Louis consists of 21 capable and experienced salesmen. Each has from one thousand to two thousand customers to look after.

7536 In St. Louis County, it consists of two trained load promotional salesmen.

In outlying Missouri, Illinois and Iowa, the work corresponding to that performed by the commercial salesmen is under the direction of the district manager in these different districts. This manager has, under his control, a branch manager and an office manager, commercial and industrial representatives, a new business manager in certain cases, and they conduct that business with the direct help of the St. Louis organization in that, wherever there is a job

that comes up that requires attention, which they are not capable or feel that they are not capable of giving, the St.

—3,188—

Louis group go into the territory and do the work.

The functions and activities of the division are much along the same lines as those I have described for the industrial sales force, with the very sharp distinction that they are handling the small commercial customer. The majority of their work is with customers that have loads up to a maximum of 25 kilowatts, but I would say on an average of 7538
5 or 6 kilowatts, and consequently they are people who do not have in their employ, as a rule, capable engineers to advise them, and do not employ consulting engineers as a general thing. So that these men must function for that customer in those particular lines.

Their duties are to follow up the calls; the building permits; newspaper real estate notices or items on new or expanded business; to conduct sales negotiations with third parties involving the customers.

I have explained the general methods.

Assemble information for the orderly extension of the 7539
transmission facilities.

Study the rate applications in securing contracts.

Promoting load—and this work consumes a sizable portion of their time.

They are expected to promote the lighting, commercial cooking, air-conditioning, and electric heating in the stores

—3,189—

of their customers when, in their judgment, it can be done to the advantage of the customer. Their method of work

there is to develop the prospect to a point where a specialist is necessary to give final and conclusive evidence as to the presentation that has been made, and actually close the order for the work when the specialists are called in from the sales department.

They also attend meetings and school demonstrations and displays, particularly in lighting work; follow-up or good will calls on customers; conduct interviews to uncover or develop information where customers are considering
7541 power other than utility service; conduct business with chain stores and chain service organizations.

This is a specialized group. We find that the chain stores usually have, in their employ, engineers and others who are highly specialized in their different branches. Our salesmen must be fully capable of meeting those men on their own ground, and discussing their problems in the use of electric service with them, and as a result we have found it necessary to develop two men who handle the chain stores exclusively.

These salesmen also assist the customer in locating and
7542 avoiding waste. They handle lighting surveys, they check meter tests on equipment suspected of wasting electric energy; and other forms of service to avoid waste.

—3,190—

Q. How is the residential service division organized, and what does it do? A. Well, the division handles service and load-building negotiations with our residential customers. There are 10 lighting women advisers who make verbal recommendations for correct lighting, and in conjunction with two salesmen, make calls on the customers in the city.

7543

Q. This is the City of St. Louis? A. Yes. There are two home-lighting women advisers who devote their entire time to home-lighting in St. Louis County and the outlying districts of the group.

There are two salesmen, whose duty it is to apply proper rates and handle other calls requiring personal contact with the customers, including line extensions, the temporary service connections for builders, new permanent business, and so forth.

A development engineer calls on architects and builders 7544
and cooperates with them on the adequate wiring, lighting, kitchen planning, and the general use of miscellaneous electrical appliances.

One woman lecturer devotes her entire time to lecturing on the subject of "better light, better sight" before any type of group desiring her services.

The division recommends various uses of lighting and appliances, and leaves the selection of the dealer to the

—3,191—

customer.

Inquiries about wiring are answered by giving the cus- 7545
tomer helpful advice on the subject, and then referring them to a licensed contractor of their own selection.

The operation of the division is based on the requirements, and calls are routed as to their location, except where urgency requires immediate attention.

The home-lighting advisers are assigned to districts throughout the city and the county, and calls are made following the regular meter routes. The adviser carries sufficient equipment to measure and demonstrate lighting of all

rooms and completes her call with a written recommendation. All requests or complaints of the customer are reported and followed to a satisfactory conclusion, many of which result in customer good will.

The lighting advisers are also available to dealers for store demonstrations, exhibits and personnel training.

For competitive and routine calls by the two salesmen, the city is divided into two parts. Each salesman handles all routine calls in his district, follows all calls to completion,
7547 seeking to develop closer relationship with the customer in the conduct of the business of the company.

All calls in relation to the district are given to the salesmen daily. Telephone orders for new connections are received and routed by the clerical division.

—3,192—

The development engineer calls on architects, builders, homeowners, urging more use of electrical equipment and wiring where it is indicated. This same engineer advises the consulting engineers and the customers as to the services available from the Adequate Wiring Bureau of St. Louis, an
7548 organization which will check and suggest the proper layout of wiring for any class of home or store.

Now the residential service division has efficiently handled customer requests, educational promotions, and routine calls, which produce better living electrically for the customer, and improve customer relations and revenue for the Union Electric.

The home-lighting advisers in St. Louis and in St. Louis County, between October, 1934, and December, 1938, made 22,975 written recommendations for better home lighting.

7549

In the cities of St. Charles and Washington, located in the outlying districts of Missouri, approximately 3,000 demonstrations were made since June, 1938. Two salesmen make an average of 5,000 calls per year, consisting of calls about customers' relations, explanations, and advice on problems relating to rates, bills, availability of service, wiring, and so forth.

Lectures and demonstrations in the rural territory were made by the lighting advisers in cooperation with the rural service division.

7550

—3,193—

Various other lectures, meetings and demonstrations with doctors, nurses, blind societies, dealers, and trade organizations, were conducted by the supervisor for the training and the education in relationship to light and vision.

Q. What does the merchandising division of the Group do? A. The merchandising division of the Union Electric Group is responsible for the sale of all electrical merchandise sold by the company to its residential customers and performs certain load-building and service transactions for small commercial and residential customers.

7551

It is charged with the offering of leadership in cooperation with the dealer sales counselor, to all interests of the local electrical industry engaged in selling electrical merchandise to the residential customers.

It is also charged with the development, test and formulation of plans for the expanding use of service by the residential customers through increased use of appliances in the home.

7552 *Charles E. Michel—By Respondents—Direct*

It supervises the operations of all of the stores handling all types of customer transactions for residential and small commercial establishments.

It sells incandescent lamps or renews incandescent lamps for residential customers. More than 150 are employed in the merchandising division of the Union Electric Group.

—3,194—

The Group has been eminently successful in selling electrical merchandise to the residential customers. During the
7553 year 1939, they sold approximately $1,000,000 in electrical merchandise to the customers of the Union Electric Group, and this represents approximately 7 per cent. of the total domestic electric appliance business done in our territory.

Nearly 13,000 electric refrigerators were sold by the merchandising division during the period 1930 to 1939, inclusive. This is approximately 5 per cent. of the refrigerators sold to the residential customers.

Nearly 7,000 electric ranges have been sold to the residential customers during the period from 1935 to 1939, and
7554 this is more than 30 per cent. of the ranges sold during this period.

It is estimated that the Union Electric residential customers purchase during an average year more than 80,000 small electrical appliances from the merchandising division. It is estimated that nearly 30,000 I. E. S. or I. E. S. type of lamps, have been sold during the period 1934 to 1939. I might explain that "I. E. S." means Illuminating Engineering Society, who have approved certain types of incandescent lamps and fixtures for the proper use in seeing, and these lamps usually use bulbs of from 100 to 300 watts capacity.

They bear the label of the I. E. S., and in all cases where they do bear that label, they have been passed through a laboratory to see that they do conform with the specifications of those lamps.

—3,195—

The personnel of the stores, of which there are 26 in the Group, sold and renewed nearly 2,000,000 incandescent lamps during the period of 1939. They handled more than 75,000 applications and disconnections, that is, applications for service, and disconnections from service. 7556

They handled many thousands of customer complaints, appliances repairs, and other adjustments, and they sold in these stores approximately $800,000 worth of the $1,000,000 worth of appliance business done by the Group.

Now, continuous training of all employes of the merchandising division is performed by the supervisor. The supervisor is instructed by the merchandising manager and assistants, in cooperation with other divisional managers. In other words, his job is to train the merchandising men in all stores in all places throughout the Group.

The Union Electric Group, through its direct merchandising operations, and in cooperation with the electrical industry, publicizes or otherwise brings to the attention of thousands of its customers annually, the opportunities for use of electrical merchandise in the home. 7557

The direct merchandising operations, it is endeavoring to make all of its promotional efforts timely, taking advantage of seasonal opportunities for business.

In all of its direct merchandising activity, it ties in

—3,196—

7558 *Charles E. Michel—By Respondents—Direct*

the distributor and the dealer to all promotions conducted by the company's merchandising division. The company will not knowingly enter into any promotion by its merchandising division, in which the distributor or the dealer cannot actively participate.

During the 10-year period from 1930 to 1939, the merchandising division has run more than 6,000 advertisements amounting to more than 2,600,000 lines of advertising, and during this period of time nearly 1,500,000 pieces of literature have been distributed to the customers.

7559

A coordinated operation of the Union Electric Group's merchandising division affords certain economies and uniformities of operation that could not be achieved otherwise. The merchandising manager and his assistant plan and develop all of the merchandising programs conducted by the company's merchandising division.

The company's own participation in appliance merchandising facilitates effective dealer cooperation through a realistic understanding of the dealer's problems.

7560

The coordinated method of operation of the Union Electric System brings to the rural residential customer the same selection of merchandise, the same terms of payment, and the same standards of quality, and the same excellence of service, that are afforded the larger urban centers.

Without the coordination of effort, and integration of

operation, the rural residential customer would be deprived of some of these benefits.

The merchandising division avails itself directly of the services of the home service division of the company, which

7561

is made up of the home economists, whose duty it is to educate the public in the use of electrical devices in the home. It is not a selling organization and has no connection whatso ever with sales, and is purely an educational organization.

Demonstrations of electrical appliances are conducted in the company's home service kitchen, in branch stores, in neighborhood theaters, and in meetings of women's organizations, clubs, schools, home shows, county fairs and other appropriate places.

7562

Menus are prepared and tested for distribution to the company's customers. Customers are assisted by the home service division in the modernization of their kitchens and their laundries, and in the selection of other appliances necessary to complete these units.

One of their important duties is the testing of new merchandise submitted by the manufacturers.

It has saved us from making some very serious mistakes in our general promotion plans.

I may mention one example there, just to show what that was.

7563

A manufacturer submitted a small portable oven that had

a great deal of customer appeal. Of that I was personally sure. I felt confident that it could be sold in very large quantities, providing always that the merchandise itself was right.

I placed an order with that manufacturer for a substantial number with the proviso that the merchandise be submitted by sample, and the order was to stand if it passed the home service division.

7564 On test, this small portable oven could not pass our home service women. The distribution of heat within the oven was totally wrong, and the product coming out of the oven was not uniformly cooked and browned. The matter was fought through for a long time, and that particular manufacturer discontinued that model. Others have been made since that, which do a satisfactory job along the lines of cooking, but I attribute much of the final excellence of the article to the determined position taken by our home service depart-
7565 ment in refusing to let the item go across for sale through our sales department.

Now, I might mention another item in there, which shows something of what the department is doing in connection with some of the larger load building items.

We have at the present time some 25,834 electric ranges on our lines. That represents a saturation for the Union Electric Group of approximately 8.3 per cent. We have sur-

—3,199—

veyed these ranges carefully by putting meters on 651 of them, and taking readings over a sufficient length of time to
7566 determine the average consumption. We find that the average consumption per electric range is 95.8 kilowatt hours per month.

We also find that the cost per kilowatt hour for cooking in the district averages 2.23 cents per kilowatt hour.

In the case of the electric refrigerator, the total installations made in our territory are 292,191. That gives us a saturation percentage of approximately 87 per cent. The figure is made up of our known sales plus the sales that are reported to us as made in our district by distributors. Once

every six months every distributor doing business in the territory gives us a figure on what his sales to dealers in our territory were, and that is taken as the figure that they have sold.

The average use per electric refrigerator as of today I estimate as 30 kilowatt hours per month, and under the second step of our residential rate, of 2½ cents per k. w. h., that means that it costs approximately 70 cents per month to operate an electric refrigerator in the territory.

Q. Are there various specialists whose services are avail- 7568
able to these several divisions? A. I have explained the general sales work to the industrial and the commercial and the residential customers.

—3,200—

Now, when it comes to certain types of installations, it is unreasonable to expect even a well informed salesman to have all of the necessary information in order to do an A-1 job on other types of promotion. The result has been that we have built up, in the Union Electric Group, a series of specialists on the following items: lighting; industrial heating; commercial cooking; air conditioning; and isolated 7569
plant replacements.

In those divisions men particularly qualified for the work that they have to do have been employed, and it is their job to know completely the subject with which they deal. They are of great value in the education of our customers through the opportunities and advantages afforded by the use of purchased electricity.

Without such education, the maximum opportunities for promotion would not be realized. They are particularly valuable in the less populous centers served by the Union Electric

7570 *Charles E. Michel—By Respondents—Direct*

Group where there would otherwise be an insufficient number of customers to warrant the employment of individual experts.

Now, I think that a few words with reference to these several divisions might be pertinent at this point.

The lighting division consists of an organization having two broad responsibilities, the promotion of improved industrial and commercial illumination, and the negotiations

—3,201—

7571 concerning street lighting.

The organization consists of seven trained specialists who negotiate the illumination sales, promotional work on the entire system.

In the industrial and commercial fields, the men in the industrial and commercial staff are constantly making surveys of their own to inform these specialists as to the opportunities for load building within the stores of their customers, and it is then the job of these specialists to supply information on all the problems involved to the customers, as well as to the salesmen.

7572 They have the job of assembling the necessary information from surveys, and have today, for instance, one of their important duties, the guidance of our customers in connection with the complicated fluorescent lamp. Their job is to contact the architects, electrical contractors, builders, owners, illuminator supply sources, the jobber and the wholesaler, the manufacturer, and so forth, in assisting in the solving of the customers' illuminating problems.

What they really do is to supply a consulting illuminating service to the customer. That covers more than going into the details.

7573

They do prepare all the engineering studies and the preparation of specifications and recommendations for the customer and for the dealers' prospects as well.

—3,202—

Q. Now, what do these specialists do with respect to street lighting problems? A. The street lighting problem is a very specialized operation that is handled by the lighting division, and rightfully so because of the intricate nature of the work involved, not only in so far as the equipment is concerned, but in so far as the dealings are concerned.

7574

The illuminating engineer in charge is personally responsible for all of our street lighting work. His procedure is to go into the city—I am speaking now generally of the smaller cities, not of one like the city of St. Louis that has its own illuminating engineering employes—his duty is to survey that city and to lay out scientifically the illuminating system for the city, which includes a survey of major highways, minor highways, and so forth; and the specifications of the distance between lamps, the size of lamps, and so forth.

7575

Once that has been done, and the lamps spotted on a map, it is that man's duty then to present it to the proper public official, as well as to the municipal groups that have the interests of the city at heart, to discuss with them the possibilities of growth in certain districts, or the dropping off of business in certain districts. That has a direct influence on the type of illumination that he might recommend.

After all these different thoughts have been coordinated,

—3,203—

and the final map prepared, it is then his duty to make the presentation before the citizens of the town, let them know

7576 *Charles E. Michel—By Respondents—Direct*

just exactly what has been suggested, and also to the municipal authorities who have to pass on whether or not the illumination shall go in. And they handle it through from that point until the business goes in.

After once gone in, it is that man's duty, with his assistants, to consistently follow up those street lighting installations and to watch out for changes in business conditions, changes in the type of business on different thoroughfares; and to make recommendations for corresponding
7577 changes in the illuminating lay-out, as the business changes take place.

Q. What does the industrial heating division do? A. The industrial heating division's job is the building of the load through the application of electric heating to industrial processes, where such applications result in economies or other advantages to the industrial customers.

There is a large number of applications of electric heat that can and are made to industry to the advantage of, not only our company, but to the customer as well. I might
7578 speak of just a few.

The melting of gray iron has been one very important development. Back many, many years ago, St. Louis was one of the first cities to have the installation of a gray iron

—3,204—

melting furnace made. We cooperated very closely with the customer, he was not at all sure that it would be a successful operation, but it has made that customer into a very successful operation.

A later development, for instance, has been the infra-red heating, the application of heat properly directed and con-

7579

trolled through the use of the carbon lamp. The field is absolutely unlimited. It was a type of development that took place originally in the four factories, and which has been thrown open to the public as a whole. Our men are today charged with the handling of the application of that important development. It is only a young development, just a few years old.

The activities are the conducting of direct-by-mail educational campaigns on industrial and commercial customers, of which there are approximately 700 on the Group's lines 7580
that, in one form or another, may benefit from the application of industrial heating.

Personal calls are made on each lead to study the problems and to make recommendations.

Demonstrations of heating equipment are made in customers' plants, where that is indicated.

For instance, in the small midget type heaters, as we call them, the man has a kit, and he goes from one organization to another, after the proper surveys have been made, to

—3,205—

indicate that some type of industrial heating might be used 7581
to advantage by that customer, and with this kit he lays it out and interests the foreman of the shop.

It might be the installation of a little steam boiler here, an electric steam boiler at some far corner, where so steam was available. Or it might be strip heaters in maintaining temperatures in glue pots—or things of that general type.

The general sales are made, not by our company, but they are made by the manufacturers' agents who are located in the territory, and the demonstration of equipment is usually arranged through the manufacturers' representatives.

7582 *Charles E. Michel—By Respondents—Direct*

Special meetings with the industrial engineers of St. Louis are sponsored by the division where we bring outstanding speakers to these industrial engineers on one subject or another.

The results of the promotion by this division I can sum up very quickly.

The load in 10 years has been increased by 27,713 kilowatts, and at the present time, that is, as of January 1, 1940, stands at 83,815 kilowatts.

7583 Q. That is the electric heating load? A. That is the electric heating load.

The Examiner: Let's have a short recess.

(Whereupon a short recess was taken.)

—3,206—

The Examiner: Let us resume.

The Witness: It is probably appropriate at this time to say something about the air conditioning division of the company.

The air conditioning division was opened in 1929,
7584 was organized at that time. It was among the first air conditioning bureaus organized in the United States. The function of the Group's division is to promote the installation of air conditioning equipment on the lines of the entire Group, and not to merchandise air conditioning equipment but to act in the capacity of a consulting engineer to the prospective buyer in the careful watching of the type and size of installations that are put in.

We find that very necessary because not only too small a unit will give you unsatisfactory service, but

7585

likewise too large a unit will give unsatisfactory service for the reason that too large a unit would operate on very rare intervals, and the control of humidity would not be achieved by such an operation.

So that the department has had to be thoroughly educated and trained in the science of specification of the types and sizes of equipment.

It cooperates with all of the distributors by keeping them constantly informed on the Group's activities, and providing for them assistance in their sales efforts.

7586

—3,207—

Articles of an informative nature are constantly written to both the distributors, their salesmen, and to the public. Open forums are conducted in cooperation with educational institutions. Sales training in air conditioning is provided for the industrial sales force of our company, as well as the commercial salesmen, so that they may uncover and conduct the preliminary negotiations with our customers in connection with air conditioning installations.

7587

When these have reached a point where real interest has been aroused on the part of the customer, then the air conditioning division is called in, and that particular sales operation is turned over to that division who then works in connection with the manufacturer and the distributor of the merchandise.

Statistics of air conditioning installations are currently maintained for the use of the dealers, and the distributors so that they may plan their sales

7588

activities along lines indicated by experience. Special studies are carried on by the department to determine operating characteristics, operating hours, and current consumption of existing installations, and also to keep abreast of the new methods and equipment developed, a most important operation.

For instance, at the present time there is in the development stage the storage type of air conditioning. The cost of installation is quite comparable to

7589

the ordinary compressor type that is in use today, but

—3,208—

it is indicated that the use of the storage type may substantially reduce the cost of operating to the customer, due to the fact that the storage type depends upon night operation for its charging, and providing the storage type is of sufficient capacity and providing the customer is on a demand rate, under the provisions of the demand rate schedule, which permits night demand in excess of the day demand without additional demand charges, reduced costs in operation

7590

seem quite sure.

That development is taking place rapidly, we are watching it carefully, we have made three installations in St. Louis, in which we have cooperated in the installation, and are working with those customers now to develop the real facts.

The results of the growth of the air conditioning load our lines may be stated about as follows: In 1930 there were 26 installations with a connected load of 4,148 kilowatts; and on July 31, 1940, there were

3,154 installations, with a connected load of 36,252 kilowatts.

Now, on a per capita basis, that is a substantial amount of air conditioning load. Remember that it is young and growing.

Q. Are some of these installations residential installations? A. Yes, sir. I will give you some information on that which I consider very important.

As of July 31, 1940, there are 1,475 residential installa- 7592
—3,209—
tions in St. Louis, and that is exceptional. Air conditioning for commercial operation and for sales operation is quite common, but that large a number of residential installations is not as yet common throughout the country.

For instance, another important division there is offices. There are 760 installations in offices in the city of St. Louis; there are 273 retail stores in the city; and there are 159 installations in eating places, such as taverns, within the limits of the Group.

Q. You have spoken of the isolated plants divisions; how 7593
is it organized and what does it do? A. The isolated plant division of the company is a combined sales and service organization responsible for all negotiations with customers and prospects through the system, operating or considering the operation of an isolated plant.

Its main objective, of course, is the obtaining of new business from the replacement of existing plants and also the retaining of existing business when threatened by proposed power plant installations.

7594 *Charles E. Michel—By Respondents—Direct*

The division operates under a specialist who is informed fully on all of the different types of competition to which utility service is subjected. I need not recite those here, but that man is able to sit down and discuss with consulting engineers and plant engineers any type of power, including electric power, and its application to a particular job.

—3,210—

They maintain frequent sales contacts with emphasis laid
7595 on the economy of purchased electricity as compared to isolated plant operation.

The development of the prospects' interests and obtaining the prospects' consent to make a thorough investigation of conditions.

The conducting of engineering and economic studies resulting in a definite proposal indicating comparative advantages.

Selling the prospect on the advantages indicated by the proposal.

The negotiation of contracts for the purchase of elec-
7596 tricity.

By Mr. Hamilton:

Q. Mr. Michel, you might explain what you mean by "isolated plants" in this connection. A. By "isolated plants" I mean plants that are installed or are about to be installed by either the industrial or commercial establishment for the supplying of their own electrical requirements.

It may, and frequently is, run in connection with steam service where the steam requirements for processing purposes are large, and where the demands on the electrical

7597

consumption and the steam consumption and so forth are somewhat coincident there is a very difficult job in holding that customer or selling to that class of customer.

Where that does not exist, with rates as low as the Union

—3,211—

Electric rates, we have comparatively little trouble in combating the isolated plant operation in our territory.

Does that answer your question?

Q. Yes. A. This isolated plant division has, as one of its functions, the familiarizing of the company's sales representatives with the engineering and economic aspects of the isolated plant operation, and the training in the best methods of combating that competition. 7598

Assisting in the handling of negotiations with existing customers where isolated plants are being considered.

The organization consists of one development engineer, two industrial sales engineers, and one consulting engineer, covering all territories of the Union Electric Group.

It operates both directly with customers and prospects through the general sales staff.

The department has been most successful in that operation. It has lost but a comparatively small amount of electric service through the installation of isolated plants in our district. 7599

Q. Now, in addition to the direct merchandising activity of the Group, you also cooperate with wholesalers and dealers in the territory, do you not? A. We have one of the best organized dealer cooperative organizations in the country. It is so recognized in the industry. It was recognized by the McGraw Award that I spoke of way back in 1933,

—3,212—

7600 *Charles E. Michel—By Respondents—Direct*

when the organization was in full swing at that time, and has continued up to the present time.

We have in that work one man only who is directly charged with the cooperative work. He is a sales counsellor who has but one lone job on earth, and that is the development of the dealers' business in our territory. His success or failure in his work depends entirely upon the success or failure of the merchandising operations of the dealers. That man is a capable salesman. He is a well informed man on
7601 dealer cooperation, having been previously in the position of a paid secretary of the Radio Dealers' Association of St. Louis, from which organization I took him because of his wide experience, his wide acquaintance among the dealers, and his natural education and qualification for cooperative work.

He is a trainer of salesmen whose services are available to all dealers in the city. He is a trainer of the managers of salesmen primarily. He spends a great deal of time with them. He is charged with conveying to all retail and wholesale outlets in the city, handling electrical appliances, the
7602 complete details of the sales promotion plans that are developed by the Union Electric Group for the benefit of the dealer.

He is charged with the helping of these people in connection with their advertising programs, showing them from our own experience in our own merchandising work, the features of the different pieces of merchandise which seem to have the greatest appeal to the public.

—3,213—

He is charged with the coordination, as I have said, of those dealer activities with the activities of our own mer-

chandising department, and with the advertising that is put out.

He is charged with handling the public shows and exhibitions, such as the annual Home Show; the dealers' sales counsellor establishes a cooperative participation by the dealers and the company by those types of shows.

He also encourages the dealer to make full use of the home service division of the company, arranges with the home service department for the demonstration, for instance, of a particular electric range, calling into that demonstration the 7604
distributor and all of his dealers, together with their salesmen, where our own home economist educates those salesmen as to the benefits to be derived from the use of that particular range.

—3,214—

All of the advertising that is run in connection with our dealer promotion, and it is very extensive, is signed, not by the Union Electric Group, but by the "Electrical Dealers & Contractors" or, "See Your Electric Range Dealer".

The company's name appears only when we say, "In cooperation with the Union Electric Company", or the "Union 7605
Electric Group", as the case may be.

Plan books are issued to describe each major advertising program, and these are quite important. It has been established now since 1934, and is called the Electric News. The dealers are expecting it, and in it are set forth the promotional plans set up by the company for the dealer.

It goes further than that, and when new pieces of apparatus appear on the market, it describes those pieces of apparatus and just where they fit into the promotional plans to the benefit of the public.

7606 *Charles E. Michel—By Respondents—Direct*

The counselor frequently has our own advertising department work with the dealers in the preparation of their advertising. The cooperative advertising published in the past 7 years, which is over and above the advertising of the Company's merchandising division, included 712 newspaper advertisements, 900 billboards, 2,875 radio spot announcements, 207,000 direct-mail pieces, 17,864 dealer store window displays, and 1,645,000 pieces of printed matter, which was put out over the dealers' names for the purpose of drawing

7607 —3,215—

to those dealers' stores the prospect for one or another type of electrical merchandise.

Q. Now is the result of this program a stimulation of the dealers' activities? A. Very definitely so. The average dealer is usually a little business man. He very frequently is not fully informed on the best principles of merchandising and sales work, and, left to his own devices, he fails to get out of his organization the maximum possible sales.

With the work that is done with these dealers, they are not only stimulated to additional activity, but are informed

7608 properly on these underlying principles that make for their success.

Q. Are there other services provided by the Union Electric Group for the dealers in the territory? A. Yes, sir. In promoting the dealers' work and business, the services of the home-lighting division are at his disposal, as are the services of the different specialists in the company, such as the air-conditioning man, the refrigeration man, and so forth. They work with the dealer and help him in his work.

Q. Will you refer to Respondents' Exhibit No. 51, which sets forth the electric service territory, and tell us whether

the electric service in the entire shaded portion indicated on Exhibit No. 51 is furnished by the Union Electric Group?

—3,216—

A. No, not all of the service is supplied by the group. The group thoroughly covers all of the territory in which we hold certificates of necessity and convenience, but there are certain other groups that furnish some of the service. I might mention that within the corporate limits of the City of St. Louis, there is the Laclede Power & Light Company, which furnishes electric service in competition with our company. 7610
As of the year 1939, they furnished 14 per cent. of the total number of kilowatt hours that were sold within the corporate limits of the City of St. Louis, and their sales, as compared with the Group sales of electricity in its entire territory, were 5.9 per cent.

Q. The distribution of the Laclede Company is confined to the City of St. Louis, is it? A. It is confined to the City of St. Louis, and thoroughly covers a very large proportion of the city. I can best describe what it doesn't cover, which is the southwest section of the city, which is somewhat more sparsely settled than the city as a whole, and furthermore, 7611
has only been developed in comparatively recent times. Their lines do not run into that section, but the rest of the city they cover.

Q. Are there sales by the Union Electric Group to certain municipalities? A. There are three municipalities, small ones, that have their own distribution system and purchase electricity from the Union Electric Group. These are the

—3,217—

cities of Farmington, and Kirkwood, in Missouri, and the small town of West Point in Iowa.

Q. And are there any customers within the territory who are served by cooperatives? A. In the territory in which the group holds certificates, there are three cooperatives that, through spearheads, serve a few customers.

Around the town of Alton, on the north and on the eastern border, and in territory not covered by our company, the M. J. M. Electric Cooperative, Inc., and the Southwestern Electric Cooperative, Inc., operate. These two have a few spearheads into our territory and so serve a total of 8 cus-
7613 tomers that are located in our territory.

In the Keokuk district there is the Appanoose Light & Power Company, a cooperative, which serves a half a dozen customers up there. So that that is a total of about 14 customers that are served by cooperatives.

Q. Has the Union Electric Group, over a period of years, conducted a program of rural electrification? A. It has. The majority of the rural customers that have come to the Union Electric System have come through the acquisition of properties other than the original property, which served the City of St. Louis only. Those rural districts, which were
7614 not served as a general thing by the small properties

acquired by the Union Electric, have been, since that time, the recipients of a great deal of careful thought and service in an effort to have them come on the line.

In the year 1932, I personally took over the direction of service to the rural customers of the company. Prior to that time, it had been looked after by the managers in the several outlying offices which I have enumerated previously.

 7615

In that year I became convinced that we could, to advantage, run our lines further into the rural territory and attract a considerable amount of business.

I put out one man during that year to sound out the farmers on the question of, for instance, soil heating, brooding of chickens, to see whether or not they were interested, and found that they were.

In 1933, a development engineer was assigned to the rural districts to study the situation. His contacts were largely with farmers already on the lines, all of those adjacent to 7616
existing supply lines, and covered not only the use of service but the use of utilization farm equipment.

Early in 1934, we decided that the possibility was such that a comprehensive survey of our entire rural area was indicated. Maps of the territory were secured and the following force was built up to handle the survey:

A utilization engineer in charge; four field engineers; two draftsmen; one estimating engineer.

—3,219—

These men covered practically every road in the territory 7617
over which an automobile could be run. They spotted on the maps the location of each prospective customer and classified these customers as to possible revenues.

They were split into four classifications: The vegetable grower and commercial customer were estimated at about $65 a year for electric service; Class B was a dairy farmer with a small commercial customer, at $35 a year.

—3,220—

Class C was a rural residence or a general farm customer with a revenue of about $25 a year; and class D was

7618 *Charles E. Michel—By Respondents—Direct*

a class of schools, churches, and the little small residence, with revenue of about $11 a year.

Now, these revenues under which they were classified were derived by averages from customers of the same type already on our lines. From a study of these maps we determined that it was possible for us to extend the area feeders which would bring the service within reasonable distance of all prospective customers, and these feeders were put under construction.

7619 When they had gotten under construction and it was evident to the rural customers that lines were being run, we changed the organization from a purely engineering organization to one consisting of a development engineer in charge, three sales supervisors, and eight salesmen, and these men set out to contact every prospective customer within striking distance of the area feeders.

These men were selling not only electric service, but the idea of farm utilization equipment, although they did not sell the equipment itself, but used dealers to actually handle the equipment sales.

7620 Q. I gather from your testimony that the centralization of the rural electrification program in the group began in 1932? A. The centralization, that is correct.

—3,221—

Q. Had there been activity in the field of rural electrification on the part of the group prior to 1932? A. Very definitely, but it was handled, as I said, by the men in the local offices, and was handled just as routine business. It was not a specific, definite drive to get the customers on the line.

Q. Now, what is the record of the Union Electric group with respect to the availability of electric service for cus-

tomers in the rural territory? A. Well, after the company made its first extension of primary area feeders, which constituted 69 miles of such feeders, and after these men had contacted every customer in the rural area who was within reasonable reach of the area feeders, we handled as of 1933—7,512 rural customers, and the miles of line at that time were 517.9.

In 1934, we ran 108.3 miles additional, and picked up 726 customers.

In 1935, we ran 56.3 miles and picked up 1,354 cus- 7622
tomers.

In 1936, we ran 216.2 miles and picked up 1,878 customers.

In 1937, we ran 152.6 miles and picked up 1,075 customers.

In 1938, we ran 109.3 miles and picked up 1,329 customers.

Last year, 1939, we ran 145.7 miles and picked up 1,464 customers.

So that we now have a total of 15,338 customers.

7623
—3,222—

Q. And a total mileage of what? A. And a total mileage of 1,306.3 miles.

Q. Now, I think you had better explain what you mean by the term "rural" as applied to the figures which you have just given. A. Rural customers today are defined as those customers lying in the territories at which our rural rates apply. They are outside of the metropolitan areas in which the same rate applies in all area, but it is slightly higher in the rural area than it is in the metropolitan area, and all customers in that area are classified as rural customers.

7624 Consequently, if there is a town located in the rural area that is classed as a suburban district, it is deducted in computing the number of customers in the rural area.

Q. Are you able to give us any figures as to the percentage of coverage within this so-called rural area of potential customers? A. I can say this, that at the present time 60 per cent. of the available business is already connected to the lines. There remains 40 per cent. to be, I hope, gotten sooner or later.

7625 In considering those figures, permit me to say that our rural areas are somewhat sparsely populated and none too productive, due to the fact that a large part of the rural areas district lies in the foothills of the Ozark Mountains, and there are many districts up there which it is awfully hard to get to with lines, and having gotten there, the cus-

—3,223—

tomers are not in a position to take service regardless of how cheap it may be brought to them.

Q. What are the policies of the group with respect to line extensions within the rural territory? A. In connection with

7626 the extension of line to the rural customers, as I have stated, after the survey was made we ran area feeders, which covered practically all of the larger roads in the territory. From these area feeders it becomes necessary to connect the customers from one side to another, and the company will invest three years' estimated revenue per customer, but not less than $50 per customer. The customer has the privilege of guaranteeing three years' revenue equal to the cost of the extension, or of depositing the difference between the estimated annual revenue and the cost of the extension. These deposits are subject to refund based on the amount by which

 7627

the actual first three years' revenue exceeds the company's investment, and $30 for each new residential customer added during the first five years. No refund, of course, is made of the total amount of deposit beyond that which has been put up.

Q. Now, the investment of which you have spoken is a figure, is it not, related to a particular line extension, to a particular customer? A. That is correct, sir.

—3,224—

Q. Does the program of rural expansion which the Union 7628
Electric group pursues, cover all classes of service to the rural customer? A. It does. As I have previously stated, we have two men in charge of the development of the rural territory, both of whom are graduates of the University of Missouri, holding the degree of B. S. in agriculture. Those men direct the sales force that operates in the rural districts. During the past six years, 366 meetings were held with the rural groupsson the use of small appliances, major appliances, home lighting, farm applications of electricity, and the total estimated attendance was 25,625 people.

During the same period more than 100,000 mailing pieces 7629
was sent to the farm customers on farm applications of electricity, including brooding, poultry house lighting, poultry water heating, milk cooling, soil heating, green house lighting, and household applications.

The company's rural service representatives have been responsible for an addition of 1,545 installations of electrical equipment during the past 5 years. That is farm utilization equipment.

The magazine "Electricity to the Farm," which is a national magazine, is mailed to 1,200 farmers each month, for

7630 *Charles E. Michel—By Respondents—Direct*

which there is no charge made. The educational work is carried on with the full cooperation of the State Agricultural

—3,225—

Extension Service and other State and Local farm agencies.

Displays and exhibits are held each year at county fairs and other agricultural functions. An average of 200 personal calls on rural customers is made each month by the rural service representatives.

7631 The Examiner: We will recess until two o'clock.

(Whereupon, at 12:20 o'clock p. m. a recess was taken until 2 o'clock p. m. of the same day.)

—3,226—

7632

AFTERNOON SESSION

(Whereupon, at 2:00 o'clock p. m., the hearing reconvened.)

Whereupon CHARLES E. MICHEL resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton:

7634

Q. You were discussing rural electrification, Mr. Michel. Would you describe what, if any, obstacles confronted the Union Electric group in the course of developing its rural electrification program? A. In the rural territory served by the Union Electric group, we extend all the day from the rich bottom lands in Missouri, along the river into the foothills of the Ozark Mountains and the problem in the two different districts is quite dissimilar.

In the lowlands, the farms are of considerable size, the soil is rich and the farmers are reasonably prosperous. In those territories the type of promotion has to be quite different from that which we use in the vast majority of our rural territory. The vast majority of that rural territory is located in the foothills of the Ozark Mountains.

7635

Previously I testified to the fact that we had made a careful survey over all of the roads in the territory on which we could run an automobile. That, of course, took us into the sparsely populated and hill districts of the Ozark terri-

tory. In that territory there was no such thing as a large farm. It consists, primarily, of small acreage, stony ground,

7636 *Charles E. Michel—By Respondents—Direct*

and the products of the little farms are largely tomatoes, or some grapes, a few apples, and things of that kind.

It is seldom that you will find in those districts any grain farmers. You do find a few poultry farmers and a few dairy farmers. In the survey that was made, it may be interesting for me to say that not on one occasion, but on several occasions we encountered homes that had no doors and no windows in them; just shacks that were covered with burlap, and we had quite a considerable amount of difficulty in inter-
7637 viewing those people and we insisted on interviewing them to find out what their conditions were, whether or not they were interested in electric service in the homes, and upon their little farms, and then we ran up against that condition of affairs where the farmer not only was put to it to try to pay the small electric bill that was involved—and I may say right here that the minimum charge in our territory is only 75 cents a month against the amount of service that they guarantee to use—and they not only couldn't pay the 75 cents a month, but the matter of wiring their little homes and the matter of the purchase of necessary utilization equipment
7638 was completely out of the range of possibility with those people.

Now, as I say, we talked to everyone of these farmers

—3,228—

that were within a thousand feet of our area of feeders, so we determined that if we were to be successful in those areas, that we probably never could take the very poor grade of farmer, or habitant that was there, that I just described, that we would have to point toward a man who would have some possibility of use of electricity to his advantage.

Then we had to set up some method of getting that apparatus in the hands of that man on terms that were within his possibility of meeting. We set up a deferred payment plan for these farmers on all of the utilization equipment that he could use in his home—I am talking now of directly in the house, domestic appliances—and in those cases, we would carry his account for him.

In the case of farm utilization equipment, a different sort of problem presented itself and that was the sale of items such as brooders, soil heating, and so forth. In those cases, 7640 we encouraged the dealers to go into the business and to attempt to sell the farmers direct.

We also extended a plan to those dealers that we have in operation in the City of St. Louis. That is, he sells his customers and asks us to carry on the light bill the deferred payment accounts.

Those deferred payment accounts are entered on our light bill, are billed to the customer, and when the money comes in, it is sent to the dealer. In a case where the customer becomes sixty days delinquent, we simply return to the dealer

 7641

the original paper which he sent to us and it is up, then, to the dealer to deal and work with his customer on the collection work. In other words, we will not become a definite collection agency for these dealers beyond the reasonable willingness to pay of the customer that is there.

That made it rather difficult in those districts, as you can easily understand. The fact that a water system would cost that man maybe one hundred or a hundred and fifty dollars, and the other apparatus somewhat less—now, in an

effort to make it more feasible for those smaller customers to purchase, for instance, the electric range, which we believe to be one of the things that he can use to advantage, we have gone into a plan of promoting a very low-priced electric range.

It sells for about $55.00, and that range, in certain sections of the territory, is being promoted at the present time in order that we determine how the customers accept it. If we find a general acceptance, we will extend the plan to
7643 the entire territory, but, generally speaking, when you get into the Ozark Mountain district, you find the economic situation of those people that live there, with certain exceptions, rather strained.

Does that answer the question?

Q. I think you stated this morning that you actually had on your lines approximately 60 per cent. of prospective customers in the rural territory. Do you mind amplifying that statement just a little further? A. No, sir; I will be glad to.

—3,230—

The development of policies and methods used in the
7644 expansion of the Union Electric group to bring electric service to the prospective rural customers in the large, unserved areas in this territory, were the result of specific studies of the problem of rural electrification.

Governmental agencies and private utilities use different definitions of rural areas. It was felt at the time that, if possible, the rural areas should be defined in such a manner that they would, for many years in the future, be well-defined and established areas.

For this reason, the Union Electric group selected and defined a specific rural rate zone. The rural rate zone covers

practically all of the farming area in the territory and includes only a limited number of incorporated areas.

The largest incorporated community has a population of 311. This manner of defining the rural territory necessarily includes much less territory than if the United States Census Bureau definition of area outside of communities of 2,500 or more population had been used.

Information and data on rural customers can, therefore, be considered as covering a typically rural territory and not one of a suburban or urban type. 7646

The definition gives further weight to the successful elec-

trification of the territory as, in this territory, more than 60 per cent. of all the prospective customers have electric service.

Now, it is the definition of that prospective customer, I believe, that is wanted. When we made the survey of the territory, as I have already described it, we included all customers within 1,000 feet of the area extensions as prospective customers, and, as of the report handed in by my men, which was dated the first of this year, 60 per cent. of all 7647 prospective customers, as defined, have now added electric service.

Q. 60 per cent., then, of all persons having residences within 1,000 feet of your lines, is that correct? A. Within 1,000 feet of the area feeders.

Q. Are you able to give us any statistics as to the consumption of electric energy within the rural territory and also as to the average cost to the consumer within that territory of the current purchased? A. I believe you asked, first, for the number of customers.

7648 *Charles E. Michel—By Respondents—Direct*

Q. My question related, specifically, to the consumption, average consumption. A. Average consumption?

Q. And to the cost of that consumption. A. During period April 1, 1935, through March 31, of 1937, records were maintained by the accounting department of the energy

—3,232—

consumption by farm customers for the Missouri territory only. At the end of March 31, 1936, the average yearly consumption by those farm customers was 1,063.9 kilowatt
7649 hours per year. For the year 1937, corresponding period, the consumption was 1,165.0 kilowatt hours. So that the annual increase by those customers during that year's period was 92.1 kilowatt hours.

Q. Well, now, subsequent to the date of those figures, was the classification changed due to the fact that the Federal Power Commission has specified a new classification which does not permit us to keep the pure farm customer? A. We are now conforming to the Federal Power Commission's rulings and I can't give the figures beyond 1937.

Q. On a basis per farm? A. On a basis per farm.

7650

Q. Are you able to give it on a basis of per rural residence customer? A. No, sir, I can not give that on the basis of per rural customer.

(Discussion off the record.)

By Mr. Hamilton:

Q. Will you verify, Mr. Michel, and see if you can give us the answer to the question I have just put to you? A. Yes, sir, I can give the answer.

The average kilowatt hour consumption per rural residence customer in 1939 was 374 kilowatt hours and the average cost per kilowatt hour for the residential service

—3,233—

in the rural area of the system was 3.69 cents per kilowatt hour.

Q. That figure of average cost being also for the year 1939, is it not? A. That is correct, sir.

Q. Now, are you able to outline for us, generally, the nature of the residential rate schedules in effect in the Union 7652
Electric group? A. Yes, sir.

The Union Electric group residential rates are comparable throughout the entire territory served. The areas are divided geographically to take in the St. Louis City, County, urban, East St. Louis and Alton urban. The second division is St. Louis County suburban district; the third is St. Louis County rural district; the fourth is the outlying Missouri urban, East St. Louis and Alton rural; and the last is the outlying Missouri territory.

As these territories have come into the Union Electric system, we, of course, inherited, with the different companies, 7653
an enormous number of different rates. We have been able, in case of the residential rate, to bring practically all of the service to residential customers under what is known as the "block meterrate."

There is one form of rate schedule which applies to the whole territory and uniformity in residence rate has progressed to the point where all active residence rates in

—3,234—

Missouri, Illinois, and Iowa territory are of the block meter type, with 30 or 32 kilowatt hours in the first block, 168 or

170 kilowatt hours in the second block, and the third block for use in excess of 200 kilowatt hours per month.

So that we have one residence rate under which all service used in the residence is billed for under that rate. The St. Louis City and the urban districts around in St. Louis County and Alton and East St. Louis, the rate is the first 32 kilowatt hours per month at 5 cents; the next 168 kilowatt hours per month at 2½ cents; and all excess at 1½ cents.

7655 In the suburban district, which is that district lying just outside of the urban territory, the rate is identical excepting that the first step carries a 6 cent charge instead of a 5 cent charge. That is, the first 32 kilowatt hours.

In no territory, including the rural territory, have we any top step in our residence rate higher than 7 cents.

The outlying Missouri territory, rural, which we have been discussing, has 32 kilowatt hours per month at 7 cents, the next 168 at 3 cents, and over 200 kilowatt hours per month at 2 cents. That carries a minimum bill for our rural territory of 75 cents a month.

7656 In the urban territory, the minimum bill is 50 cents a month.

Now, in the Iowa territory, we had certain difficulties

when we attempted to equalize the rates with the rest of the territory. Always, when we would take over a piece of property, as we did in that case, we have found rates that were not what we would term sound rates. They might have steps in them that did not represent what we considered the proper steps, and there were points where the

normal rate might not, for an individual customer, produce as low a rate as he had.

In those cases, we let the rate alone until such time as the reduction in our general rates were such that we could step in and wipe these other rates out. That keeps us from raising the bill of any of the customers.

In the Iowa territory, today, the rates are 6½ cents for the first 30 kilowatt hours a month, as distinguished from five at 32 in the more densely populated district around St. Louis, the next 170 at 3 cents and over 200 kilowatt hours 7658
per month at 2 cents.

In the rural areas in Iowa and Illinois, the first step is 30 kilowatt hours per month at 7½ cents, the next 170 at 3 cents, and all over 200 kilowatt hours per month at 2 cents a kilowatt hour.

Q. I don't believe, Mr. Michel, you gave the precise figure for the second and third blocks on your schedule which commences at 6 cents per kilowatt hour for the first 32 kilowatt hours per month. A. Yes, sir.

—3,236—

Q. Will you give that? A. I think it possible that I did 7659
not.

That is for St. Louis County suburban. The St. Louis County rural is 7, 2½, 1½. That is the third classification that I gave. It is 7, 2½, 1½.

Then the outlying Missouri urban territories are 6, 3 and 2, and the rural I gave was 7, 3 and 2.

Does that answer the question?

Q. Yes. In general, what are the other rate classifications, aside from that for residential service? A. If I may,

7660 *Charles E. Michel—By Respondents—Direct*

and if it answers the purpose, I will describe the rate classifications that cover 85 per cent. of all customers served by the Union Electric group, and the variations from that I will be glad to give you as they are desired.

I have discussed the residence rate as it applies not only to the urban district but to the several geographic districts that we have.

We have five general rate schedules. One residence rate, one general commercial rate, one standard rate—the last
7661 two applying to commercial business—one large light and power rate, and one high load factor rate—the last two applying to large industrials and commercial establishments.

The general commercial rate is available for commercial lighting and/or power. The rate is:

The first 300 kilowatt hours per month at 5 cents;

The next 300 at 4 cents;

The next 400 at 3 cents;

The next 4,000 at 2½ cents;

And all over 5,000 at 2 cents.

7662 There is a load factor clause in that rate which states that for all use in excess of 5,000 kilowatt hours per month, which is also in excess of 200 kilowatt hours use of the demand, the charge will be 1½ cents per kilowatt hour.

That is applicable, as I say, to the small lighting and power business.

The other rate, which is applicable to the same class of business, is known as our standard commercial rate. It carries a yearly demand charge of $12.00 per kilowatt per year, payable in monthly installments, plus an energy charge

for the first 1,000 kilowatt hours per month, 3 cents per kilowatt hour.

For the next 4,000, 2½ cents per kilowatt hour. All over 5,000, at 2 cents per kilowatt hour.

These rates are all subject to a prompt payment discount of five per cent. on the first $25.00 per month, and one per cent. on the excess.

Now, for the large business, the two rates that we have, one known as the large light and power rate is taken under service contracts for three years or more, and for not less 7664
than 150 kilowatts of demand.

The service is supplied and measured at primary voltage.

The demand charge for each kilowatt of the first 200 kilowatts of demand is $1.66⅔ per month—that is $1.66⅔.

For each kilowatt of the next 800 kilowatts of demand, $1.25 per month.

For each kilowatt in excess of 1,000 kilowatts of demand, $1.00 per month, payable monthly, plus an energy charge for the first 300 hours use of the demand, 7 mills per kilowatt hour. 7665

For the next 200 hours use of the demand, five mills per kilowatt hour.

All excess over 500 hours' use of the demand, 3½ mills per kilowatt hour.

The rate is subject to a coal clause, adjustment for coal cost.

The demand is defined as the highest average load in kilowatts existing in any period of 15 consecutive minutes, and the billing demand to be used as the basis of determining

the demand and energy charges for the month will be either the demand established during that month, between 7:00 a. m. and 10:00 p. m., or 50 per cent of the demand established during that month, between 10:00 p. m. and 7:00 a. m., whichever is the higher.

Billing demand, as I said, will be for not less than 150 kilowatts. The minimum monthly bill will be the demand charge based on the highest billing demand established during the 12 months ended with the current month.

7667 For primary high load factor service on three-year contracts the schedule is the first 365 hours use of the first

200 kilowatts of demand per month—1.5 cents per kilowatt hour. First 365 hours use of the next 800 kilowatts of demand per month—1.0 cent per kilowatt hour.

The first 365 hours of use of all over 1,000 kilowatts of demand per month, 8½ mills per kilowatt hour.

All kilowatt hours in excess of 365 hours use of the total demand per month, 3½ mills per kilowatt hour.

The rate is subject to a coal clause the same as in the
7668 case of the large light and power rate.

The demand upon which energy blocks will be based in billing is defined as the highest average load in kilowatts existing in any period of 15 consecutive minutes during the month. No demand of less than 150 kilowatts will apply.

The minimum monthly bill will be the application of the above charge to not less than 365 hours use of the demand established during the month, but in no case less than the following charges, based on the highest demand established during any of the preceding 11 months:

The first 200 kilowatts of demand, $1.66⅔ per kilowatt per month.

The next 800 kilowatts of demand, $1.25 per kilowatt per month.

All over 1,000 kilowatts of demand, $1.00 per kilowatt per month.

Prompt payment discount as described above applies to this rate also.

—3,240—

Now, that is the five different types of rates that we have 7670
and under which our customers are taken. They are applicable, with variations in their charges to different geographic districts, but the rates that I have already named to you cover 85 per cent. of all the customers served by the group.

Q. Is that 85 per cent. in number of customers? A. Yes, sir. That is in number of customers.

Mr. Hamilton: Will you please mark this diagram as Respondents' Exhibit No. 61 for identification?

(The document referred to was marked Re- 7671
spondents' Exhibit No. 61 for identification.)

By Mr. Hamilton:

Q. Will you please state, Mr. Michel, what Respondents' Exhibit No. 61 for identification represents? A. This line graph shows the average rate per kilowatt hour paid by residential customers from the year 1912 to the year 1939, inclusive.

For the same period it shows the national average as given by the Edison Electric Institute data.

7672 *Charles E. Michel—By Respondents—Direct*

It also shows the average yearly kilowatt hour use by the residential customers during the same period and the average yearly kilowatt hour use for the nation as a whole.

Q. Has this diagram been prepared under your supervision? A. Yes, sir. It has.

Q. The information given covers data for the Union

—3,241—

Electric Company of Missouri and its subsidiaries? A. Yes, sir.

7673 Q. And the facts shown as to those companies have been taken, have they not, from the records of the respective companies indicated? A. That is right.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 61.

Mr. Binford: No objection.

The Examiner: It is admitted under the number mentioned.

(The document referred to was received in evidence as Respondents' Exhibit No. 61.)

7674

By Mr. Hamilton:

Q. In order to clarify the exhibit, Mr. Michel, will you give us the precise figures at 1912 and at subsequent periods —let's say at ten-year intervals—as shown by the exhibit? A. In the year 1912 the average use by the residential customers was 285.6 kilowatt hours. I do not have the national figure as of that year.

The Union Electric group customers paid an average of 8.89 cents per kilowatt hour for their use, and the national

average during the same year, taken from the data obtained from the Edison Electric Institute statistical bulletins No. 2, 1935, and No. 7, 1940, show that the national average was 9.10 cents per kilowatt hour.

—3,242—

Q. Now, state the same figures, if you will—or comparable figures, rather—for 1920. A. 1920?

Q. Yes. A. The Union Electric group average, as of 1920, was 395.2 kilowatt hours per year.

The national average was 339 kilowatt hours per year. 7676

The Union Electric rate average was 5.8839 cents per kilowatt hour, and the national average was 7.45 cents per kilowatt hour.

Q. Now, again, at 1930 and at 1939, if you will? A. 1930?

Q. Yes. A. In 1930 the average kilowatt hours for the Union Electric group was 618.9.

For the nation as a whole it was 547 kilowatt hours.

The average rate paid by Union Electric customers was 4.4510 cents per kilowatt hour, and, for the nation as a whole, was 6.03 cents per kilowatt hour. 7677

As of 1939 the average consumption in the Union Electric group was 1,014.7 kilowatt hours against the national average of 900 kilowatt hours, and the average rate paid by the Union Electric group was 3.2266 cents per kilowatt hour against the national average of 4.06 cents per kilowatt hour.

In other words, in 1939 the Union Electric consumption,

—3,243—

average consumption, per residence customer was more than 12 per cent. higher than the national average, and Union

Electric's charges on the average kilowatt hour was 20½ per cent. lower than the national average.

Q. Now, are you able to give us the date on average use or average rate paid by consumers in other than residential classification of service? A. Yes, sir. I am. For the year 1939 I have given the residential rate average as 3.2266 cents per kilowatt hour. From the small light and power business for the same year, the average rate was 3.05 cents per kilowatt hour.

7679 From large light and power business the average rate was .85 cents per kilowatt hour.

For the total sales of electrical energy by the group, the average cost was 1.42 cents per kilowatt hour.

Q. Now, will you indicate, Mr. Michel, the largest customers on the Union Electric group system? A. The six largest customers—expressed in demand; not connected load—is 91,800 kilowatts.

Q. That is, the total demand of the six largest customers? A. That is the total arithmetical sum of the maximum demands, individual customers.

7680 Q. And that is for what period? A. That is for the period ending with September 30, 1940.

Q. Turning, now, to the matter of rate reductions, will

you indicate very briefly the number of rate reductions over a period of years, effected in particular classes of service, and indicate generally the sum total of those reductions in each class for the same period? A. In the period September 1, 1919, to June 15, 1940, there were 82 reductions in rates made by the Union Electric group.

51 of those reductions applied to the Union Electric Company of Missouri, and 31 applied to the subsidiaries of the Company.

In all, and in both territories combined, there were eleven reductions in residential service, 37 reductions in commercial service, 18 reductions in industrial service, and 16 reductions in other classes of service. A total of 82. And applying the rate reductions to either all of the customers or to a large sampling of the customers, for their use prior to the 12 months during which the reduction is made, the total 7682 reduction is found to be $6,016,183.00 per year.

Q. Now, that is the sum total, is it not, of the 82 reductions to which you refer? A. That is correct.

Q. Will you give us the breakdown as between the different classes of service in dollars? A. In dollars?

Q. Yes. A. Yes, sir.

—3,245—

In the residence service in which there were 11 rate reductions, the total amount is $1,928,277.00.

In the commercial service, where there were 37 reductions the amount is $2,837,305.00. 7683

In industrial service, where 18 reductions were made, the total is $1,039,696.00.

To other services, of which there were 16 reductions, the amount is $210,905.00.

Making the total of $6,016,183.00.

Q. Now, have you any data indicating an increase or decrease in the use of electric energy as between the various classifications of service to which you have referred, during the year 1940, over a comparable period in 1939? A. I have the data for the year 1938 and the year 1939.

7684 *Charles E. Michel—By Respondents—Direct*

Q. Well, can you give us any interim figure for 1940 as compared with 1939? I think the comparison between '39 and '38 is probably adequately indicated by the exhibit. A. Yes, sir.

The kilowatt hour sales during the first eight months of 1940 to the major service classifications, indicates the following:

The residential, urban, and rural, shows an increase of 9.05 per cent.

7685 The large light and power industrial group shows an increase of 16.61 per cent.

—3,246—

The small light and power group shows an increase of 7 per cent.

The sale to other electric utilities shows an increase of 11.61 per cent.

The sale to railroads and railways shows an increase of 2.84 per cent.

Q. And the composite? A. Is an increase of 12.38 per cent. over the previous year.

7686 Q. Now, if you will give us the breakdown between major classifications of service in sales of kilowatt hours for the year 1939, giving, if you will, percentages of total sales. A. Yes. During the year 1939 the kilowatt hour sales, divided according to the major service classifications, and the per cent. of these sales to the total, were as follows:

Residential, urban and rural, $309,987,615. The per cent. of the total sales was 14.48 per cent.

The sale to the large light and power group was 1,020,297,591 kilowatt hours, and was 47.67 per cent. of the total.

The small light and power group was 237,653,585 kilowatt hours, representing 11.10 per cent. of the total.

The sale to public authorities was 47,651,084 kilowatt hours, representing 2.23 per cent. of the total.

—3,247—

The sale to other electric utilities was 401,412,412, representing 18.75 per cent. of the total, and the sale to railroads and railways was 123,506,900 kilowatt hours, representing 5.77 per cent. of the total.

The total sales being 2,140,509,187. 7688

Mr. Hamilton: May we have a little recess?

The Examiner: Yes. We will take a short recess at this time.

(Whereupon a short recess was taken.)

The Examiner: You may proceed.

By Mr. Hamilton:

Q. Is the matter of rate schedules, Mr. Michel, a subject of constant study and investigation by the Union Electric group? A. Yes, sir. It is one of the most carefully thought out and studied problems that we have. 7689

In the sales department we have a rate and statistical division in which there are five men.

Those men are engaged, year in and year out, in the study of our rate schedules in all different divisions.

One of the primary studies that these men make is the division of the total kilowatt hours purchased under the different steps of the rate.

Now, when I say that we have some 350 thousand customers, it is easy to understand what a monumental task that is.

—3,248—

Furthermore it is absolutely essential to know those figures before an intelligent reduction in a rate schedule can be made. We, without them, would not be sure that we were according the customer an equitable reduction, nor could we be sure of the reduction in revenue that the company
7691 suffers by each such reduction.

The reduction, in the case of the residence rate, is never made with a sampling of less than ten per cent. of the total number of residential customers for one year's billing by months.

By plain multiplication it shows that there are some 330 bills that must be analyzed in order to arrive at just what we are doing.

In the case of the larger customers, the rate is applied to every customer's consumption for a period of one year, by months, because of the fact that the variation in those
7692 customers is very large and the fact that the possible percentage error by a sampling would be very large.

We have found that the ten per cent. sampling in the case of the residential customer assures accuracy to within approximately two per cent.

Of course, the application to the large customer is almost one hundred per cent. accurate.

In making these studies it is quite essential that we consider all classes of competition with the Company for its

—3,249—

electric customers.

 7693

We, in common with all other utilities, have this competition with us always, and a mistake in your rate reductions could very easily be a very expensive thing to the company, not only in the loss of revenue by an incorrect rate analysis but by loss of customers to some competitive form of service.

Q. Have you finished your statement? A. On that particular point.

Mr. Hamilton: Mr. Examiner, I am just about finished with Mr. Michel. 7694

There are a few things I would like to check on the transcript before turning him over for cross-examination.

I wonder if we could resume tomorrow, briefly, and then, if acceptable to you, go ahead with the cross examination.

Mr. Binford: I have no objection.

(Discussion off the record.)

The Examiner: All right. We will recess until ten o'clock tomorrow morning. 7695

(Whereupon, at 3:35 p. m., the case was recessed until 10:00 a. m. the following morning.)

7696

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

7697

Hearing Room 1101,
Securities and Exchange Commission Bldg.,
Washington, D. C.,
Friday, November 8, 1940.

Met, pursuant to adjournment, at 10 o'clock a.m.

7698

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for Respondents.

RALPH C. BINFORD, Attorney for the Securities and Exchange Commission.

Charles E. Michel—By Respondents—Direct 7699

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon, CHARLES E. MICHEL resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Resumed):

Q. You testified yesterday, Mr. Michel, that Laclede Power & Light also provided electric service to St. Louis, 7700
and that in addition there were sales by the Union Electric Group to three municipalities, which distributed over their own distribution lines, and that there were certain very minor sales by cooperatives in the territory.

Other than those three groups which I have named, is there any electric service sold or provided by any other electric utility in the territory covered by the Union Electric Group? A. No, sir; there is not. We serve the entire territory with the exception of those that I gave yesterday.

Q. You testified yesterday also that during the period 7701
from 1919, I believe, to 1924, you had served in a dual capacity in St. Louis, and also with the Milwaukee Electric Railway & Light Company. During that period of dual service, just what did you do in Milwaukee? A. I was assigned by the executives of the North American Company to go to Milwaukee and study the merchandising situation.

—3,252—

I did. My first visit extended over some two or three weeks, and I at that time surveyed the buying habits of the people of Milwaukee.

7702 *Charles E. Michel—By Respondents—Direct*

I then made a careful survey of the company's policies in connection with promotion work, in connection with their relations with dealers, in connection with their types of merchandise which they handled, and so forth.

At the end of that time I realized that the first thing that had to be done was to provide proper quarters for the merchandising department to operate in. I arranged with the architect for the construction of such quarters. They were actually built, and after they were built I took charge
7703 of the actual operation of the department.

I made a clean sweep of the type of merchandise that was being handled, appraising it item by item with the merchandise that my experience had indicated to me was the best for the public use, and also called meetings of the dealers, and very frankly explained to those dealers our objectives and what our present methods would be.

When I went there I found the revenues from their merchandising operations, which included not only the appliance business but certain jobbing work that they did in connec-
7704 tion with wire and motors and things of that kind, ran to about a little over $300,000 a year. The merchandising business itself, as I remember it—this is a long time ago—was about $75,000.

At the end of the five-year term, when I left there due to press of business in the St. Louis office, the sales had run up to in excess of $1,000,000 a year.

It was not always easy to substitute the type of merchandise that I was quite convinced was best, in the Milwaukee situation.

 7705

I might give you just one example. It was in connection with washing machines. In those days they had what they called the Dolly type washing machine. It consists of three little pegs extending down into a tub, and the motor on top worked it back and forth. It was an obsolete type of washer even then, but it sold for about $45 or $50.

I substituted for that washer a washer that sold for about $100, and Mr. Way felt that I was going too far, that I was trying to put too expensive merchandise over on the public in Milwaukee, and I had quite a long time convincing him 7706
that the other was obsolete and out of the picture, which has since proven to be true. You couldn't buy one today to save your life.

That is just one example of the changes that were made in order to accomplish the results that we did accomplish.

Then our relationship with the dealers was very satisfactorily set up. We did not camouflage the situation at all. In open meetings I explained to these dealers that we were

not philanthropists but that incidentally our objective and 7707
their objective was a common objective, that what we were interested in was getting out on the lines the maximum amount of domestic utilization equipment that could be used by our customers to advantage because of the fact that that helped build our load, which in turn had very definite beneficial effect on our rate structure, and that they were interested in the selling of the maximum amount of merchandise, and that consequently we were there to help them and not to hurt them.

7708 *Charles E. Michel—By Respondents—Direct*

They accepted that situation and we went along, and to my belief they are still operating along those general lines.

Q. During the period of five years you have referred to, how frequently were you in Milwaukee on the business of the Milwaukee Electric Railway & Light Company? A. When I first went to Milwaukee, I used to spend close to two weeks out of each month, until such time as I got over the rather arduous task of reconstruction of both the physical facilities and the organization. My memory would say that
7709 that was about two years.

At the end of that time I cut my visits down to about every other week, and would spend three or four days there.

Then the situation in St. Louis became such that more and more of my time was required there. You realize that I was sales manager of the St. Louis organization, having the merchandising business under me also, and I finally had a schedule of leaving St. Louis on Friday afternoon,

—3,255—

arriving in Milwaukee Saturday morning, working Saturday and Sunday, leaving there Sunday evening and back on
7710 my job in St. Louis on Monday morning—and I carried that through for some two years, as I remember it, before I relinquished the direct visits to Milwaukee, after which time, at the request of Mr. Way, I acted as a consultant whenever they wanted to talk to me about matters. They would come to St. Louis at times, and at times I went to Milwaukee for consultation when changes were in the wind.

Q. During the period of your active service in Milwaukee, were you in charge of the merchandising of the Milwaukee Electric Railway & Light Company? A. I was; yes, sir.

 7711

Q. In the field of your sales work, does the Union Electric Company of Missouri interchange information with other subsidiaries of the North American System? A. Oh, yes; oh, yes.

Q. Will you indicate the nature of that information, and indicate also how frequently that interchange occurs? A. Well, the principal interchange of information at the present time consists in the interchange of advertising material. That material, of course, is gotten up by the different companies after their sales policies have been determined, 7712
and their objectives set forth, and the publicizing of the

merchandise or the policies are put in the form of newspaper advertising, bookets, pamphlets, or what-not.

We boys in the sister companies interchange that advertising constantly. It comes over my desk in a constant stream, and I read it carefully, and route it to that portion of the sales department in which I think it will do the maximum good.

I might give just one example. There is a little patented 7713
figure known as "Reddy Kilowatt" that is being used by certain utilities for the purpose of being able to talk in a more familiar manner to their customers in their advertising,—"Reddy Kilowatt does the talking; he tells how good an electric range is", and so forth.

Frankly, I was not very well sold on the use of that sort of a device, I didn't like it, but I kept reading these ads that came through from Milwaukee, Frank Coffin used to send them to me, he is the vice president in charge of sales at Milwaukee; and Harold Brooks of Washington, and I gradu-

7714 *Charles E. Michel—By Respondents—Direct*

ally changed my mind on the subject, and determined to try the little gadget out.

I went into it in a very modest way to start with, I wouldn't let it appear in any of our institutional advertisements, nor be used in connection with any of our bills or letters that went out to our customers other than the straight merchandising, which is a moderate use of the symbol and of the possibilities of that symbol.

—3,257—.

7715 But by constant reading of these advertisements that I have been receiving from these other companies, I have enlarged the use of the symbol and I think to the very definite advantage of our company.

That is just one example of the type of information that we get out of these advertisements that come in. There are numbers of others that I might mention.

Q. What does this advertising material consist of that you have referred to? A. The advertising material consists of a galley-proof of the newspaper advertising, of the booklets that are gotten out, of the pamphlets and all types of
7716 advertisement which is put out to reach the public.

Q. The material is exchanged prior to publication, is it? A. Generally it is received before it even goes out. For instance, in our own case we have a regular schedule for advertising; it is set up the first of the year; the money is allocated, the amount that is going to be spent, by months, the items that are going to be advertised in those months—they are all set up.

Then the ads are drawn, and they are worked on ahead of time, so that we won't have a last-minute rush in getting

up advertisements, which is a curse to the advertising business.

—3,258—

As soon as those are ready, I send them out to these boys in the sister companies that I deal with, and they do the same thing with me. The consequence is that I get theirs and they get mine usually before they appear in the daily press.

Q. How frequently does this interchange take place? A. Well, it is in more or less of a constant stream. I don't think 7718
that there is a week that goes by that I don't receive one or two sets of advertising from the different companies.

Q. Is this interchange of value to the Union Electric Group? A. I think it is very distinctly of value to the company. There is no one man that has got a corner on all the ideas, and the ability to put them over, and if you can consult in an intimate way and get intimate details from other sales managers who have had a wide experience, and a record of achievement behind them, it is undoubtedly of value. That applies to me or to any other man in that line of work. 7719

Q. Do you know other sales managers of other subsidiaries of the North American Company personally? A. Oh, I know them very well.

Q. Do you see them on various occasions? A. Yes, sir; I do. I generally see these men at one of the national meetings that occur, one of the national committee meetings, or one of the general conventions. That is almost a constant

—3,259—

thing, and I see them at those meetings.

7720 Q. Do you see them only at the general meetings? A. No, I don't see them only there, but that is the majority of the contact at the present time.

Q. Do you discuss sales problems with these other sales managers whom you see at the meetings? A. Oh, yes; with George Miller, of Cleveland; Harold Brooks, of Washington; and Frank Coffin, of Milwaukee. We make it a practice to get together and have some very intimate discussions of our several problems. We exchange information on rates,
7721 on prospective business, and matters of that kind.

Q. Do you mean by your statement that you meet with these gentlemen independently of the industry meeting at which you all happen to be present? A. Oh, yes. The type of information that we discuss when we get around a little round table is totally different from that which we would discuss over the table with a group of 25 or 30 independent sales managers.

Q. You might elaborate on that a little further, if you will? A. Well, I can give you an example of something that occurred within the last 60 days.

7722 The sales executive conference was held in Hot Springs, Virginia, at which there were about 40 of the vice presidents in charge of sales of the different utilities throughout the

country present. At that conference was Frank Coffin and Harold Brooks and George Miller and myself, and the incident that I have in mind first occurred in the general meeting, at which the vice president in charge of sales of one of the large utilities in the country got up to discuss rates, line extension practices, and so forth, in connection with large

industry, and he mentioned the fact that a very special problem had arisen in connection with one industry, and then frankly stated, "I won't identify that industry, because Charlie over there I am quite sure is figuring on the same job".

Mr. Browning: He was pointing to you at that juncture?

The Witness: Yes, pointing to me. He called me "Charlie".

So after the general meeting adjourned, and I was 7724
sitting in social conference with the executives of our sister companies, I had identified this job to my own satisfaction, and I disclosed it to these men, and then I found out that Frank Coffin in Milwaukee was figuring on the same job.

Now as distinguished between the type of conversation that occurred between this gentleman who brought the matter up in the general meeting, and Frank and myself, Frank frankly told me all about the job and I asked him to send his rates and what 7725
he was doing in connection with that job, and he said that he would just as soon as he got back. He did send the data to me and not only sent me that sort of information but he sent me some very important information in connection with the type and char-

acteristics of the load that were totally different from my understanding of the characteristics of that load, and on which I had already made a proposal, and it caused me to quickly withdraw the proposal I had

already made and make another proposal to this prospective customer, which I sent to Frank, or a copy of which I sent to Frank, of course.

By Mr. Hamilton:

Q. Are these contacts with other sales managers of North American subsidiaries of value to the Union Electric Group? A. Yes, sir; I definitely think they are.

Q. Is your relationship with these sales managers of
7727 the North American subsidiaries different from your relationships with sales managers of non-affiliated companies? A. Oh, yes; there is quite a fundamental difference. In the case of the average sales manager of the general utilities, our discussions are largely confined to the broad fundamental basis of the sales problems, whereas my relationships with the sales managers of the North American subsidiary group, are in relation to the details of the specific objectives and how they are to be accomplished.

Mr. Hamilton: That is all.

7728 *Cross Examination by Mr. Binford:*

Q. Mr. Michel, throughout your testimony you have referred to the Union Electric "Group"? A. Yes, sir.

—3,262—

Q. I don't believe at any point so far you have definitely stated the names of the particular companies which you include in that group, as you speak of it. Will you please give those names? A. May I give them out of my papers? I have got them in my mind, but I would rather be specific about it.

Q. Surely. A. They are: The Union Electric Company of Missouri; the Union Electric Company of Illinois; the Iowa Union Electric Company; the St. Charles Electric Light & Power Company; the Lakeside Light & Power Company; and Mississippi River Power Company.

Q. You are vice president in charge of sales of the Union Electric Company of Missouri, is that correct? A. That is correct.

Q. Do you occupy any office or position with any of the other companies which you have identified as being included 7730
within your definition of the Union Electric Group? A. No, sir; I do not occupy any elective office, nor appointive office, with those, other than the charges that have been placed on me as to the general promotion and handling of the sales work for the entire Group.

Q. You didn't include in your term "Union Electric Group", the St. Louis County Gas Company? A. No, sir.

—3,263—

Q. You have nothing to do with the sales end of that company? A. No, sir; I do not.

Q. Are any of the members of the personnel working 7731
under your direction employed by any other company than the Union Electric Company of Missouri?

Mr. Browning: May I suggest that counsel define "employee" for the witness?

Mr. Binford: I think the term is one well understood, isn't it?

Mr. Browning: No, my point is that it would consist of at least two things: first, whether the employees of the sales department render any services

7732

for the other members of the Group; and, second, by whom they are paid for these services.

Mr. Binford: My question was not directed as to whether they perform services for the members of the Group, but as to who hired them and fired them.

The Witness: On the basis of your last remark as to who hired and fired them, no, sir, those men are not under me directly, not under my direct supervision for that purpose.

7733

By Mr. Binford:

Q. By whom are they employed in the first instance? A. By the district executives operating the different districts that I have named, of the subsidiary companies.

—3,264—

Q. Are they all on the payroll of the Union Electric Company of Missouri? A. Do you mean are all of the men——

Q. (Interposing) All of the personnel working under your supervision? A. Under my supervision?

Q. Yes. A. Yes, sir.

7734

Q. But excluding the district managers and district personnel of which you have spoken, is that true? A. Yes, sir; they are not under my group, but when you say "under my direction", their exact connection with one of the Group does not necessarily mean that I do not direct the operations of some of those men. I must give an example to explain what I mean.

In the case of the Union Electric Company of Illinois, just to take one single example, the merchandise manager of that company is almost exclusively directed by me, or

through me by the merchandise manager in the St. Louis office. He wouldn't dream of making a move in his merchandising operations without consultation with the headquarters group, as I call it.

Q. Can you state how many persons of the personnel operating under your general direction and concerning whom you have previously testified, is employed directly, that is to

—3,265—

say, is on the payroll of Union Electric Company of Mis- 7736
souri, as distinguished from the subsidiary companies? A. I can, I think, from the information that I have here.

302 out of a total sales personnel for the Group of 335.

Q. Upon what payrolls are the remaining members of the personnel in question carried? A. There are two on the payroll of the Lakeside Company, 21 on the payroll of the Union Electric Company of Illinois, and 10 on the payroll of the Iowa Company.

Q. Then is it correct to state that all members of the personnel operating under your general direction are carried on the payroll of the Union Electric Company of Missouri 7737
except 2, who are actually located at the Lakeside property, and 10 who are located in Iowa? A. And 21 in Illinois.

Q. And 21 in Illinois? A. Yes. They are on the payroll of the Union Electric of Missouri, but there is charged to these other companies portions of their salaries and traveling expenses incident to the trips that they make into those territories, and the work that they do for them.

Q. Could you state the aggregate cost, including salaries and wages, for the sales work that has taken place under

7738 *Charles E. Michel—By Respondents—Cross*

your direction for the calendar year 1939? A. I can, sir. As

a controlling percentage for the operation of the sales department of the Group, we set up 2½ per cent. of the gross revenue derived, of the gross sales, I should say, less inter-company sales, which are deducted.

For the year 1939, the total sales promotion expense, which covers supervision, salaries, commissions, demonstrations, and advertising, miscellaneous expense, and rents,
7739 amounted to $675,789.98.

Q. Do you also have the figures showing in dollars how that was allocated among the respective companies? A. I do not.

Q. But it was allocated upon the basis which you have indicated? A. Yes, this is a consolidated figure taken from the statements of all of the companies.

(Discussion off the record.)

By Mr. Binford:

7740 Q. Would you care to state again just how the allocation of that expense was made as among the respective companies involved? A. I can't give the accounting details on that, I am not entirely familiar with them. I do know that the men who are employed by the different companies, that their salaries and expenses are charged to those companies. I do know that a portion of the cost of the Union Electric Company of Missouri headquarters staff is allocated to other

companies when they go out and serve those other companies.

7741

Q. But you do not know the basis upon which that allocation is made? A. I do not.

Q. Do you know who makes that allocation? A. My answer would be a guess, and I would rather say that I do not know.

Q. Certain portions of the overhead expense of the sales department located in St. Louis are allocated, however, to the subsidiary companies of the Group, is that true? A. I would call them operating expenses rather than overhead. I don't know just what you mean by "overhead".

7742

Q. Let us say, for instance, such charges as rent and items of general supervision which can not be specifically attributed to one particular job, but which, nevertheless, are items of expense of the sales department—are those expenses not apportioned in some way among the companies supposedly benefited thereby? A. I would say that in the case of rent, no, they are not. The Union Electric Company of Missouri and its several divisions pay their own rents. I do not believe that those rents are apportioned between any other divisions of the company.

7743

However, I must say that I can not make a definite answer to that question, I am not familiar with the account-

ing procedure.

Q. You are likewise not familiar with any allocation that may take place as to advertising expense, I presume? A. No, sir; I do not know, I haven't it in my mind. They can get it for you (indicating Respondents' Attorneys), but I haven't it.

Q. You would say, would you not, however, that the promotional advertising, particularly of the merchandising

type, probably operates to the benefit of all companies in the Group as well as to the benefit of the Union Electric Company of Missouri? A. Yes, sir, it would, and that advertising is usually taken by the different groups and used in their own local papers, they placing their own advertising in their own papers. That is, the definite assignment of advertising to newspapers outside of the corporate limits of the City of St. Louis, is not handled by the St. Louis group, but by the men in direct charge of the divisions.

7745 Q. The St. Louis newspapers' circulation, however, as a matter of common knowledge, is not confined to the corporate limits of the City of St. Louis, is it? A. No, it is not; no, sir.

Q. I believe you testified that the Union Electric Group maintained 26 stores? A. That is correct, sir.

—3,269—

Q. Could you state the location of those stores, please? A. No; I can give you a number of them.

(Discussion off the record.)

7746 The Witness: No, sir; I haven't with me the exact location of those stores; I can name several to you, if you care to have an incomplete statement.

By Mr. Binford:

Q. Could you state approximately how many of those stores are located in the City of St. Louis? A. Yes, sir; four. And the original main office.

Q. All the other stores, then, are located in territory not served directly by the Union Electric Company of Missouri,

is that correct? A. No, sir; that is not correct. For instance, in St. Louis County, there are five stores; and in the outlying plants of the Union Electric Company of Missouri there are most of the balance of the 26 stores. You will find that at Lakeside there is one store, and in Illinois there are three stores; in Iowa there are three stores; and in the Union Electric of Missouri territory there are 19 stores.

Q. A these stores owned and operated by the particular companies in the service area of which the stores are respectively located? A. My answer would be an assumption. I 7748
know nothing about that, I think that is true, but I don't
—3,270—
know it.

Q. Who would have control of that situation, or knowledge of it? A. Well, I assume that one of the executives of the company would, one of the top executives.

Q. Do you know whether or not wholesale purchases or purchases from jobbers for these several stores are made jointly? A. We buy in St. Louis through our merchandising manager, and stock merchandise in our warehouse. That merchandise is drawn on by many of the different divisions. 7749
I cannot make the statement that all of it is so handled. I am under the impression that in the Illinois and the Iowa territory, their orders are placed direct, that they do not pass through the St. Louis organization. However, if they want any merchandise that we have in our warehouse, we would be glad to let them have it, and they would draw on it.

Q. When merchandise is so supplied to any subsidiary by the Union Electric Company of Missouri, do you know if it is supplied at cost to the Union Electric Company of Mis-

souri? A. You are in an accounting matter again that I really can't answer.

Q. I believe you testified yesterday that among the divisions of your sales staff, there was a group called a dealer sales group which handled the cooperation between your

organization and what you characterized as "the extensive dealer organization that is cooperating with the company throughout its district in the prosecution particularly of

7751 merchandising sales."

Now is there a dealer organization whose activities extend over the territory, over all the territory served by the Union Electric Company of Missouri Group? A. Your question, as I understand it, is: Does the dealer organization extend throughout the Union Electric Group?

Q. Yes. A. Certain of them are, certain of them are not.

Q. But no one particular group? A. I can say that the jobber group to a large extent would cover the entire district. I would say that practically no independent retailer covered any such group.

7752 Q. For instance, the dealer organization in Iowa would probably not be the same dealer organization that operated in St. Louis? A. No, sir; it would be a totally different dealer organization, excepting in so far as certain of the suppliers are concerned. The jobber is what I am referring to. The jobber who handles St. Louis in many instances handles the Keokuk district. I well know that, because when they have problems in Keokuk they come to me for advice on how to handle the situation. So that I happen to know the jobber situation. I also happen to know that there is no retailer of

merchandise in the St. Louis organization that is also a retailer in the Iowa group.

Does that answer your question?

Q. Yes. Now the jobbers' organization—is that a national organization or an organization covering the Middle West as a whole? A. There are 30 jobbers doing business in electrical merchandise in our territory. We will take, for instance, the Graybar organization. It is a national organization with its main headquarters in New York, and doing business in every large city in the United States, with local 7754
offices, and in all of the small cities through traveling men. That is just one of them.

We have local jobbers in St. Louis as well as national jobbers, they are of two kinds.

Q. Out of what jobbing center would the stores, let us say, in Keokuk, be served normally? A. I really couldn't answer that question.

Q. You wouldn't state positively that it would be St. Louis? A. I wouldn't say that positively, no, sir.

Q. In other words, the aggregate territory served by the Union Electric Group of companies is not such a territory 7755
as to be regarded as peculiarly one unit by the jobbers, is it? A. I would say that that statement is not correct. When we work up our campaigns, one of the important

—3,273—

things that we do is to pull the jobber organization in first, even before the dealer gets in. We ask his advice, we tell him what we are intending to do on a system-wide basis. We frequently alter our original plans by learning something from some man in the jobbing organization, and then

7756 *Charles E. Michel—By Respondents—Cross*

that jobbing organization, if it happens to be a national organization, passes it through to its home office for operation throughout the Union System, the Union Electric System.

Where it is a manufacturers' organization such as the General Electric, the Westinghouse, the Landers Frary & Clark Company, it goes through the manufacturer to all districts, because we send to those manufacturers details of the plans we intend to put in, together with the advertisements that we intend to run, and tell them, "Now get
7757 your gang behind this".

Q. However, you would not characterize the territory served by the Union Electric Company Group as constituting a natural, what might be described as a jobbing area, a single jobbing area, would you? A. Oh, yes, sir, I would. You take the concentration along the Mississippi River, Illinois, Missouri, and Keokuk properties, and they look to me like they would be covered by practically the same men. I can't make the statement that they are, but it looks perfectly normal that they should be.

Q. Just to clarify the record, I believe you referred yes-
7758 —3,274—
terday to the sale of electric ranges on your Group's line as representing a "saturation" of approximately 8.3 per cent. Does that mean that approximately 8.3 per cent. of the residential customers on these lines now possess electric ranges? A. That is correct, sir.

Q. It doesn't take into account the persons who are merely potential customers, but are not connected? A. No, sir, that figure is arrived at by taking the total sale of electric ranges in the district, making certain allowances for dis-

connects, and replacements, and then relating the ranges that remain connected to the total number of residential customers.

Q. I suppose the same observation applies to your statement that the saturation percentage in respect to electric refrigerators was approximately 87 per cent.? A. That is correct, yes.

Q. You testified that the problem of street lighting was a highly specialized problem, and you described somewhat in detail the procedure followed in attempts to sell street 7760
lighting systems to small cities. Is that work all handled under your direction? A. Yes, sir, the work of the surveys, the layouts, the proposals, and the sale of that final plan is handled under my direction.

—3,275—

Q. Your division handles appearances before municipal councils or local governing bodies that may be necessary in that connection? A. If we are asked to do so, yes, sir, we do; yes, sir.

Q. That is not handled in any instances by the executive officers of the company or by the attorneys of the company? 7761
A. "Any instances" is a pretty broad statement, and I can't make that general statement. But not to my knowledge I can say.

Q. I believe that you testified you entered the service of Union Electric Company of Missouri in 1907 as manager of the electric automobile department? A. That is correct.

Q. Had you had any connection with the public utility business before that time? A. I graduated and went directly to the Burlington Railroad. I graduated in 1896 and

7762 entered the service of the railroad after two months' summer vacation, and was continuously with the Burlington Railroad until I transferred to the Union, and I have held but two jobs in my life.

In the Burlington Railroad my experience was first as a clerk in the advertising department, then assistant to the advertising manager, and then traveling passenger agent in the most densely populated territory that the Burlington had.

7763 Q. Then, other than with the Union Electric Company Group, and the special work that you did in Milwaukee, con-

—3,276—

cerning which you have testified, you have not been otherwise employed at any time by the North American Company or by any of its other subsidiary companies? A. When you say "employed", do you mean paid money by them?

Q. Yes. A. No, as far as I know I have never received a check from anybody except the Union Electric Company of Missouri and the Milwaukee Electric Railway and Light 7764 Company. But to be technical, if my salary is apportioned on work that I do for these other divisions, then I would say that from a salary standpoint I must be employed.

Q. But as to that apportionment, you do not know? A. I do not know, I can't answer that.

Mr. Browning: That last answer of the witness was relating to other members of the Union Electric Group, I take it.

The Witness: Entirely.

By Mr. Binford:

Q. And now you testified yesterday in respect of developments fostered by the Union Electric Company Group as to the melting of gray iron? A. Yes, sir.

Q. I believe you stated that St. Louis was one of the first cities where that was successfully carried through? A. Yes, sir.

—3,277—

Q. By means of an electric furnace? A. Yes, sir. 7766

Q. Where was that process originated? A. At the McQuay-Norris Piston Ring Company in St. Louis.

Q. However, it had been originated, that is to say the method, before your company adopted it, had it not, and fostered it? A. I may answer that question in this manner, that the industrial heating engineer employed by our company at that time told me that that was the first installation of an electric furnace for the heating of gray iron for the type of iron that was desired, at any place in the United States. I do not know that to be a fact from personal knowledge. 7767

Q. And you don't know where the idea came from? A. No, I can't tell you where the idea came from.

Q. Now, as to a second development of which you spoke, namely, infra-red heating, I believe you stated that that was developed in the Ford Motor Company plant? A. Yes, sir.

Q. And thrown open to the public? A. That is correct.

Q. Since which time your company has promoted its use? A. Extensively. Possibilities of that type of installa-

—3,278—

7768 tion are limitless, and we are working on innumerable different jobs, some of which are entirely original. There is a job going on in St. Louis today, which I cannot speak of, but it has to do with the preparation of mirrors in which infrared heating is concerned; that, if successful, will revolutionize the industry.

Q. Now in speaking yesterday of the industrial heating division of your sales organization, you said: "The results of the promotion by this division I can sum up very quickly",
7769 and then you continued as follows:

"The load in ten years has been increased by 27,713 kilowatts, and at the present time, that is, as of January 1, 1940, stands at 83,815 kilowatts."

You do not mean to indicate, I assume, that that increase in load was due solely to the promotional activity of the particular sales division which you mentioned? A. The word "solely" makes me answer that no, but I will say that that load, a large portion of it, a very large portion of it, is due to the promotional and intelligent information and advice given to manufacturers by the industrial sales force
7770 of the Union Electric Company of Missouri.

Q. Isn't it true that in the past ten years, industrial loads throughout the electric public utility industry in general have risen at a somewhat comparable rate? A. I don't know the percentage at which it has risen, but you are talking now

—3,279—

of a specialized load and not of a general load. You take the general load in the industrial business and it goes up, but when you talk of industrial heating, it is another matter. Now, if you are referring just to the work done by the indus-

trial salesmen, that covers preliminary work on heating as well as the general power work, and of course that man has not been responsible for all of that load. He may have been responsible for a very large percentage of that load, because there is nothing but 50 kilowatts and up in there. And when he goes into a factory and shows a factory manager how to change from one process to another, which uses the electricity, he is only one factor in the ultimate change that is made, but he is quite an important factor, and we try diligently to be the original factor in that, by bringing to the 7772
attention of these manufacturers the possibilities of a change from some other type of power or heating or lighting, or air conditioning, and so forth, to the modern electrical type.

Q. But you do not know, do you, whether the particular increase in this specialized load for the past ten years in your group is materially higher than the growth of the same specialized load in the industry as a whole? A. Now before I answer that, I am somewhat confused in reference to your figures and statement. If you are speaking of the industrial sales staff and their achievements, that is one thing. If we are talking about the industrial heating job, that is a totally 7773

—3,279-A—

different group, a totally different method of operation, and I don't know which one to talk about.

Q. Will you please turn to the transcript of the testimony of yesterday, at page 3,206 and toward the bottom of the page you will notice the figures which you gave yesterday. A. This is in reference to the industrial heating load.

Q. Now that is the load of which I have been speaking. A. Well, you see I am speaking of two different loads. I

7774 *Charles E. Michel—By Respondents—Cross*

have been talking of the general power load, which is gotten by the general power salesmen, and the industrial heating load, which is gotten by the industrial heating division, and this has to do with a highly specialized type of operation.

Q. Well, is it clear now of which load I am speaking? A. It is.

Q. Now with reference to this specific load, I again ask if it is not true that the increase during the past ten years in the industry as a whole, of this specialized type of load, 7775 has not been somewhat of the same order as the increase as shown by your company? A. I can't answer the question, I don't know the national figure on the increase in industrial heating load, and I coulda't answer it unless I did know that figure.

Q. Therefore, you would not, on the basis of your present information or lack of it, claim that this increase was

—3,280—

unique with the Union Electric Group? A. Well, my lack of information has to do with national figures, which I don't carry in my head. That is almost impossible. I do believe 7776 that the achievements of the St. Louis industrial heating group have been outstanding when you consider the type of the city, of its industrial life, and the lack to a large extent of users of very large furnaces, such as are found in some of the eastern cities, such as Pittsburgh, and places of that kind. We have not that type of load available to us, but when you consider the type of load that is available in St. Louis, I think that they have done an outstanding job.

Q. You would say, then, that each territory served by a utility must in general be judged by its own peculiar

characteristics, is that true? A. I would say that that is true, when you are talking again of specified loads at this time, and that is what we are discussing, as I understand it, and that is true, because it is perfectly obvious that if there does not exist in the territory the types of business that can use very large electric furnaces, and other special equipment of that kind, that that utility simply can't pick up additional industrial heating load to the same extent that it can be picked up in some other district that happens to be saturated with the type of business that uses that type of 7778
furnace.

—3,281—

Q. The same thing is true, is it not, as to residential loads, particularly when you have such type of territory as you described in the rural area near the Ozarks? A. What do you mean by "the same thing is true"?

Q. That is, as to each territory having its own problems which are very distinct from the problems of another utility, let us say. A. The basic, fundamental problems are much the same, but they are definitely influenced by the type of community that is to be served, yes, sir, that is true. 7779

Q. You spoke yesterday, and amplified your remarks this morning on direct examination, in respect to the LaClede Power & Light Company's operations. A. Yes, sir.

Q. The operations of that company are in direct competition with the operations of the Union Electric Company of Missouri in the city of St. Louis, are they not? A. That is correct.

Q. That their lines are parallel to each other? A. Through a certain section of the city. As I believe I have

7780 already testified, in the southwest section of the city, where the density of population is not what it is in most other sections, they have no lines at all, they haven't extended their lines into that territory.

Q. Do you cooperate with that company in advertising, or otherwise? A. I do not.

—3,282—

Q. I presume they also advertise, or do you know? A. No, sir, the LaClede Power & Light Company does not ad-
7781 vertise and promote the use of electrical merchandise through the residential customers in the manner in which I am talking about.

Q. But they, I would infer, probably benefit from your promotion along those lines, is that correct? A. You put your finger on it.

Q. Now you spoke of the program of the Union Electric Group, of rural electrification? A. Yes.

Q. And described the methods used in promotion and in extension of lines? A. Yes.

7782 Q. This extension of rural electrification has been primarily from the St. Louis area, has it, rather than from Keokuk or somewhere else? A. You mean the extension into the rural districts?

Q. Yes. A. In the Missouri territory, you mean, rather than St. Louis?

Q. I mean has it been in the Missouri territory? A. It has been primarily there because the vast majority of our

—3,283—

rural territory lies in Missouri. We have a very, very meager amount of rural territory around the Keokuk prop-

erties, and a very small amount around East St. Louis and Alton. The territories there, both of them, are practically covered, because they are just little fringes around the cities. We have no real rural territories other than in Missouri, to any extent.

Q. Now your rural extension program around and out from the St. Louis service area has been, has it, into territory not served by any electric utility prior to your entry into the field? A. You mean that we have not extended our lines into some other utility's territory, and taken their lines? 7784

Q. Yes. A. No, excepting that we have acquired different utilities out in those districts, and as we have acquired them, we have extended the system out in those towns, and most of those were in little towns.

Q. But other than your acquisition of systems, your extension of lines has been to serve people not theretofore served by electricity, is that true? A. That is correct, sir, within the territory in which we hold certificates of necessity and convenience.

The Examiner: We will take a short recess. 7785

(A short recess is taken, after which the hearing is resumed.)

—3,284—

The Examiner: Let us resume.

By Mr. Binford:

Q. Now in connection with the rural electrification program, I believe you testified yesterday that your group caused a magazine, "Electricity to the Farm", to be mailed to 1,200 farmers, possibly, each month without charge? A. Yes, sir.
